International Electrotechnical Commission.—At the recent Council meeting of the International Electrotechnical Commission, which was opened by Mr. A. J. Balfour in October last, the question of an international unit of light was brought forward by the French Electrotechnical Committee. The proposition of the French delegates was, however, adjourned in order that the electrotechnical committees in the different countries might have an opportunity of further studying the subject. The Council also recommended that the committee in each country should endeavour to arrange matters in such a way as to satisfy the needs of both the gas and electrical industries. Considerable progress has been made here, and the British Committee has now appointed a sub-committee, under the chairmanship of Dr. R. T. Glazebrook, F.R.S., to go fully into the details of the question. Dr. Glazebrook will be assisted by Dr. S. P. Thompson, F.R.S. (British delegate to the Commission), Prof. C. V. Boys, F.R.S., as official representative of the "Gas Referees," and Mr. J. W. Helps, M.Inst.C.E., officially nominated by the Institution of Gas Engineers. With the cordial co-operation of the gas industry thus obtained, it is hoped that the sub-committee may be in a position to report at no distant date, especially in view of the experiments lately carried out at the National Physical Laboratory, which are said to point to the probability of an eminently satisfactory solution.

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

Experiments were made on Tuesday on the G.B. surface-contact line of the London County Council which indicate that there is every prospect of traffic being resumed at an early date. (Page 226.)

In his fourth Cantor lecture before the Royal Society of Arts on Monday Mr. Leon Gaster dealt with the physiological aspects of the subject of illumination. The lecturer emphasised the importance of concealing lamps of high brilliancy, or at least enclosing them in diffusing globes, and suggested that illuminants of high intensity should not be allowed to be used for advertising purposes outside shop windows. The importance of efficient illumination in schools, and the alleged dangers consequent upon the increased proportion of ultra-violet rays emitted from modern illuminants, were also dealt with. An American investigator has carried out some experiments which prove that the intrusion of a foreign lamp into the field of vision lessens one's ability to read by a large percentage by causing the pupil of the eye to contract. (Page 226.)

The hearing of the appeal against the decision of the Comptroller of Patents to revoke the Bremer flame arc lamp patent, under the Revocation Clause of the new Patents Act, was commenced yesterday morning. (Page 226.)

We are able to give some particulars of two 750-kw. continuous-current turbo-generators manufactured by Messrs. Siemens Brothers Dynamo Works, Ltd., which are now running in the Dickinson Street station of the Manchester Corporation. (Page 227.)

We give a brief description of the engineering shops at the Ponders End works of the Edison & Swan United Electric Light Co., Ltd. The manufacture of all the various lighting and power accessories produced by the company is carried on in these shops, which, together with the lamp factory, cover an area of over eleven acres. Power is distributed throughout the works at 165 volts, three-phase, from a transformer sub-station supplied from the mains of the North Metropolitan Electric Power Supply Co. (Page 228.)

The change over to the new central battery equipment of the Great Yarmouth telephone exchange of the National Telephone Co. was effected last Thursday. (Page 230.)

Digitized by Google

A DEMONSTRATION was given last week at the works of Messrs. W. H. Allen, Son & Co., at Bedford, of the running of a group of paraffin engines suitable for small generating sets and other purposes, which the firm are placing on the market. The engines are readily started up without the use of any other fuel but paraffin, and steady running at all loads is ensured by an efficient throttle governor. (Page 231.)

IN an interesting Paper read at Budapest last year, the head of the technical service of the Austrian telegraphs spoke highly in favour of automatic telephone exchanges, and gave a brief account of the result of his tests and investigations with an experimental Strowger system in Vienna, to which the Austrian Telegraph Department had added several improvements. (Page 232.)

WE describe in some detail the transformer sub-station installed by the North Metropolitan Electric Power Supply Co. in the Ponders End works of the Edison & Swan United Electric Light Co. for the supply of light and power to the engineering shops and the lamp factory. (Page 231.)

SOME trials of the Bellini & Tosi system of directive wireless telegraphy have been conducted by the German Army authorities, which fully confirm all that has been claimed for the directive capabilities of the system. (Page 233.)

A PAPER was read by Mr. T. Swinden before the Leeds Local Section of the Institution of Electrical Engineers describing a research on the magnetic properties of steels containing a definite quantity of tungsten and varying quantities of carbon, from which it would appear that there is a definite proportion of carbon to tungsten most suitable for permanent magnets. (Page 234.)

IN a Paper read in London last week, Mr. R. Borlase Matthews dealt with the commercial side of the management of supply undertakings, emphasising the need of effective advertising and organised canvassing. A modified contract demand system of charging was proposed, and some representative costs of circularising were given in the Paper. (Page 235.)

A SHORT article describes some experimental work which has been made in the English and American navies and in France with the De Forest system of wireless telephony. (Page 235.)

A PAPER was read recently by Mr. Holt before the National Association of Colliery Managers, in which the electrical generating plant at Bargold Colliery was described. The two largest alternators are driven by gas-engines of 1,200 and 2,400 b.h.p. respectively, running off coke-oven gas, and a 500-kw. alternator, driven by a Rateau exhaust steam turbine, taking steam from the main winding engines, is also provided. (Page 235.)

AN electromagnetic emergency brake, by which shafting can be immediately stopped from any part of a workshop by means of push-buttons, has been developed by the Felten-Guilleaume Lahmeyerwerke Co. (Page 236.)

A WATER-POWER station supplying current chiefly for electrolytic purposes has recently been put to work at Martigny in the Rhone Valley. A supply, partly at 150 volts and partly at 300 volts, is given to the neighbouring electrolytic works by a group of five 750-kw. continuous-current sets, and three 1,500-kw. 10,000-volt alternators are also provided for the supply of a works at a distance over a transmission line. The hydraulic work involved a considerable amount of tunnelling through the rocks. (Page 237.)

THE Finance Committee of the London County Council recommends that the application of the St. Marylebone Borough Council for a loan of £8,000 for replacing 1,964 incandescent gas lamps by metal filament lamps should not be granted. The reasons given are that as the Council only proposes to put in the same amount of illumination, and there have been no complaints as to the present lighting, there is little to be gained, especially as the estimated cost of the supply is considerably lower than the present average cost, viz., 0·53d. per unit against 1·38d. per unit. (Page 239.)

THE hearing of the summons taken out against Mr. W. H. Keys, of West Bromwich, for selling as "genuine Trinidad bitumen" a composition consisting of manjak, oil, clay, and gypsum, was concluded before Mr. Chester Jones at the Thames Police Court on Monday, but the magistrate has deferred his decision. (Page 240.)

THE Dublin Corporation have taken out summonses against the Tramways Co. for alleged failure to maintain their track.—An increase in the rates of 5d. in the £ is anticipated at Cardiff mainly owing to the tramways and electric supply undertakings.—The Hastings Corporation is being urged to dispose of their electricity undertaking.—In order to put the Reigate electricity undertaking upon a good financial basis, the charges are to be increased.—The resignations of the chairman of the Salford Electricity Committee and three members have now been officially received.—The Local Government Board have asked the West Ham Corporation for the power contracts discussed at the recent inquiry, for their private perusal.—The construction of an electric railway in the Birkenhead and New Brighton district is being discussed. (Page 240.)

TURBO-ALTERNATORS are required by the Sydney Corporation; electrically-driven pumps at Grays (Essex); a battery, &c., at Manchester; and a 300-kw. three-phase induction motor at Brighton. The Local Government Board inquiries have been held at Bolton (£25,000), Mexborough (£4,000), and Yarmouth (£2,500). Loans have been sanctioned at Carlisle and Wednesbury. Tramcars are required at Accrington and Rotherham. (Page 242.)

IN order to pay a 5 per cent. dividend on the ordinary shares, the sum of £1,000 has been taken from the reserve fund of Messrs. O. C. Hawkes. A net profit of £12,901 is shown by the accounts of the County of Durham Electrical Power Distribution Co. for 1908, and £49,148 by the accounts of the Newcastle-on-Tyne Electric Supply Co. The Metropolitan Electric Supply Co.'s accounts for 1908 show a balance of £55,972. The Newcastle & District Electric Lighting Co.'s accounts show a net balance of £17,864, and the accounts of the City of London Electric Lighting Co. and the County of London Electric Supply Co. show net profits respectively of £90,443 and £101,037. (Page 244.)

IN a flywheel load-equalising set, patented by the British Thomson-Houston Co., Ltd., T. E. Robertson, and F. Holden, the speed of the flywheel can decrease without a corresponding increase in the motor current, as a counter e.m.f. is automatically introduced into the motor circuit by an auxiliary machine. Among the other specifications published by the Patent Office last Thursday was one by J. W. Howell for a method of making joints between tungsten filaments and leading-in wires by covering the filament with a metallic paste at the joint and sintering the whole together. Opposition has been entered to the grant of two patents, one relating to the manufacture of metal filaments, and the other for a motor-generator for delivering constant current. The patent for "Uralite" fireproof insulating material, and another by the British Thomson-Houston Co. for a meter for heavy work, expire during the current week. A feature of the Patent Record this week is the large number of traction patents that have been dropped. (Page 247.)

The Finance Committee of the London County Council has recommended that an application by the Marylebone Borough Council for a loan of £8,000 for street lighting purposes should not be granted, and sets out at length, in a report which we give elsewhere in this issue, its reasons for this decision. This proposal for the conversion of some 2,000 incandescent gas lamps to metal filament lamps has occupied the attention of the Marylebone Council for several months, and competitive offers made by the Gas Light & Coke Co. have been considered. We do not agree with all the various arguments contained in the report, although there is something to be said in favour of the recommendations. In the first place, it is only now brought out that so recently as 1903-4 the sum of £11,000 was spent upon substituting incandescent gas lamps for the original flat-flame burners. The whole of this has been borne by the rates, and no provision is made for dealing with this capital expenditure in the estimates now put forward for electric lighting. On the other hand, the report, whilst throwing some doubt on the accuracy of the estimates put forward by the Electricity Committee for the proposed scheme, in no way substantiates its criticism. Another somewhat weak argument put forward by the Committee against the scheme is that the gas company by taking a 50 per cent. higher illumination is able, by correcting the Council's estimates accordingly, to put in an offer comparing more favourably, but as the Council consider their standard of illumination is sufficient, the comparison is somewhat beside the mark. Probably the strongest argument in the report is that in view of the enormous capital expenditure upon the Marylebone electricity undertaking, the only prudent course to adopt is to restrict further capital expenditure except in absolutely necessary directions, especially as the benefit to the electricity undertaking will be comparatively small, and there has been no complaints from the ratepayers about the present illumination. Another somewhat doubtful feature of the scheme is the allowance of a rebate of 25 per cent. by the Electricity Committee to the Borough Council, as a large consumer, for prompt payment. Therefore, all things considered, it is not surprising that, notwithstanding the fact that the better economy of the electrical scheme has in no way been disproved, the County Council have disallowed the loan. It is not impossible, however, for the scheme yet to be carried through, as the Borough Council can still appeal to the Local Government Board for powers to borrow the money; and even if this should be refused it is open to the Borough Council to defray the cost of the conversion out of revenue.

Our readers will remember that at the summer meeting of the Verband Deutscher Elektrotechniker last year a Paper was read in which the authors called attention to the increasing proportion of ultra-violet rays in the light emitted by modern illuminants, particularly by metal filament lamps and arc lamps. These rays, they contended, were liable to cause serious harm to the eyesight, if provision were not made for their absorption by enclosing globes of a special glass. About the same time another investigator put forward the results of some experiments, which showed that the proportion of ultra-violet rays in the light from electric lamps was not greater than in sunlight, but drew attention to the harmful effect on the eyes of using naked sources of light of high intrinsic brilliancy placed directly in the field of vision. Abstracts of these were given in Electrical Engineering, August 27th, p. 312, and in commenting on these in the same issue we explained the reason for this latter effect, and pointed out that if the light were well diffused and no rays of a brilliancy much over the average were allowed to impinge on the retina, artificial light should cause fatigue of the eyes no sooner than daylight. In another part of this issue will be found an abstract of a Paper by an American investigator which gives the results of some quantitative experiments in this direction. It was found that the intrusion of a single 16-c.p. lamp into the field of vision decreases one's ability to read by approximately 30 per cent., chiefly because the pupil contracts under the influence of the direct rays of high intensity from the foreign lamp. The sharpness of the image of the type on the retina is affected, and there is also a harmful excess of light on the portion of the retina where the image of the foreign light source is thrown. These results emphasise once more the necessity for concealed lighting, or, at any rate, the use of diffusing globes or shades where lamps of high intrinsic brilliancy are employed. It is, however, a difficult matter to convince the ordinary householder that a uniform illumination of comparatively low intensity produced with the aid of diffusing globes or lamps hung out of the angle of vision is better in all respects than a brilliant illumination obtained by the use of the same lamps hung naked in the field of vision. In his lecture before the Royal Society of Arts on Monday, Mr. Gaster dealt at some length with this subject, and to show that the matter was more serious now than formerly, quoted some figures obtained experimentally by Dr. Stockhausen for the intrinsic brilliancy of different light sources. Whereas the brilliancy of a bright sky was equivalent to 3·5 candle-power per square inch, the carbon filament gave 450, and the metal filament 1,100 candle-power per square inch. With all this evidence before us it cannot be denied that the time has come for greater attention to be paid to the manner in which lamps are used, although it should hardly be necessary to act on Mr. Gaster's suggestion and introduce legislation on the subject.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 11th.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster. Paper to be read :—"The Dielectric Strengths of Compressed Air," by E. A. Watson.

Institution of Electrical Engineers: Dublin Section.

8 p.m. Meeting at the Royal College of Science. Paper to be read, "The Testing of Live Mains," by R. G. Allen. The reading of the Paper will be followed by an exhibition of electric cooking ranges.

FRIDAY, MARCH 12th.

Northampton Institute Engineering Society.

5.45 p.m. Meeting at the Institute, St. John Street, Clerkenwell, London. Paper to be read, "Smoke," by Mr. W. Longland.

Physical Society.

8 p.m. Meeting at the Imperial College of Science, Imperial Institute Road, South Kensington. Agenda :—(1) A. E. Garrett, B.Sc., "The Effect of Radiations on the Brush Discharge." (2) E. C. Snow, B.A., "On Pirani's Method of Measuring the Self-inductance of a Coil." (3) W. S. Tucker, B.Sc., "Exhibition of a High-potential Primary Battery." (4) H. S. Rowell, "On the Least Moment of Inertia of an Angle-bar Section."

Royal Institution.

9 p.m. Evening Discourse on "Modern Submarine Telegraphy," by S. G. Brown.

Digitized by Google

SATURDAY, MARCH 13TH.

Birmingham and District Electric Club.

7 p.m. Meeting at the Colonnade Hotel, New Street, Birmingham. Paper to be read:—"Reducing the Cost of Power in Works and Factories," by J. A. Jeckell.

Northampton Institute Engineering Society.

7.30 p.m. Annual Dinner at the Holborn Restaurant.

MONDAY, MARCH 15TH.

Junior Institution of Engineers.

7.30 p.m. Meeting at the Royal United Service Institution, Whitehall, London. Paper to be read:—"The Use of Dielectrics, and the Principal Tests applied to them," by T. Germann and S. M. Hills.

TUESDAY, MARCH 16TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. Annual General Meeting at the Municipal School of Technology, Manchester. Paper to be read:—"Electrolytic Zinc Manufacture," by F. Moore.

WEDNESDAY, MARCH 17TH.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. Meeting at 92 Victoria Street, London, S.W. Paper to be read:—"Central Station E.H.T. Switchgear and Control," by E. F. Hetherington.

THE L.C.C. SURFACE-CONTACT TRAMWAYS

SOME important and interesting tests were made on the surface-contact lines of the L.C.C. tramways during the small hours of Tuesday morning. A section of the line had been fitted with the modifications suggested by Mr. W. M. Mordey, and the result of the tests goes to show that in all probability the troubles experienced with the G.B. surface-contact system under the difficult conditions which have to be met will be successfully overcome. There is every reason to believe that before many weeks have passed the system will be once more in regular operation.

It will be remembered that after a few weeks of somewhat intermittent traffic with a few cars fitted with a temporary equipment, the service was abruptly discontinued on account of certain troubles and on account of a deadlock between the Council and the G.B. Company. Mr. W. M. Mordey was called in to report as to whether the difficulties were incidental to the system or could be satisfactorily overcome.

ARTIFICIAL ILLUMINATION AND THE EYES

IN his fourth and last Cantor lecture before the Royal Society of Arts on the subject of modern methods of illumination, Mr. Leon Gaster dealt with the physiological aspect of the subject, which, as he pointed out was of immense and growing importance, and deserved careful study. Our eyes were by nature adapted to a diffuse illumination, but not necessarily to one of constant value; indeed, the intensity of daylight varied, within very wide limits, over the period of a day and also with the period of the year and the locality. Nature had provided for these differences by enabling us to vary the diameter of the pupil and the amount of light let into the eye, but it was evident that we were not intended to gaze at bright sources of light. Dr. Stockhausen had shown that, whereas the intrinsic brilliancy of a clear sky was about 3·5 c.p. per sq. in., the figure for a petroleum flame was 20, for a carbon filament 450, for a metal filament 1,100, and for the crater of an arc 17,000 c.p. per sq. in. Apart from the evident discomfort which resulted from having such sources of light as the metal filament and the naked arc in the field of vision, it was certain that it was unnatural, and might lead to disastrous consequences. Here the lecturer pointed out, however, that he had no intention of condemning such illuminants as unfit for human use: he only wished to emphasise the fact that any bright illuminant should be placed out of the field of vision. Now that lamps of comparatively high efficiency were to be obtained, there was no excuse for not properly diffusing the light.

With regard to the lighting of shop windows, Mr. Gaster referred to the haphazard way in which the new metal filament lamps were being hung amongst the objects exhibited; the lamps should be screened in the direction facing the street, and the light should be thrown on the objects and not on the eyes. Direct rays from any light source were to be considered as a raw product; reflected rays were all that should reach our eyes. The indiscriminate use of flame arc lamps, more for advertising than for illuminating purposes, was also to be deplored, especially when used outside shop windows in narrow streets. Mr. Gaster even went so far as to suggest that this should be forbidden by law.

A large number of opal and cut-glass diffusing globes were exhibited by the lecturer, and some lantern-slides illustrating the harmful contrasts obtained with local illumination were shown. Opal glass shades absorbed from 17 to 24 per cent. of the light from the source, but clear glass only from 9 to 14 per cent., and if the clear glass shade was cut or moulded prismatically in a scientific manner, the above loss was fully compensated for by the larger proportion of light which was thrown in the directions where it was wanted. The more ideal, but rather inefficient, indirect or inverted lighting system, was also briefly dealt with. After referring to the various patterns of photometers, including those designed to measure illumination, the ordinary candle-power photometers, and the integrating globe photometers, Mr. Gaster referred at some length to the lighting of school-rooms, emphasising the necessity for efficient and proper illumination for the preservation of the children's eyesight. Legislation on this subject was sorely needed.

Another interesting and important aspect of the question was the alleged harmful effects of the ultra-violet rays, and, dealing with this, the lecturer referred to the papers of Drs. Schanz and Stockhausen before the Verband Deutscher Elektrotechniker, and that of Dr. Voege, abstracts of which were given in ELECTRICAL ENGINEERING, Vol. IV., page 312. Some samples of the glass prepared by the former investigators, and known as "Euphos" glass, for absorbing ultra-violet rays, were also exhibited. It was quite certain that the eyesight was seriously affected by continuous exposure to ultra-violet rays, but there was not yet sufficient evidence to show that the illuminants in use at present were particularly harmful in this respect. In the case of the Küch high-efficiency quartz-tube mercury vapour lamps, however (see ELECTRICAL ENGINEERING, Vol. IV., page 704), it had been proved that a very large proportion of ultra-violet rays were emitted, and though these were admittedly of considerable use in certain industrial and medical operations, their presence rendered the lamp unsuitable for general illuminating purposes, in spite of its high efficiency.

The above concludes our report of Mr. Gaster's lecture, but before leaving the subject, the following results of some experimental work, published by Prof. S. W. Ashe, in the *Electrical World*, New York, may be mentioned. This work is being carried on at Columbia University, with the co-operation of the United States Departments of Physiology and of Physics. Experiments had proved that there is a difference in the visual acuity for illumination of different colours but of the same intensity, it being easier to read with blue or white light than with red light of equal intensity. Measurements were also taken of the diameter of the pupil of the observer's eye when under the influence of a foreign lamp placed at different angles in the field of vision, and it was found that as the lamp was brought into the field and the angle became shorter and shorter, the pupil contracted more and more. This lessened the amount of light which entered the eye, and rendered the objects viewed indistinct. There was still an excess of light impinging upon the retina to one side of the fovea, however. It was found that the presence of a foreign lamp in the field of vision decreased the ability of the subject to read by approximately 30 per cent. for an ordinary 16-c.p. carbon filament lamp.

REVOCATION OF THE BREMER PATENT

Hearing of Appeal

THE hearing of the appeal by the British Westinghouse Co. against the decision of the Comptroller to revoke the Bremer Patent was commenced yesterday morning in the Chancery Division of the High Court before Mr. Justice Parker. A full report of the decision of the Comptroller and an abstract of the patent in question were given in ELECTRICAL ENGINEERING, Feb. 11th, 1909, page 143. In opening the case for the appellant, Mr. A. J. Walter, K.C., outlined his interpretation of section 27 of the new Patents Act, and argued that it was irrelevant to take into account the importation into this country of similar articles, which might be either infringements or articles not manufactured by the patentee or his licensees. With regard to the meaning of the phrase "adequate extent," this he construed as meaning "adequate extent in so far as a demand for the patented article existed in the United Kingdom." He admitted that of the lamps manufactured under the patent and sold in this country, the majority were manufactured abroad, but held that the company had sufficient reasons for not manufacturing to a larger extent in this country. Considering these reasons, counsel thought that his clients were not using their patent rights in a manner unfair with regard to this country, and that therefore the patent should not be revoked.

CONTINUOUS-CURRENT TURBO-GENERATORS AT MANCHESTER

THROUGH the courtesy of Messrs. Siemens Brothers Dynamo Works, Ltd., we are able to give some particulars of a pair of continuous-current turbo-generators which this firm have recently supplied to the Manchester Corporation and which are now running at the Dickinson Street station. The machines are of interest, as representing the latest form of the Siemens' design of continuous-current turbo-generators, and they embody a number of features which are the result of considerable pioneering work in this direction.

The sets are each of 750 kw. output at 500–550 volts over-compounded, or from 400–480 volts when running as shunt-wound generators. They run at 1,600 r.p.m, and have an overload capacity of 25 per cent. for one hour. A single machine is used for each set, as it is no longer necessary to employ two machines in tandem for these outputs and speeds. A view of one of the generators is shown in Fig. 1, from which it will be seen that the four-pole magnet frame and armature are enclosed in a housing which permits of an efficient method of ventilation being adopted. The "chimney" forming the exit of the heated air is clearly shown in the illustration. With machines of this size ventilation by external fans, such as is adopted in the case of the 6,000-kw. Siemens' turbo-alternators at the other station of the Manchester Corporation at Stuart Street, is not necessary. The cool air enters under the floor at the end of the machine nearest to the turbine.

The principal features of the electrical design of the machines are the use, in accordance with the most modern practice, of compensating windings embedded in the faces of the main poles, as well as commutation poles. Carbon brushes only are employed in a special pattern of brush holder, and the commutator, the bars of which are held in place as usual with steel shrunk rings, is kept within reasonable dimensions by the employment of the Siemens patent system of internal ventilation (see ELECTRICAL ENGINEERING, Vol. II., page 883). The segments, instead of extending the full length of the commutator, are sub-divided into two axial halves, and a simple form of centrifugal fan, placed under the perforated cover, seen in the illustration, is placed between them to draw air through the longitudinal tunnels provided in each segment.

The two machines were tested before erection on site by the Hopkinson method, and the efficiencies obtained are shown in Fig. 2.

It will be noted that the efficiency is not only high, but varies very little over a wide range of output. After a six hours run on full load the average temperature rises for the two generators were as follows:—

Armature	...	...	31·5° C.
Commutator	...	...	19·25° C.
Field system	...	...	37° C.

During this test the commutation was sparkless.

After the temperature test, the machine working as generator was loaded with 200 amperes 500 volts. It was then short-circuited through a circuit-breaker set to trip at 500 amperes. The machine did not flash appreciably, but behaved very satisfactorily. The current was subsequently increased to 350 amperes, and was switched on and off several times without producing any visible effect on the machine.

THE EDISON & SWAN CO.'S ENGINEERING SHOPS

THE following is a brief description of the engineering shops at the works of the Edison & Swan United Electric Light Co., Ltd., which are

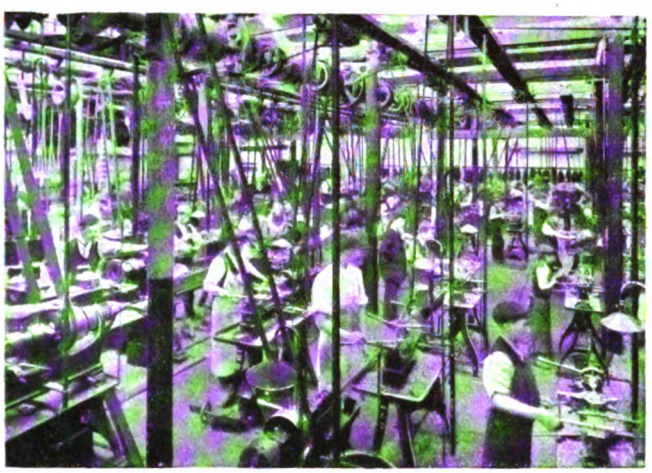

Fig. 1.—Turret Shop.

situated on the Lea Navigation at Ponder's End. Including the lamp factory, where both carbon and metal filament lamps are manufactured, and which

Fig. 2.—Automatic Tool Shop.

is adjacent to the engineering shops, the total ground area covered by the works amounts to eleven acres. The original works were established over twenty years

Fig. 3.—Brass Shop.

ago, but a large number of new buildings have been erected, and the works now cover over double the original space.

In that portion of the works known as the engineering shops, the manufacture of all the lighting and power accessories produced by the company, with the exception of incandescent lamps, is carried on. Of the

Fig. 4.—Switchboard Shop.

buildings devoted to this work, the second largest is used for stores, and here are kept, besides the raw materials, a small stock of various unfinished and made-up parts. This stock is added to, or taken away

Fig. 5.—Press Shop.

from, according to whether the intermediate shops turn out more or less of their particular products than are required by the finishing shops. All the various

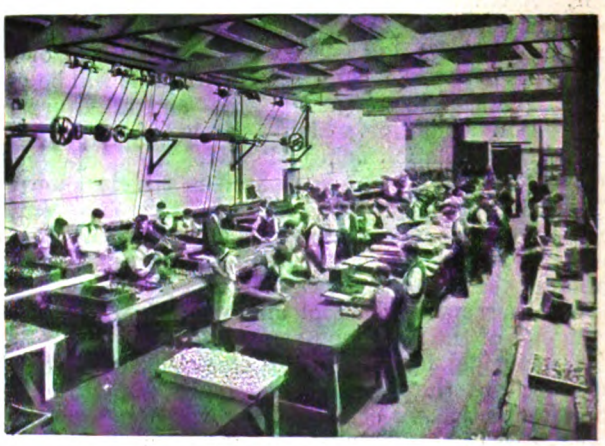

Fig. 6.—Holder Shop.

kinds of raw material are arranged and classified in a systematic manner, and that this is very necessary will be grasped at once when it is stated that, under

Digitized by Google

the heading of porcelain alone, there are over five hundred pieces of different design. Adjacent to the stores is the brass and iron foundry, where the casting of the bases and covers of switches, the boxes for fuses, transformer cases, and the various parts of instruments and fittings is carried on. There is a pattern shop attached. Beside the castings made in connection with the finished work produced by the firm, a large amount of casting for outside manufacturers is also undertaken.

Before describing the machine shops, a few words with regard to the power supply in the works will be of interest. Originally the works had its own generating plant, but, as this had been added to at various dates, it consisted of a miscellaneous collection of belt-driven dynamos, and, in the year 1906, the whole of this plant was cleared away and a supply was taken from the North Metropolitan Electric Power Supply Co., who erected a transformer sub-station in what was then the dynamo-room. These particular shops form a striking example of the economy in space which can be effected by taking a supply from an outside source, as the caged-in sub-station covers a floor area of less than 400 square feet. The engine dynamo and battery rooms covered an area of close on 10,000 square feet, so that on changing over to a supply from outside, a space of some 9,500 square feet was available for manufacturing purposes. Only two of the boilers which were formerly used have been retained for heating purposes, so that the space originally occupied by the remaining boilers was also rendered available for other uses. Three-phase current for both lighting and power purposes is distributed

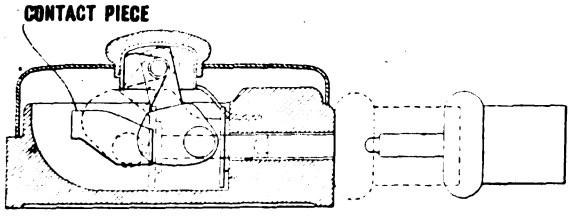

Fig. 7.—Section of Through Switch-plug.

throughout the whole works at 160 volts across the phases, and 50 cycles per sec. The insulated cables are run overhead from shop to shop, and are carried along in the shops on insulators just below the rafters. The three leads from each motor run up the walls in tubing, and are connected to the main cables above, after passing through the necessary switches and fuses, by means of ordinary soldered T joints, taped over. All the larger motors are provided with wound rotors and slip-rings, and a resistance is inserted at starting. The machine tools in use in the works have very variable loads, and the system of driving is that in which groups of machines are run from a line of shafting with fast and loose pulleys, driven by a motor of a comparatively large size.

In the turret shop, illustrated in Fig. 1, which has an area of over 10,000 square feet, there are about 150 machines, comprising turret lathes, screw-cutting lathes, drills, and various special tools, and these are divided up into eight groups, each driven by a motor of about 20 h.p. capacity. Among the more interesting machines in this shop are a set of twelve automatic pin and stud machines, which turn out small-threaded pins at the rate of six per minute. For cutting out grooves in 'bus-bars for fuse-boards, &c., a special but simple machine, comprising a row of milling cutters mounted on a long spindle, is used. Adjacent to the turret shop is the automatic tool shop, a view of which is given in Fig. 2. This shop is equipped with a large number of single-spindle and four-spindle automatic lathes for producing turned and screwed parts to any required pattern in large quantities. The two different methods of artificial lighting adopted in the shops are represented in this view, namely, the usual single lamps or lamp clusters suspended from above, and, where this was rendered impossible by the presence of the overhead shafting, the use of tubular standards fixed to the floor. The whole of the lighting of the shops is carried out by incandescent lamps. Fig. 3 shows the brass shop, where all the larger brass parts are turned and shaped, and Fig. 4 illustrates the switchboard end of this shop. Here, the finishing and assembling of heavy switchgear, fuses, circuit-breakers, &c., is carried on, and large switchboards are also fitted and erected in this shop. Some fine examples of modern switchboards are now passing through the works; these are for the new Orient liners.

It may here be mentioned that there is a special shop for boring and enamelling the slate panels of switchboards and the bases of circuit-breakers, &c. The panels are sanded smooth and bored before enamelling, and this ensures a higher insulation, as the whole surface of the slate is enamelled. The press shop, where the various thin parts of lamp-holders, tumbler switches, &c., are stamped out from sheet, is illustrated in Fig. 5. In this shop are a large number of interesting pressing and stamping machines. These consist chiefly of power presses, such as those illustrated in Fig. 5, and hand-presses, besides a number of lathes and special machines. The pieces are shaped and formed in successive steps, in some cases undergoing as many as eighteen different operations before leaving the shop. All the stampings used in switches, holders, small cut-outs, and other accessories are produced here. The flanges for lamp-holders are stamped out from a single piece, and consequently the liability to fracture at the joint, which exists when they are made in two pieces, is not present. Holders and caps are threaded and given all the final tooling in this shop before being dipped. Stamped work other than the parts of electrical fittings is carried out in this shop, as, for example, the manufacture of ornamental metal boxes and metal knobs. The latter consist of four pieces pressed together. All the special tools used in this work are also made here. After leaving the stamping shop, the various pieces are passed through to the dipping shop, where they are cleaned. They are then taken to the burnishing, polishing, or plating shops to be finished as required. The workers in the polishing shop are well protected from the ill effects of metal dust, as each mop is situated under a cowl connected with an exhaust fan. Small switches, holders, plugs, cut-outs, and other accessories are assembled by women in a room adjacent to the brass and switchboard shop; this is termed the holder shop, and is illustrated in Fig. 6.

One of the latest novelties which the firm has produced is a combined switch and plug socket, and the various parts of this fitting were to be seen going through the different shops. This switch socket, which, together with its plug, is illustrated in Fig. 7, has been designed to meet the need for a socket which shall become dead the moment the plug is removed, and shall remain dead until the plug is not only replaced, but is pushed right home. The plug is provided with different-sized pins, so that it is impossible to make contact in any way other than that for which the plug is wired. As can be seen from the figure, the construction of the switch socket is very simple, and the whole fitting is very neat in appearance. The dotted lines show the positions of switch and plug when the latter is pushed in. To remove the cover, the cap just above the switch contacts is unscrewed. This fitting is made in two sizes, for 5 and 10 amperes respectively, and with polished brass or oxidised silver covers.

In one of the larger shops, which is chiefly devoted to the assembling of "Ediswan" flame arc lamps (made under the Carbone patents), the small auto-

Digitized by Google

transformers and balancers, especially designed for use with low-voltage metal filament lamps, are constructed. Particulars of these transformers were given in ELECTRICAL ENGINEERING, Vol. III., page 766. The cores are built up of the best transformer iron, and are interleaved at the joints to reduce the no-load current to the lowest possible value.

Among the shops which, as yet, have not been mentioned is the carpenters' shop, where the teak and walnut bases for switches and cut-outs, and the boxes for fuse-boards, &c., are turned out. The large end-locking machine used in the manufacture of these latter is of interest; it consists of a pivoted frame holding a revolving cylinder, on which is fixed a number of cutting tools, and this is swung into contact with the edges of the pieces of wood to be end-locked. Special machinery is fitted in this shop for turning out circular switch-blocks, which are produced in large quantities. A staining and polishing shop is attached to the carpenters' shop.

The last shop visited was the instrument department, in which the various instruments sold by the company are manufactured and tested. The moving-iron type of instrument is made in various finishes and sizes for switchboard and portable use, and the portable sets especially are a prominent feature of this department. A speciality of the firm is a cheap, solidly-made instrument for motor circuits. This is of the moving-iron type with air-damped movement, and we are informed that it has proved very satisfactory in use. The moving-coil instruments have several special features, notably the casting in of the pole pieces, and the simple form of cradle used for the coil, which enables it to be easily removed for examination, only four screws being required to assemble the pole-pieces and coils complete. These instruments, when specially ordered, are made with mirror scale and knife-edge pointer, enabling readings to be more accurately observed. Many other types of instrument, into the details of which we cannot at present enter, are also manufactured.

It may be mentioned that the works employ over two thousand hands, of whom about 40 per cent. are men and boys. With regard to transport of raw material and goods, the Ponder's End station of the Great Eastern Railway is quite close to the works, and motor-vans keep up a constant service between the works and the City warehouses in Queen Street.

Blankenese-Ohlsdorf Railway.—The Allgemeine Elektricitäts Ges. is constructing 25 new motor-coaches for this single-phase railway, which runs through Hamburg. Each coach will have a seating capacity of 120, and a total weight of 65 tons. The cost is stated to be approximately £5.000 per coach. This further order shows that the traffic on the line, which at present is dealt with by sixty similar coaches, is steadily increasing.

Electric Pumping at New Zealand Crown Mines.—Owing to the inflow of water in the fifth level of the New Zealand Crown Mines Co., situated at Karankahake (N.Z.), in the Hauraki district, it was impossible to explore the reef below the place where a run of valuable stone was met with. The directors therefore, says the *Australian Mining Standard*, made inquiry as to the cost of installing an electric pumping plant, and the necessary machinery has now been purchased. Electrical energy will be generated by a 550-kw. three-phase alternator, and transmitted over bare cables to the mine, where motors will be erected in the main incline shaft for driving duplex pumps. The plant will be capable of pumping, in two stages, 1,135 gallons of water per minute from a depth of 1,000 ft. The following is a summary of the plant that will be installed at the power-station and at the mine: one Belliss & Morcom three-crank triple-expansion engine; one 550-kw. three-phase generator; one 25-kw. exciter, switchboards, and instruments; two Babcock & Wilcox boilers, each of 1,827 superficial feet of heating surface, and each fitted with superheaters of 154 superficial feet of heating surface; one surface condenser with air and circulating pumps; one feed-water heater and filter; one 720-h.p. turbine with governor; transmission lines, which consist of three bare 37/14 stranded conductors; two three-core insulated cables; two three-phase motors, each 250-h.p.; two duplex pumps, each capable of lifting 1,135 gallons of water per minute; one small transformer.

GREAT YARMOUTH TELEPHONE EXCHANGE

THE transfer of subscribers connected to the Great Yarmouth exchange of the National Telephone Company to the new central battery equipment was effected last Thursday at 2 p.m. The new equipment was manufactured and installed by the Western Electric Co., of North Woolwich, and is of what is known as the company's 10 C.B. type. The portion of the equipment already installed comprises four subscribers' or "A" positions, giving accommodation for 600 subscribers' lines, and one incoming junction or "B" position, but the ultimate capacity of a board of this design is 1,600 subscribers' lines. The arrangement of the circuits in the 10 C.B. pattern of board is similar to that of the standard No. 1 board used extensively by the National Telephone Co., but there is a difference in the resistance of the line relay which has a value of 1,000 ohms in the case of the No. 10 board, and 60 ohms in the case of the No. 1 board. The No. 10 boards are built in one-position sections, and the larger part of the apparatus used in connection with each section is mounted thereon.

Modified Daniel Cell.—As the result of experiments carried out at the University of Naples by L. Sandino, a modified form of the Daniel zinc-copper cell has been developed. This, according to the *Elektrotechnischer Anzeiger*, comprises two thin porous pots one within the other, leaving an annular space about 10 mm. wide, which is filled with an iron oxide paste. The whole is placed in a glass outer pot, with the usual zinc rod and copper plate, and sulphuric acid and copper sulphate solutions. The E.M.F. of the cell is from 1·05 to 1·10 volt, and experiments have shown that the E.M.F. is remarkably constant, as the intervening oxide mass prevents the carrying over of copper sulphate on to the zinc. The internal resistance is stated to be lower than that of the ordinary Daniel cell. A cell was connected up to a resistance of 13 ohms, and after 1,000 hours the terminal pressure had only dropped 1/100 volt. The consumption of zinc and copper sulphate is said to be considerably reduced.

The "Electron."—The February issue of this journal, the official organ of the Siemens' Stafford Institute, contains a portrait and a brief summary of the career of Mr. E. O. Kieffer, who has succeeded Mr. Lee Murray as Works Manager of the Stafford works. A most interesting and instructive Paper, read by Dr. W. H. Eccles before the Engineering Society, and dealing with the efficiency of the transmitting and receiving apparatus used in various systems of wireless telegraphy, is reported in full in this issue. Quantitative values for the energy now required for long distance work are given, and some figures relating to the efficiency of the aerial as a wave radiator are included. A Paper and a discussion on the apprenticeship system are also given. The method of lining up large motor-generator sets, and ensuring that the parts in any two sets are interchangeable, is the subject of an illustrated article in reply to a question in a previous issue. The articles on "Dowsing for Minerals and Water," and "Reminiscences of Life in Germany," are continued, but the editors have been obliged to postpone the publication of the remaining "Siemens" biographies until a future issue. Reports of the meetings of the various literary and athletic sections of the Institute are included as usual.

Non-Statutory Electric Supply in Scotland.—A deputation from Scottish municipalities owning electricity works waited upon the Parliamentary Secretary to the Board of Trade, Mr. H. J. Tennant, on Tuesday last week, in reference to the supply of electricity in Scotland without statutory powers. The full story of this controversy was related on page 159 of our issue of Feb. 18th, and is briefly that the North British Electric Power Syndicate, Ltd., proposes to supply electrical energy in a number of Scotch towns, the *modus operandi* being to run cables alongside the railways and thus be relieved from the necessity of seeking Parliamentary powers, their prospective customers being the power users whose premises abut on to the railways. The deputation suggested that the Board of Trade should promote a short Act of Parliament to prevent the supply of electrical energy except under statutory powers. Mr. Tennant, in reply, rather doubted the possibility of any harm being done to existing authorities by the proposed company, but promised to consider the matter. The very statutory obligations of those represented by the deputation were their protection, for a consumer taking a supply from such a non-statutory company would have no security of any sort. At the same time, he suggested the desirability of a test case as to whether a railway company was entitled to grant wayleaves for the laying of electric mains in the manner complained of.

PARAFFIN-OIL ENGINES FOR SMALL DYNAMOS, PUMPS, ETC.

RECOGNISING the increasing demand that exists for small self-contained engines for driving dynamos, pumps, &c., and using an easily obtained and inexpensive form of fuel, Messrs. W. H. Allen, Son & Co., of Bedford, have designed and placed on the market a new series of small paraffin-oil engines, some examples of which we were privileged to see running at their works on Thursday last. A drawing of a single-cylinder engine of the series, together with some details of its construction, is shown in the accompanying figure.

The engines are all vertical and enclosed, and are made with one, two, or three cylinders for running at speeds varying from 800 to 500 r.p.m., according to size and requirements. They are fully standardised up to 75 b.h.p., and can be made up to 100 b.h.p. A group of six engines were shown running, one of the 2½ b.h.p. size was shown running light to demonstrate the steady governing under these conditions, and the remainder were direct-coupled or belted to pumps or dynamos taking their full load. The largest set shown consisted of a two-cylinder 5 b.h.p. engine running at 800 r.p.m. and coupled directly to a 2¾ kw. continuous-current dynamo. Some of the engines were arranged with ordinary tanks and thermo-syphon cooling, and some were fitted with small rotary water-circulating pumps.

An important feature of the working of the engines is that only paraffin is used for starting up, so that no petrol or other fuel is required even in small quantities. The vaporiser is heated before starting by a blow-lamp burning paraffin, but the necessary temperature is maintained afterwards by the heat of the exhaust gases. The heating-up process is, however, of very brief duration, and full power is developed immediately the engine is started. When the engine is hot it can be stopped for short intervals and restarted without the use of the lamp.

There are no unusual features in the general design of the engine, which is of the usual single-acting four-cycle type. The bedplate and trunk are cast in one piece, to which the bearings are securely bolted, being spigoted into bored bearers to ensure perfect alignment. In small engines the cylinders and combustion chambers are cast in one piece, thus avoiding possible trouble with joints; in the larger sizes the combustion chambers are bolted to the cylinders. The pistons are made exceptionally long for vertical engines, to increase their life as well as that of the cylinders. The cranks are of nickel steel, and all other working parts are of Siemens-Martin steel, having a tensile strength of 28 to 32 tons per sq. in. and an elongation of 27 per cent. in two inches, and are case-hardened where any wear might possibly occur.

Elevation of Single-cylinder Paraffin Engine, with Sections showing Details of Vaporiser, Valve-gear, &c. (One-eighth Full Size).

The main bearings and crank-pin bearings are constructed with exceptionally large surfaces suitable for continuous running, and are lined with white metal. The flywheel is made of cast-iron, and is specially heavy to ensure an even turning movement. Forced lubrication is supplied by a pump worked by an eccentric inside the crank chamber. The oil passes from one main bearing through a hole bored in the crank to the big ends, and in the smaller engines through the hollow connecting-rod to the gudgeon-pin. In the larger engines a separate pipe attached to the connecting-rod is employed.

The inlet and exhaust valves are arranged in a pocket at the side of the combustion chamber, as shown in the drawing. The exhaust valve is directly below the inlet, and the inlet valve-box forms the cover for the exhaust valve. This arrangement was adopted to suit the vaporiser, which is bolted against the inlet and exhaust ports. The vaporiser is shown separately. The central tube forms the chimney for the lamp, and also

Digitized by Google

holds the lamp itself, and being in the centre of the vaporiser the heat is most efficiently applied just where it is required, the advantage of this being that little time is taken starting up. The fuel is drawn through the annular space between the lamp-tube and the inner wall of the vaporiser, where it is vaporised in the first instance by the heat of the lamp, and afterwards when the engine is at work by the exhaust gases passing round outside the annular vaporising space. The feed of the fuel to the vaporiser is controlled by a float chamber similar to that employed in petrol carburettors. The governor operates a drum-throttle, controlling the quantity of mixture, and an automatic valve supplies extra air required at full load. Arrangements are also made for allowing a small quantity of water to drip into the vaporiser, as in certain circumstances this is found to increase the power.

The Simms-Bosch pattern of low-tension magneto ignition is employed. The sparking-plug is placed at the side of the valve-pocket, and is worked by a very simple make-and-break gear, a feature of which is the method of removing the trip-rod when it is desired to examine the sparking-plug. This rod is held in place by a steel guide washer, which has a spigot fitting into a bracket below the plug, the guide washer being kept in position by the same spring that depresses the rod to trip the plug, the bracket being slotted to allow the rod to pass. All that is necessary to remove the rod is to depress the guide washer against the spring and pull the rod aside. The magneto is driven from the cam-shaft through spiral gear, except in the case of the 2½ b.h.p. engine, where it is oscillated by a crank. A single hand-lever puts the half-compression cams into action and retards the ignition for starting up.

The voltmeters connected to the dynamos that were being driven showed remarkable steadiness even in the case of the single-cylinder engines, and the completeness of the combustion was shown by the fact that a piece of white paper held in a by-pass of the exhaust was unmarked. One of their engines, of the 12 b.h.p. size, was used for the lighting of Messrs. Allen's stand at the Franco-British Exhibition, where it ran without a hitch for twelve hours a day throughout the season. The oil consumption for medium-sized engines is given as 0·67 lbs. per b.h.p. hour, but a better economy is claimed for the larger sizes. The engines are made complete at Messrs. Allen's works at Bedford, including the castings, and we must express our appreciation of the firm's courtesy on the occasion of our visit to the works.

L.C.C. Tramway Bye-laws.—An interesting point arose at the trial of the driver in the employ of the Metropolitan Electric Tramways, Ltd., at the Old Bailey on Friday in connection with the death of a boy who was killed by his car. The facts are as follows: The driver of the car in question, whilst between the Archway Tavern and Highgate Archway on January 21st (this line belongs to the London County Council, but is leased to the Company), found that his controller would not work, and proceeded to drive the car backwards towards Highgate Archway, the conductor being in the front and sounding the gong to warn the other traffic. The intention was to proceed until an inspector of the Company was met who would give instructions what to do. The car, however, overtook a brewer's dray, upon the ladder of which some boys were sitting, and before the conductor could give the signal for the driver to stop, a collision occurred, and one of the boys was killed, although the car was pulled up within two yards. The point in question was that, whereas under the London County Council rules for drivers of vehicles generally every driver must have a clear and unobstructed view of the roadway, in their tramway bye-laws a driver is permitted, in the circumstances of the present case, to drive the car backwards to the depôt, thus obviously breaking their own rule. This having been pointed out during the trial, it was stated on behalf of the London County Council Tramways Department that a revised draft of the regulations was being prepared for submission to the Commissioner of Police in order to avoid this anomaly. The driver in the present case was acquitted.

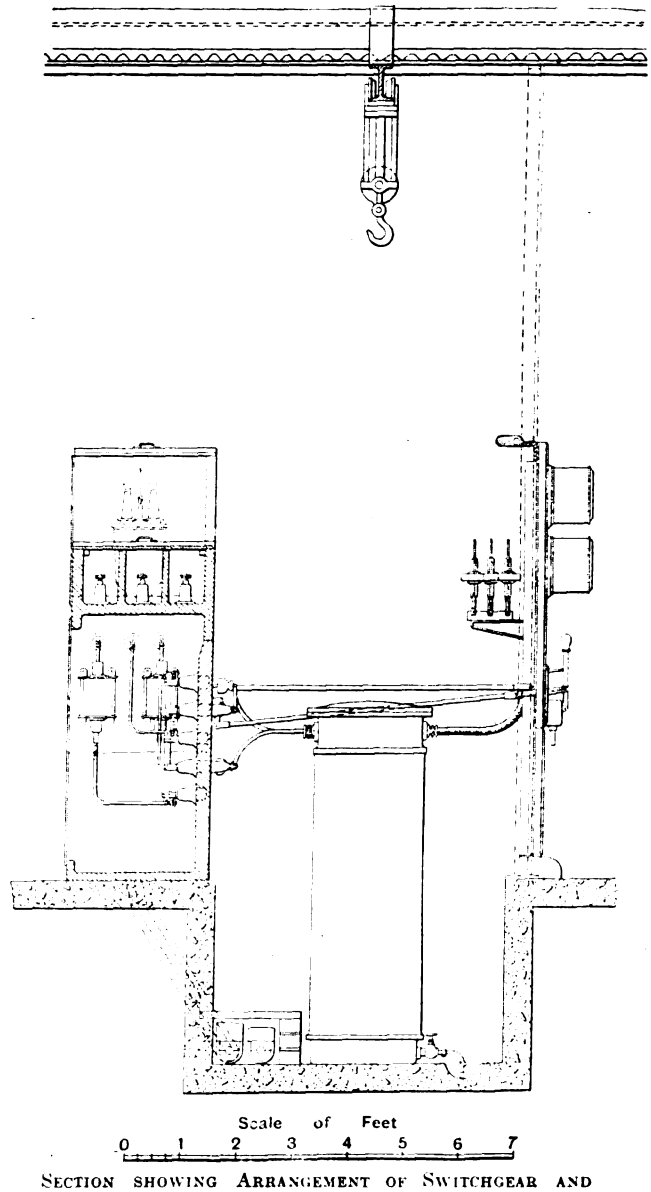
AUTOMATIC v. MANUAL TELEPHONE EXCHANGES

A RECENT issue of the *Journal Télégraphique* contains a Paper on automatic telephone exchanges read by Mr. Charles Barth de Wehrenalp (head of the technical service of Austrian telegraphs) at the International Congress of Telegraph and Telephone Engineers, held at Budapest last September. As a result of actual tests over a period of about five years, the author declared himself satisfied that, in spite of its incomplete development, the automatic exchange could compete seriously with the manual system, both as regards the rapid handling of traffic and economy.

On the first point he quoted the figure given at the St. Louis International Congress in 1904 by Mr. Gherardi, engineer-in-chief of the New York and New Jersey Company, of 3½ seconds as the average lapse of time between the subscriber removing his telephone and his request for a number, and 12½ seconds between this and sending of the ringing signal, a total of 16 seconds. The automatic system for 100,000 subscribers, the author stated, on the other hand, only takes 10 seconds for this operation. The average time taken between the subscriber hanging up and the line being cleared was given as 3 seconds by Mr. Gherardi, while the automatic system clears instantaneously. The saving in time, the author added, does not only benefit the subscribers, but enables the junction lines to be used for a greater number of calls per hour. At Vienna, the automatic system experimented upon is a 200-line Strowger set, the subscribers on which can also be connected to the 24,000 subscribers on the regular manual exchange system. Faults, both on the subscribers' instruments and in the exchange, it was said, were no more frequent than on the manual system. The equipment in question had been submitted to tests equivalent to nearly fifteen years of actual regular service, and it was found that repairs were easy to execute. A feature of the system tested in Vienna—technical details of which were not given, however—is that each subscriber's set has a key which enables him to obtain communication with an intermediate manual exchange in the event of the automatic system being out of order. A modification has also been made in the subscriber's instrument, which enables him to set up the number wanted first and then to turn the handle of the instrument—a simpler arrangement than the original Strowger system, in which a disc has to be turned round for each digit of the number. Another feature in the Vienna system is that the called subscriber can clear his line by hanging up his receiver.

Coming to the question of cost, the author gave tables to bear out his contention that the cost of working the exchange per subscriber (allowing 15 per cent. of the cost of the exchange as a capital charge and adding the cost of wages, but excluding all other charges) was slightly less for exchanges of from 1,000 to 10,000 lines, but that for larger systems the saving would be very great when using automatic exchanges. On a 10,000-line exchange the cost reckoned on the above basis was given as 400 pence per subscriber per year for an automatic exchange, 485 pence for an ordinary multiple exchange with junction lines, and 430 pence for a transfer system with separate positions for receiving the calls and completing the connections in each exchange. For a 20,000-line exchange he gave the corresponding figures as 425 for automatic working, 810 for ordinary multiple, and 550 for the transfer system, and for 100,000 lines, 455, 1057·5, and 664 respectively. The capital costs of the automatic exchange were in all cases much higher, being about double those of manual exchanges in the case of systems of 1,000 and 10,000 lines.

Telephony in Manitoba.—A report from Winnipeg states that the results of the first year's operation of the telephone system under public ownership have been most encouraging. The surplus amounts to over £50,000, and in view of this the tariff to subscribers is to be substantially reduced.



New Cable Route to New York.—The Newfoundland Government has agreed upon a contract with the Commercial Cable Company by which the latter will extend one of its cables from Ireland into Newfoundland, and thence direct to New York. One of the five Transatlantic cables belonging to the company will be cut at a point in the Atlantic 300 miles east of Newfoundland, and a new cable about 1,700 miles long will be connected to the European end; this will run to St. John's, Newfoundland, and from there direct to New York. The remaining portion of the original cable, which extended to Canso, Canada, and has a length of about 900 miles, will be picked up and resheathed for use elsewhere. An increase in the speed of working of over 35 per cent. is expected.

A TRANSFORMER SUB-STATION IN AN ENGINEERING WORKS

IN an article on the engineering shops of the Edison & Swan United Electric Light Co., Ltd., we mentioned the fact that the works were supplied with power from the mains of the North Metropolitan Electric Power Supply Co., who have erected a transformer sub-station in the works. In this connection, the following particulars of the sub-station and the cable connections, which we have obtained through the courtesy of Mr. E. T. Ruthven-Murray, Engineer-in-Chief of the North Metropolitan Electric Power Supply Co., are of interest. The works are supplied direct from what is known as the Ponder's End radial sub-station, by means of two 0·05 sq. in. three-core cables at a pressure of 10,000 volts. This "radial" sub-station is connected by 0·1 sq. in. cables to the Brimsdown generating station, and, indirectly, by way of the Edmonton sub-station, to the Willesden generating station, so that continuity of supply is ensured. A ring main, on which are situated two transformer sub-stations for supplying the surrounding district, is connected to the sub-station at Ponder's End, which is only a switching point.

The accompanying figure gives a very good idea of the arrangement of the sub-station in the "Ediswan" works. There are in all four transformers of the Brush Co.'s make, three connected in delta, and one spare. Special switching arrangements are provided, by means of which the spare transformer can be quickly paralleled with any one of the other transformers, and substituted for it, without putting the whole of the load on the remaining two. Each transformer has a rated capacity of 150 kw., and converts from the supply pressure of 10,000 volts to the works pressure of 165 volts for both lighting and power. The frequency of the supply is 50 cycles. Taken over working hours, the load on the sub-station averages about 300 kw. On the left of the figure are to be seen the oil break switches, supplied by the B.T.-H. Co., and on the right the operating board. This station is, however, under lock and key, and the whole of the switching operations are carried out on an adjacent board, which is the property of the works. An interesting feature of the sub-station is the provision for filling and emptying the transformer cases. They are all connected by a pipe along the bottom, as shown in the figure, and filling is done by gravity from an oil tank near by. To empty any case, the tap at the bottom is opened and the oil pumped back into the tank by means of a small semi-rotary hand pump. Another feature is the way in which the transformers are sunk in a pit to give sufficient head-room above for lifting one transformer over the others. The energy supplied is measured by means of three integrating wattmeters with the pressure coils connected in star, and thus, as the lighting load is distributed nearly equally among the three phases, the readings of any two meters serve as a rough check on the other one. There are also two recording wattmeters connected in the usual way, to indicate the variation of the load on the sub-station. This station supplies light and power to the lamp factory as well as to the engineering shops, and for the purpose of providing a direct-current supply for testing and other purposes two motor-generators are installed. One of these generates at 600 and the other at 300 volts.

SECTION SHOWING ARRANGEMENT OF SWITCHGEAR AND TRANSFORMERS IN SUB-STATION.

GERMAN EXPERIMENTS IN DIRECTIVE WIRELESS TELEGRAPHY

SOME interesting experiments have recently been carried out near Berlin by Dr. F. Kiebitz, of the German Imperial Telegraphs Experiment Station, who has communicated the results to the German Physical Society.

Starting with Bellini and Tosi's arrangement of two crossed aerial systems (see ELECTRICAL ENGINEERING, Vol. II., page 771, and pages 348 and 507), their well-known early results were confirmed, using aerials with sides 8 metres long, and a wave-length of 100 metres. Distances up to 3 kilometres were reached in this way with a primary energy of 25 watts, corresponding to a secondary output of about 9 to 10 watts. Greater interest, however, attaches to later trials with a single directive aerial arrangement, and with which comparison was made of the maximum range obtainable, using the same primary energy, first, with the ordinary vertical antenna system, and, second, with the directive method. The range was determined with a portable station which was moved progressively farther and farther away from the transmitting station. Thus, with 25 watts primary energy, signals from the vertical antenna transmitter could always be heard at 3,600 metres distance; beyond this they became weaker, and vanished at 3,900–4,000 metres, whilst at 4,100 metres the signals could in no case be heard. These results

Digitized by Google

were practically invariable, whatever the meteorological conditions.

The directive station was arranged with the two aerials of the nearly closed circuit placed in the direction east-west, having their tips 18 metres apart. The range of this station in the westerly direction was little more than 2,000 metres, but on increasing the distance apart of the tops of the aerials to 28 metres, the range in the easterly direction was about 4 kilometres, and in any case was certainly not less than the range of the

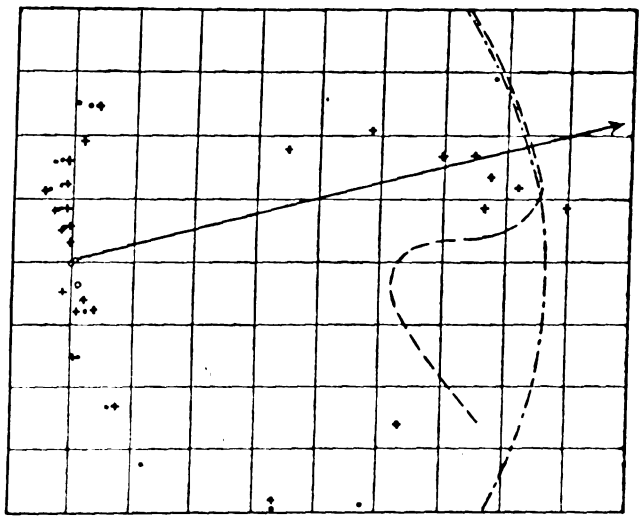

Diagram of Test Results.

ordinary vertical antenna transmitter. The vertical antenna station was erected 200 metres south of the directive equipment (in the direction of minimum radiation of the directive aerials) and was constantly in operation for the purpose of comparison. In order to obtain a curve of equal energy, the limiting distance at which signals from the directive transmitter could be heard was ascertained by moving the portable station about to the north, south, and east of the directive transmitter.

The results obtained in this way are plotted in the diagram, in which the positions of the masts are indicated by small circles; the long arrow gives the direction of the plane of the directive aerials, while the dotted curve is a circle, with radius 3·8 kilometres, round the simple vertical antenna station. The crosses indicate places where the directive signals were clearly heard, and the black dots mark places where no signals could be heard.

The limits of reception are seen to lie approximately on two circles which touch in the centre between the two masts, as has been demonstrated by Bellini and Tosi for shorter distances with the Duddell thermo-galvanometer.

Of the irregularities noticed, it is interesting to learn that on the north, where the ground was clear, a point of silence (no audible signals) was reached at 200 metres from the transmitter. On the south such a point first occurred at 350 metres distance, evidently on account of the disturbing reflections from the fringe of a village and from windmills. The dotted curve marks the limit beyond which no signals from the ordinary vertical antenna transmitter could be heard. This curve differs widely from a circle in one part due west of the transmitter, bending inwards in a remarkable manner. This so-to-say barren area, in which no signals could be received, differs from the other ground in that an extensive clay deposit exists there.

The experiments described, though containing nothing that is exactly novel, are exceedingly interesting, owing to the fact that they furnish an entirely independent confirmation of the results which have been published by Bellini and Tosi.

MAGNETIC PROPERTIES OF TUNGSTEN STEELS

THE Paper read last week before the Leeds Local Section of the Institution of Electrical Engineers by Mr. T. Swinden contained the results of an extensive research into the magnetic properties of a series of steels containing 3 per cent. of tungsten and varying quantities of carbon. Eight varieties were examined in various conditions of hardness and tempering. A Du Bois balance was used for the magnetic tests, and full hysteresis cycles for H=150 were taken as well as observations of remanence, and coercive force for H=25, 50, and 100. A long series of results are published in the Paper, and comparisons are made with data obtained by other workers. The maximum value of B was found to decrease regularly as the percentage of carbon increased within the range investigated, and reference to tests of comparable carbon steels shows that the value is practically unimpaired by the 3 per cent. of tungsten even in the quenched condition. The figures per remanent magnetism are considerably higher than per quenched carbon steels of similar carbon content. With regard to coercive force, the effectiveness of the tungsten depends largely on the treatment. In the annealed states the effect in inappreciable, but for the harder states, the coercive force is very considerably higher than for carbon steels. The value of the hysteresis losses is not of great practical importance with this class of steel, but it may be said that, as was the case with the other properties, the annealed bars give hysteresis losses, only slightly removed from those of carbon steels. The normalised bars are certainly somewhat higher, whilst the hardened bars give values very distinctly above the carbon steel values.

The question of permanence is dealt with at some length in view of the suitability of tungsten steel for permanent magnets. For annealed and normal bars, the ratio of remanent to maximum intensity was found to increase steadily in carbon content, but with the hardened steels a maximum value, 0·748, was found with about 0·55 per cent. carbon. The tempered bars gave a uniformly high value, increasing steadily up to 0·9 per cent. carbon, but the 1·07 per cent. carbon steel was somewhat lower.

The permanence was investigated in the following way:—Each bar was magnetised in a field of 150 units, the current then reduced to zero, and the bar removed from the balance. It was then subjected to shocks by dropping from a height of about 30 in. on to a block of wood, until a constant value of B was reached. When this value for the real permanence magnetism had been obtained, the specimen was demagnetised, and the remanent coercive force thus obtained.

The normalised steels showed a marked maximum, about 0·6 per cent. carbon, and the hardened steels presented a decisive maximum value, about 0·45 per cent. carbon, notwithstanding that the coercive force increased regularly. The tempered bars gave values much lower than hardened, and showed no maximum point within the range examined.

Experiments were also made on the tempering of hardened magnets, from which it appeared that a definite constant value of intensity exists for every magnet depending upon the maximum intensity by magnetisation and the coercive force. In considering the various methods which have been proposed for removing the sub-permanent remanence and arriving at this constant intensity the following remarks are made:—

Tempering is useful in relieving stresses, both physical and magnetic, caused by quenching. The idea is to demagnetise one-tenth of the remanent covers the sub-permanent remanence, but is probably a little more than strictly required in many cases. All forgings should be re-heated (or even recrystallised by "normalising") in order to relieve forging stresses—even though the piece may be re-heated again afterwards for hardening. This would probably render unnecessary much of the second tempering sometimes advised.

The correlation between magnetic and other properties was finally discussed. The importance of correct quenching temperature was mentioned, and some notes regarding the magnetic and physical hardness were included. The theories regarding the action of impurities on iron—chemical and physical—were considered, and the opinion was given that the effect of the added element on the constitution is of greater importance than its effect on the size of the crystals, although the latter may be of some importance.

Smoke Nuisance in London.—A conference of representatives from the Public Control Committee of the London County Council, and delegates from the twenty-eight Borough Councils has been fixed for to-morrow (March 12th), to consider amended proposals put forward by the Public Control Committee of the London County Council for the purpose of dealing more effectively with the smoke nuisance in London.

BUSINESS METHODS IN ELECTRICITY SUPPLY

IN a Paper read before the Civil and Mechanical Engineers' Society last Thursday, Mr. R. Borlase Matthews dealt with the commercial side of the management of electricity supply undertakings. The author emphasised the importance of effective advertising and organised canvassing in order to bring before the public the many advantages of the application of electricity to illuminating, heating, cooking, and power purposes, and pointed out the need of increasing the number of consumers to neutralise the decrease in output caused by the introduction of high-efficiency lamps. Besides giving a steady voltage and an uninterrupted supply, the station authorities should send out technically trained canvassers who should be representatives of the undertaking in the fullest sense of the word. These men should be capable of advising consumers and prospective consumers as to their special requirements, and should carry complete data as to the average bills of customers of all classes, and the cost of operating all kinds of apparatus. With regard to the maintenance and supervision of consumers' installations, the supply authority should see to this, and either charge a separate fee, or include the amount in the charge per unit consumed. A contract could be placed with a local wiring contractor to carry out such work in the whole area of supply. The author recommended a method of charging in which a high rate was charged for the units consumed in 90 hours' use at an assumed maximum demand per quarter, and a low rate, based on the station running costs, for the remaining units, the demand being estimated by taking the average of the known demands of similar installations. There should be only one circuit for lighting, power, heating, and cooking. In an alternative method, the high rate was determined by the amount of illumination required. With respect to the acknowledged ineconomy of electric heating, the author questioned whether strict economy was the supreme aim of the general public; the convenience, comfort, and cleanliness of electric heating should, in the majority of cases, overrule a slight difference in cost. Effective advertising literature was necessary to awaken interest in the recipients before they were called upon by canvassers. Such literature should be different for different classes of consumers, and should contain local and personal notes relating to electrical matters in the area of supply. As an example of the cost of such literature, the author stated that four undertakings operating in areas having a population of about 11,000 each, issued over 50,000 pamphlets of various kinds between them in one year, the total cost of editing, printing, and publishing being only £80, or 0·38d. per pamphlet. This gave an average of 15 pamphlets, and a cost of 5·7d. per prospective consumer per annum. These figures excluded the cost of postage or delivery.

PROGRESS OF WIRELESS TELEPHONY

A SHORT article by Dr. L. De Forest, in the *Electrical World*, states that during the cruise round the world of the American Fleet considerable improvements were made in the wireless telephone apparatus installed on the ships, chiefly in the direction of making the working more nearly automatic and less dependent upon skilled operators.

About the same time the improved apparatus was demonstrated before the French Government at the Eiffel Tower station. Using the small antenna similar to those on shipboard, voice communication was maintained from Paris to Melun, 60 km. (36 miles), and later at Marseilles, 130 km. (80 miles). During two nights, when the high antenna on the Eiffel Tower was in use, it was reported by the French Government wireless operator at the Mediterranean station near Marseilles, that gramophone music was heard over that distance, approximately 550 miles. Following these demonstrations in Paris, the French naval officers, especially Lieutenants Colin and Mercedier, continued experimenting with apparatus which they built following the De Forest designs, and have since reported very satisfactory results from Eiffel Tower to Dieppe, 150 km. (93 miles). The Italian Government purchased four sets of radio-telephone apparatus for marine work, which were installed by Dr. De Forest at Spezia last May.

The apparatus has been still further improved during the last summer, and in September, at the request of the British Admiralty, an official demonstration was made between H.M.S. *Furious* and *Vernon* at Portsmouth. During these tests perfectly clear and accurate voice communication was maintained up to a distance of 60 English miles, although this was by no means the limit attainable with these instruments on shipboard. As a test of accuracy during these tests, long lists of numerals were read into the transmitter on board the *Furious*, and written down at the receiving station on the *Vernon*. A comparison of these figures, *e.g.*, at the distance of 44 miles, shows an accuracy of 98 per cent. Further development and refinement has progressed since the Admiralty installation. The apparatus is being continually simplified, and its range increased so that Dr. De Forest declares that the radio-telephone is to-day applicable to a large number of vessels which cannot afford to carry a Morse operator, and which will be content with 100-mile communication.

Significant of large development in the near future is the fact that a contract has been made with the Metropolitan Life Insurance Co. for the use of its new tower (680 ft. high) as a wireless telephone and telegraph station. This will give the tallest antenna of the world, except that at Eiffel Tower, and it is reasonable to expect some long distance records from this station during the present year.

GAS ENGINE AND EXHAUST STEAM DRIVEN ELECTRICAL PLANT IN A SOUTH WALES COLLIERY

A PAPER was read last month before the Lancashire Branch of the National Association of Colliery Managers on "Gas and Electric Plants at Collieries," by Mr. Holt, formerly Electrical Engineer to the Powell Duffryn Colliery, South Wales, which is reported in the *Iron and Coal Trades Review*. After describing some of the features of the Bargoed Colliery, including the gas-driven ventilating plant, &c., the author passed on to the details of the coke ovens gas purifiers, acid and sulphate plants, and then proceeded to describe the gas engine equipment of the power house, which supplies electrical energy for power and lighting purposes to the pits.

The power house equipment at Bargoed consists of two double-acting four-cycle Nurnberg gas engines, one of 1,200 b.h.p. and the other of 2,400 b.h.p.—the latter being the largest gas engine in this country—constructed by the Maschinenfabrik Augsburg Nürnberg. These are coupled to 825-kw. and 1,600-kw. A.E.G. alternators, for supplying three-phase current at 3,300 volts pressure and 50 cycles. Each set has its own direct-coupled exciter mounted on an extension of the crankshaft, and is provided with electrically-driven barring gear.

Principal interest centres on the 2,400-b.h.p. engine, which is practically a double 1,200-b.h.p.; that is to say, instead of one double-acting tandem engine of 1,200 h.p., with the alternator on one side, as in the smaller set, it consists of two such engines, each of 1,200 b.h.p., arranged on either side of the alternator. All the cylinders of both sets are 34·25 in. diameter with a stroke of 43·3 in., and the speed of each set is 100 r.p.m. Each end of each cylinder has a gas admission, a mixing and an exhaust valve, these being operated by rolling levers, which in turn are worked by eccentrics mounted on a horizontal lay shaft at the side of the engine and geared to the crankshaft. The gas valve is controlled by a trip gear, which, under the influence of the governor (also worked from the lay shaft), varies the amount of gas in the gas and air mixture to suit the load. Duplicate electrical ignition is provided at each end of each cylinder, worked from two small batteries at about 70 volts pressure. The cylinders, cylinder covers, pistons, piston rods, and the exhaust valves, with their spindles and casings, are all water-cooled. No difficulty is experienced in the parallel running of either gas engine with any of the other generators, whether it be the other gas-driven set, or the slow steam set or the turbines. The cooling water for these engines is stored in a reservoir situated about 80 ft. above the level of the engine-house floor; after passing through the various parts of the engine it is collected in a tank and returned by electrically-driven centrifugal pumps, through Harrison cooling nozzles, to the reservoir. Thermometers are fitted in the pipes where the water leaves the engine, so that the drivers may see at once any unusual rise in temperature. The engines are started by means of compressed air, which is stored in tanks at a pressure of 300 lb. per square inch. The mixture is only compressed to between 90 and 105 lb. per square inch before ignition takes place, the large amount of hydrogen in the gas tending to cause pre-ignition at any higher pressure. In spite of this the thermal efficiency of the plant is not unsatisfactory. Two tests which were taken of the larger engine at 0·92 and 0·935 of full load showed that the engine was using 12,300 and 13,300 B.Th.U. respectively. The engine room staff consists of one switchboard attendant, and a driver and cleaner for each engine working.

Under ordinary circumstances the large engine is started at 8 a.m. on Sunday morning and runs through to 2 p.m. on the following Saturday, when it is stopped for cleaning, &c. One end of a cylinder is opened each week-end, so that each end gets thoroughly cleaned from gas and oil remains once in eight weeks. Any accumulation of carbonised oil on the piston or cylinder cover tends to cause pre-ignition. These pre-

Digitized by Google

ignitions, whilst being very noisy and somewhat alarming to a stranger, appear to do no harm to the engine. The sparking plugs are all overhauled each week-end. The hot gases immediately they leave the cylinder meet a stream of cold water, which is supplied to each end of each cylinder by a ⅜-in. bore pipe.

The exhaust steam utilisation plant, which is worked in conjunction with the gas engines, consists of a Rateau low-pressure turbine made by Messrs. Fraser & Chalmers, coupled to a 500 kw. three-phase generator made by Messrs. Dick, Kerr & Company, by means of a Rateau flexible coupling. The steam used is the exhaust of two winding engines, one having a pair of cylinders each 36 in. diameter by 72 in. stroke, and the other having a pair of cylinders each 42 in. diameter by 72 in. stroke, and both using saturated steam at 80 lb. per square inch pressure. The exhaust steam is conveyed by uncovered wrought-iron pipes into an accumulator and regenerator, which consists of a steel shell about 9 ft. diameter by 30 ft. 6 in. long, divided longitudinally by a curved horizontal diaphragm into two chambers, each chamber containing four perforated flues. The lower chamber communicates with the top of the upper chamber by vapour pipes, for carrying off the steam regenerated in the lower chamber to the upper steam space. This vessel is fitted with steam dome, water regulating apparatus, pressure gauge, and automatic blow-off valve. The function of the accumulator is to receive an intermittent supply of steam from the winding engines and to give a steady supply of steam to the turbine. This it can do provided the winding engine stops do not exceed forty seconds; should this time be exceeded, an automatic reducing valve admits live steam to the turbine at a reduced pressure. The guaranteed steam consumption in these circumstances is 40 lb. per kw.-hour.

AN ELECTROMAGNETIC EMERGENCY BRAKE FOR SHAFTING

IT is often desirable for security against accidents to provide some means for quickly bringing shafting to rest in cases of emergency. When the shafting is electrically driven this can sometimes be done by short-circuiting the motor, but this method cannot always be relied upon, as the belt is apt to fly off on account of the sudden braking action of the motor. The Felten-Guilleaume-Lahmeyerwerke Co. have therefore designed an electromagnetic emergency brake, acting directly on the shafting, and this is already in extensive use.

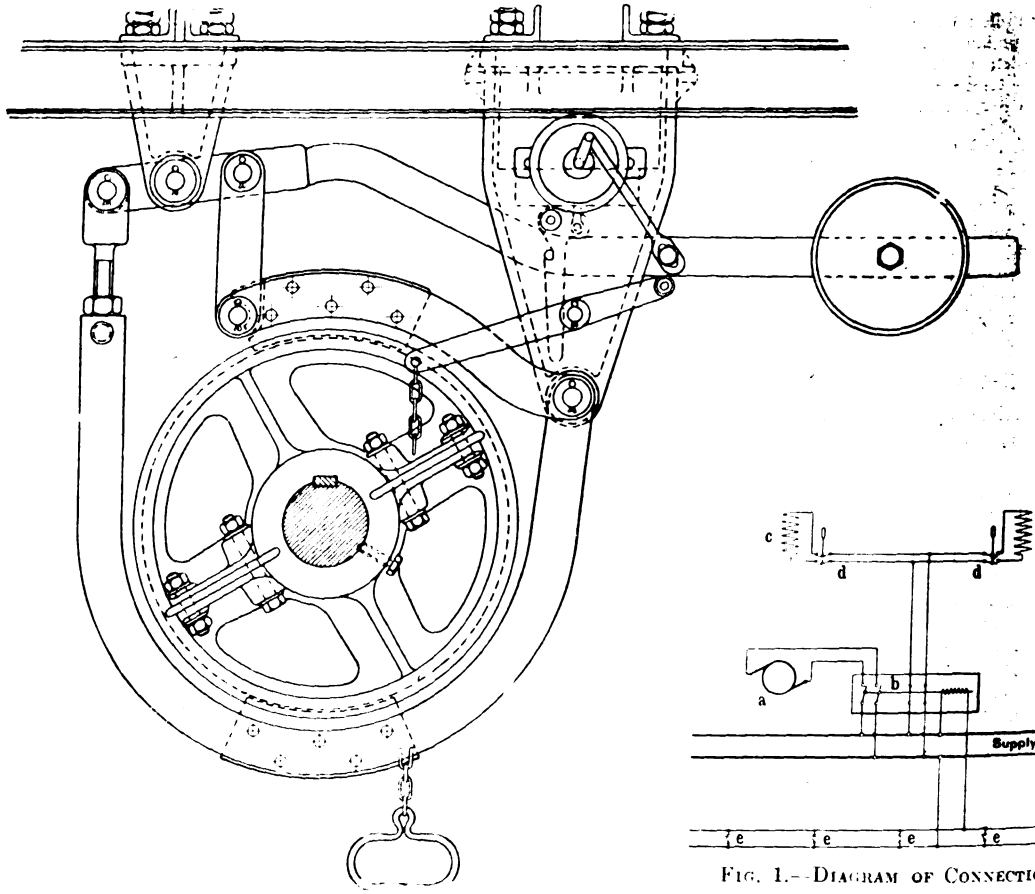

FIG. 2.—ELEVATION OF EMERGENCY SHAFTING BRAKE.

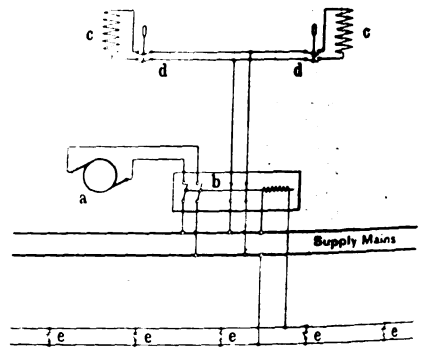

FIG. 1.—DIAGRAM OF CONNECTIONS.

A diagram of connections of the continuous-current form is given in Fig. 1. The coil of a remote-control switch *b*, the circuit of which is provided with one or more push-buttons in parallel, as the case may be, is connected to the supply mains independent of the motor *a*, which serves to drive the shafting. The remote-control switch comprises two double-pole switches, one in the armature circuit of the motor and the other in the circuit of one or more brake-lifting magnets *c*. These switches are interlocked in such a manner that when one is open the other is closed, so that either the motor or the brake-lifting magnet is put into circuit. When the motor is running and the brake-lifting magnet out of circuit, the coil of the remote-control switch is not energised. If, however, any one of the push-buttons be pressed, the coil becomes energised and the switch automatically changes over into the other position, in which the motor is cut out and the brake-lifting magnets put into circuit. Further, the opening of a catch results in the now energised brake-lifting magnet releasing the brake weight. In order that the coil of the brake-lifting magnet, which has only been designed to carry current intermittently, does not remain under current constantly, a double-pole switch *d* is provided which is actuated by the falling brake weight. The brake-lifting magnet therefore only remains in circuit momentarily. The actual construction of one form of the brake gear is shown in Fig. 2.

When the shafting is to be restarted, the remote-control switch is first of all brought into the starting position, and the brake is then freed by means of a chain and lever arrangement so as to allow the catch of the brake-lifting magnet to engage again, by which means the switch *d* is also brought back into its starting position. It is impossible to release the brake without having previously put the remote-control switch into circuit, as in that case the brake-lifting magnets would come into action and make the arresting catch inoperative. The remote-control

Digitized by Google

switch can, however, only be put into circuit again after the motor starter has been brought back into its "off" position, which can, of course, be done by a no-voltage release.

The brake illustrated in Fig. 2 is a simple counter-poise brake, possessing two brake blocks, which, when the weight drops, acts upon a special brake pulley keyed on to the shaft by means of suitably shaped levers, which are drawn up simultaneously. The brake weight is, when free, held by a catch, which may be released by the brake-lifting magnets. The connection of the weight with the switch which cuts the brake-lifting magnet out of circuit, may also be clearly seen in Fig. 2. A special lever, also shown in Fig. 2, which may easily be operated from below by means of a chain, serves to release the brake and operate the switch. With regard to the brake-lifting

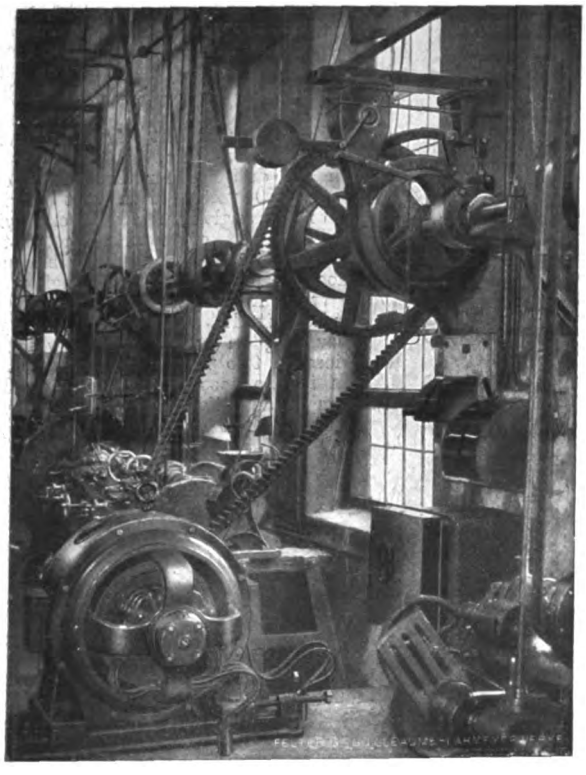

FIG. 3.—VIEW SHOWING ARRANGEMENT OF SHAFT BRAKE AND DRIVING MOTOR.

magnet, a small type can be used, as only the catch release, which is totally independent of the low brake output necessary at any time, is to be actuated.

Fig. 3 is from a photograph of a brake of this description, which has been installed in the repair shops of the Prussian State Railway at Lauban, in connection with a motor driving through a Renold's chain. In this illustration the details of the arrangement, as well as the driving motor, together with the switchgear, are clearly shown and the method of fitting the brake is also shown.

The arrangement described is also suitable for alternating as well as direct current. The only difference for operation with three-phase current is that, in addition to the motor, three brake-lifting magnets are in the circuit, one in each phase, whilst the coils of the remote switch, together with the push-buttons, are connected to one phase. In the case of alternating current, therefore, no alteration takes place in the method of operation.

Medical Inspection of Tramcar Drivers.—The Municipal Tramways Association is recommending to the various Municipal Tramway Committees which are members, that all tramcar drivers should be required to undergo a medical examination on being appointed, and periodical examinations subsequently.

Colliery Fatality.—An inquiry into the circumstances attending the death of T. Griffiths, of Acrefair, East Denbighshire, was held last week. The deceased was employed in the pump-house of the Wynnstay Colliery, and was killed by coming in contact with an insulated cable which was slightly damaged. The pressure was 500 volts. Mr. Nelson, the inspector of mines, attached blame to no one, but thought the pump-house too small to be safe. A verdict of accidental death was returned.

WATER-POWER PLANT AT MARTIGNY, SWITZERLAND

THE extensive water-power plant which has recently been erected at Martigny, in the Rhone Valley, is of interest, as supplying current for electrolytic purposes both at low pressure for use in an adjoining works, and also at high pressure over a transmission line for general purposes.

The locality in which this power-house has been established is becoming an important centre for electrical enterprise, as, in addition to electrolytic works, the town is the starting point of the newly-opened Martigny-Chatelard electric mountain railroad, which enters the valley in the region of Mont Blanc, making connection with the Chamonix-Fayet line, and thus enabling tourists to make a continuous trip by railway through the region of Chamonix, which was hitherto impossible. At the same time the projected Martigny-Aoste electric line will start from here.

The new generating station is owned by the Société d'Electro-chimie, a large company possessing several works both in France and Switzerland. The description here given is founded on information accorded through the courtesy of M. de Blonay, chief engineer to the Martigny station.

The power of the river Dranse is utilised, as the plant lies practically at the mouth of the valley of that stream where it joins the Rhone Valley. The hydraulic work, including a dam of some size, is situated above the turbine plant at the locality of Sembrancher. From the outlet, which is constructed at one side of the dam, the water is taken off through a tunnel of about 50 sq. ft. cross section, cut in the rocky side of the gorge, with a gradient which varies between 1·5 and 2·5 per cent. Along the course of the tunnel has been erected a settling basin, this being necessary in the present case, owing to the turbid nature of the water. This is provided with a set of side-gates for emptying the sand and gravel on the side next the river. The water then passes to a tunnel of 1½ miles in length, which is worked under pressure. In order to connect it with the end of the first section, there is used a short length of pressure tunnel, this joining with the end of the first tunnel and descending at a slope of about 45°. The length of this short portion is about 330 ft. The remainder of the pressure tunnel proceeds at an almost level grade, and reaches a point in the mountain-side overlooking the turbine house. From this point proceeds a single pipe line capable of receiving the 14 wheels of different sizes in the station. This pipe line is placed in a tunnel cut in the rock, and comes down at an angle of 42° on the mountain-side. The tunnel is about 12 ft. in width and 9 ft. in height.

The amount of power which can be obtained from the present plant reaches 18,000 h.p. at the maximum flow. From the turbine house to the dam the distance is about 3·2 miles. The penstock proceeds under the turine house, lying along the central axis of the latter. Branched from it are the connections, which run upward to the various wheels of the plant. From the wheels the discharge water is taken by a set of piping to a common off-take canal, which empties into the Dranse river at a point near the station. The penstock, which is about 5 ft. in diameter, was built by Piedbœuf Co., of Düsseldorf. It is about 1,300 ft. in length.

In the station the main direct-current electrolytic machines for supplying the electrolytic works in the adjoining buildings are on one side and the large alternators are on the opposite side of the dynamo-room. The alternators generate current at high tension in order to transmit it over a power line, also partly for electrolytic purposes.

As it was necessary in the electric furnace to use two different standard voltages according as the current is intended for carbide production or for other purposes, a part of the direct-current generators are designed to give a normal pressure of 300 volts, while the remainder of the machines are intended for a 150-volt supply. The five generators are furnished by the well-known Geneva firm, the Compagnie de l'Industrie Electrique.

The first group of three generators are designed each for an output of 2,500 amperes at 300 volts, and they are driven by the turbines at a speed of 300 r.p.m. The turbines were built by the Vevey Machine Co. Owing to the fact that their use for electric furnace work does not require the voltage to be kept at a constant value, it is not found necessary to provide speed governors for the present type of turbines. The succeeding group of two machines has turbine units of the same capacity, 750 kw., but the current is heavier in this case, being 5,000 amperes at 150 volts. These sets also run at 300 r.p.m.

Two alternators are at present installed on the opposite side of the station, but space is left for erecting several other groups. A third group is, in fact, already being put in. These three machines were made by the Oerlikon Co., and they furnish three-phase current at 10,000 volts for the direct supply of the

Digitized by Google

transmission line without transformers. The output of each alternator is 1,500 kw., and they are direct coupled to horizontal shaft turbines at 2,500 h.p., running at 500 r.p.m These wheels are fitted with governors. At the side of each machine is mounted a large frame, which contains the rheostat coils, and it is faced with a marble panel having mounted upon it the necessary instruments. Below the panel are the hand-wheels of the rheostats.

On the same side of the plant are the exciters, two in number at present, each of which consists of a small multipolar generator driven by a separate turbine. The remainder of the installation comprises two direct-current generator and turbine groups of a capacity of 300 h.p. each and operating at 5,000 volts, and running at 750 r.p.m. A supply is thus obtained for the circuits of the town of Martigny, and the voltage is lowered to 100 volts for the lighting circuits by means of transformers at various points in the town. There is also a small motor-generator, which serves for the lighting of the station and the electrolytic works.

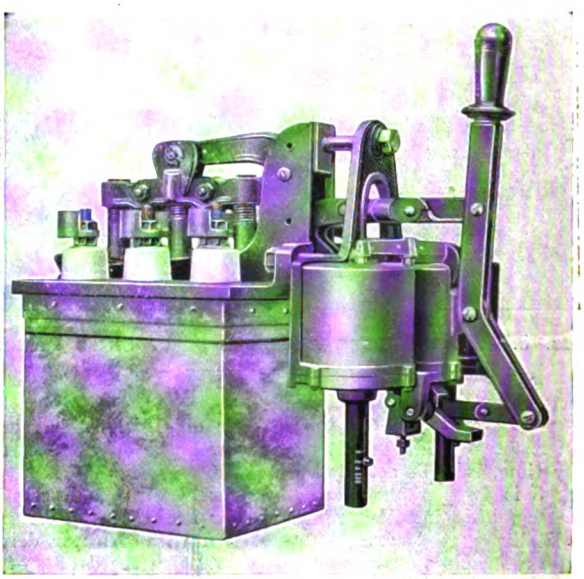
P. & O. Batti-Waller's Society.—The fourth annual dinner of this Society was held last Saturday at the Holborn Restaurant, when the President, Mr. C. L. Lichtenberg, and Mrs. Lichtenberg received some 60 members. Mr. E. L. Pinching proposed the toast of the P. & O. Steam Navigation Co., and Captain Parfitt, in his reply, spoke of the increasing importance of electrical engineering on board ship. During the proceedings, which included an excellent musical programme, a presentation of a handsome cigarette box was made to Mr. J. F. Avila, who has been Hon. Secretary of the Society since its foundation.

Electric Railway in the Caucasus.—A scheme has been prepared for an electric railway from Tiflis to Vladikaukas, a distance of about 130 miles. The railway will cross the Caucasus range through the Kvinamski Pass. A daily service of 20 goods trains, weighing some 180 tons each, in each direction, has been proposed, and the passenger service will be dealt with by eight motor coach trains per diem, the journey occupying about six hours. To supply the necessary energy, two water-power stations, with a total capacity of 18,000 h.p., will be constructed; these will also supply energy for lighting in the districts traversed by the railway.

Strike of Paris Hotel Electricians.—In view of the inconvenience occasioned by the failure of supply due to the strike of the supply-station stokers some time ago, several hotels and business houses in Paris have installed private generating plant. The men in charge have, however, been induced to join the Electricians' Trade Union, and a week or two ago the Hotel Continental was in darkness for a short period one evening in consequence of a demand for higher wages on the part of the electricians having been refused. According to the daily Press, the plant was only put in operation after the manager had agreed to raise the wages of the men and not punish them for their strike. Mon. Pataud, the secretary of the Union, is stated to have said that this is only the beginning of a general campaign for higher wages.

Electric Power in Canada.—In connection with the Ontario Government's scheme to provide the leading municipalities of Western Ontario with electric power, a contract has been entered into for the construction of a transmission line two hundred and fifty-two miles in length, the greater part of which is to be completed by the end of this year. Within the last two months, thirty-five municipalities have voted in favour of procuring power from the Hydro-Electric Commission. A dispute has arisen between the City of Toronto and the Toronto Electric Light Company, as the city wishes to have the monopoly of electric supply in the new suburban areas, and claims that the company can only supply within the boundaries of the city as it existed when the company was formed. The company deny this, and have already erected overhead lines in some of the outlying districts.

A New Conduit Wiring System.—We are informed that a new system of conduit wiring, which can be used either for surface or concealed work, designed by Mr. A. E. Woodhouse, is about to be placed on the market by the International Electric Co., of 55 Redcross Street. The actual conduit or casing is in the form of a flattened, stamped steel trough, over which is sprung a steel cover. The material is made in lengths of about 3 ft., and the cover of a length can be removed for inspection at any time. The lengths are coupled by being sprung into short pieces of slightly larger section, provided with countersunk holes for attachment to the wall. The joints of the cover are similarly protected by a short piece sprung over them. The appearance of this flattened conduit is much superior to wooden casing, and the system would appear to have advantages for temporary work, as it can be very quickly put up and removed. The steel is treated by a special patented process, which is claimed to render it absolutely non-rusting, so that electrical continuity is ensured.



CATALOGUES AND PAMPHLETS RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

WEIGHING MACHINES.—We have received a copy of a very complete catalogue of scales and weighing machines from Alfred Wiseman, of Glover Street, Birmingham, including every class of weighing apparatus from the smallest laboratory balances to large platform weighbridges.

THE WORKING MEN'S COLLEGE, MELBOURNE.—The prospectus of this college for the present year contains full information of the courses of instruction which are held there. These include both day and evening classes in the various branches of technical science and art, and also in commercial subjects. Illustrations of the class rooms and workshops, which appear to be admirably equipped, are given, and a perusal of the prospectus leaves the impression that the instruction given is of a thoroughly practical and up-to-date nature. The total cost of the buildings and equipment of the Institution to date has been about £70,000.

MINING SWITCHGEAR.—A pamphlet from Messrs. Reyrolle & Co., Ltd., of Hebburn-on-Tyne, relates to their mining switch panels, which are designed for three-phase distribution up to pressures of 6,000 volts. Each unit consists of a slate panel attached to an angle-iron framework with expanded metal covering. Dust-tight cases with sheet steel covering are also supplied. The live parts are accessible only by opening a padlocked door. An ammeter, a single-phase potential transformer, and two pilot lamps are provided on each panel besides the switch itself. A view of the type of triple-pole switch for mounting on motor panels, which is supplied with overload devices on two phases and a no-voltage release attachment, is given in the accompanying figure. The tripping gear and the means of adjusting the overload device are clearly visible. For pressures not exceeding 650 volts, a

Oil-break Switch, with Overload and No-voltage Release Attachments.

switch and panel of similar design but somewhat heavier construction is supplied.

Messrs. A. Reyrolle & Co. have found that the demand for no-voltage devices for alternating-current motors in the past has been very small, but that since the publication of the proposed Home Office regulations the demand has rapidly increased. In the three-pole oil-break switch illustrated, there are three coils enclosed in a cast-iron box. The two outside coils are connected to series transformers to operate the automatic overload trip. The middle coil is a shunt coil connected across two phases, and arranged so that immediately the supply is cut off, an armature is released, and a hammer weight knocks away the toggle which is holding the switch in position. The firm has also standardised a design with one overload coil only, but the method of operating the no-voltage release is the same in all cases.

WIRES AND CABLES.—A new list of cables and wires is to hand from Simplex Conduits, Ltd. The Company now supply the cables in accordance with the standards of the Cable Makers' Association, with the official label attached. They also supply "non-association" cables as heretofore. The list also contains particulars of a number of wires and cables for special purposes, and deals with dry cells, Leclanche cells, jointing materials, &c.

STREET LIGHTING IN MARYLEBONE

IN our issue of December 3rd last, we gave full details of the proposed scheme of street electric lighting sanctioned by the Marylebone Borough Council, which involved the substitution of 1,964 incandescent gas street lamps with metal filament electric lamps. An application has since been made to the London County Council for sanction to borrow the necessary amount for the change over, viz., £8,000, and upon this application the Finance Committee of the London County Council has now reported at some length. The above loan is made up as follows:—(1) Connecting lamp-posts to street cables, £4,168; (2) lanterns and fittings (conversion work), £3,832, and upon receiving the application for the loan, the Finance Committee asked for information upon the following points:—(1) As to the history of the lighting of the streets proposed to be dealt with, and how the expenditure of £11,000 recently incurred had been met; (2) as to the estimated financial result of the proposed alterations upon (*a*) the electricity undertaking, and (*b*) the general rates, and (3) as to the cost of gas compared with the cost of electricity, especially in regard to side streets, and whether the Borough Council had obtained any information from other local authorities on this subject, or, if not, on what grounds it concluded that electricity was cheaper.

In reply to these queries, the St. Marylebone Borough Council states that in 1903-4 the public lighting was improved by converting 3,500 lamps from flat-flame burners to incandescent burners at a cost of £11,187, the expenditure being borne out of the current rates at the time. With regard to the present scheme, the benefit to the electrical undertaking would be £2,507 a year, viz.—charge for supply of electric energy £3,950, *less* cost of same £1,443. As regards the cost of the present gas lighting, the Gas Light & Coke Company offered (provided that a contract for the whole of the gas lighting were entered into with them) to supply light to the 3,508 gas lamps at present in use in the borough at a total cost of £14,120. The cost for the 1,964 lamps at this rate works out to £8,301. This offer was, however, made by the company on December 9th, 1903, and at that time the Borough Council's estimate of the annual cost of electric lighting was £8,650. Since that date the Borough Council has decided that it can allow itself (as a large consumer) a discount of 25 per cent. for prompt payment, which reduces the £8,650 to £7,350, which, compared with the present cost (£8,818) of gas lighting, shows that the saving to the Borough Council would be £1,468 a year. The Borough Council further states that careful inquiries were made of some of the largest municipalities in the country, and it was found that there had been no experience elsewhere of the new electric lamp.

Since then, however, the company has offered to supply gas and maintain the gas lamps at an inclusive charge, which works out to £8,301 a year for the 1,964 lamps, the Borough Council's electric supply committee's proposal to charge £7,350 for them as altered shows a yearly saving to the rate fund of £951; but the Finance Committee are advised that the company's offer provides for 50 per cent. better illumination than that of the committee, a point which does not appear to have been fully considered. For equal illumination the offer of the Borough Council's electric supply committee (on the basis of figures put forward) would have to be increased to about £9,000.

As regards the estimated financial result from the point of view of the electricity undertaking, the borough electric supply committee expect to be able to keep the works costs for this street-lighting energy down to £3 a kilowatt of maximum demand, plus 0·35d. a unit, which would make a total of 0·52d. a unit, whereas the average cost for the year ended March 31st, 1908, was 1·38d. on the total output of the works. It is further noticeable that the revenue proposed is only 1·42d. a unit, or very little over the average cost. After very careful consideration, therefore, the Finance Committee are of opinion that the Borough Council has not made out a case for the expenditure proposed.

The Committee think that the present lighting of the streets proposed to be dealt with is quite satisfactory, and would not be improved by the present scheme, and the Borough Council is not warranted, in the present financial condition of its undertaking, in incurring the further capital expenditure now proposed. There might perhaps be some justification for the present proposal if the Borough Council were able to show without doubt that the expenditure would result in increased profits, either direct or induced, to the undertaking without involving any additional charge on the general rates for street lighting, but the Committee advised that the estimated results shown by the figures submitted by the Borough Council are problematical.

Furthermore, the proposal, if carried out, will have the effect of destroying a large part of the asset which the Borough Council obtained, at a cost of £11,187, when it provided incandescent burners in some of the lamps now proposed to be adapted for electricity, without obtaining any tangible benefit from the point of view of the lighting of the streets. Moreover, there is no demand whatever on the part of the public for any alteration or improvement in the lighting of the streets in question, and, furthermore, the proposal is one which has not by any means the unanimous approval of the Borough Council.

The Committee, therefore, recommend that the Council should decline to sanction the loan.

At the meeting of the County Council on Tuesday this recommendation was adopted.

Public Lighting in France.—There are at present 2,912 towns and districts in France provided with electric street lighting—namely, about three times as many as eight years ago. Those with gas lighting number 1,250, as against 1,033 in the year 1900. Acetylene lighting is employed in 130 towns. It is interesting to note that 63 per cent. of the supply stations are water-power stations, 29 per cent. are steam, and 9·3 per cent. are combined water-power and steam stations. The gas-driven stations number 4·4 per cent., and the oil-engine stations 1 per cent. of the whole.

Proposed Underground Railway System for Sydney.—A commmission has been appointed by the civic authorities to decide whether the much-needed connection between the city of Sydney and the north side of the harbour shall be by bridge or by tunnel, and in giving evidence before the commission, the Chief Engineer for Railway Construction described a scheme which had been prepared on the assumption that a tunnel will be constructed under the harbour between Fort Macquarie and Milson's Point. The scheme comprises an inner circle underground railway with five or six stations, a tunnel line under the harbour, and an extension into the eastern suburbs where the line would come to the surface. It is proposed to have three tracks, two for slow and one for fast traffic. The tunnel under the harbour, which has a clay bed, would be a twin-shield tunnel. The costs of the various portions of the system are estimated to be £1,630,000, £780,000, and £750,000 for the city, harbour-tunnel, and suburban sections respectively, making a total of £3,160,000.

Wireless Synchronised Clock System.—Dr. Reithofer, of the Electrotechnical Institute of Vienna, and a clockmaker, Herr Morawetz, have devised a system of synchronising a number of electric clock installations by Hertzian waves, and successful experiments on a fairly extensive scale have been carried out in Vienna. The city authorities have assisted financially and, it is said, are favourable to the practical application of the system. According to the *Elektrotechnische Zeitschrift* a seconds pendulum at the central station causes a contact wheel to make one rotation in one minute and at the end to close a circuit and operate the Hertzian wave apparatus. The master clock of each installation within range of this central station is provided with a receiving apparatus, and is allowed to move a minute forward only when a certain contact controlled by the receiving apparatus is closed. By mechanical means the master clock is sensitive to a received impulse only one-half of a second before the impulse is due, and is rendered insensitive directly an impulse has been received. If waves from another source are received in the half-second before the proper signal is due, the clock is corrected by the impulse at the end of the next minute.

Suggested Inaccuracies in D.C. Ampere-hour Meters.—An article in a recent issue of the *Elektrotechnische Zeitschrift* calls attention to the fact that the presence of mercury vapour in testing laboratories has a very appreciable effect on the readings of ampere-hour meters of the permanent magnet type in which the contact brush and collector are exposed to the atmosphere. Some tests on a 110-volt 10-ampere meter, with a silver collector and a brush of an alloy of gold and silver, are described. This meter had been in practical use for some months, registered an amount equivalent to about 900 hours at full load, and on test gave a maximum difference between several readings of 1·4 per cent. at full load, 1·4 per cent. at half-load, and 4·7 per cent. at one-tenth load. A small piece of amalgamated brass was placed near the contact, and after four days repeated tests showed that the readings were 4·9 per cent., 15·3 per cent. and 21·6 per cent. lower at full, half, and one-tenth load respectively than before. In these four days an amount corresponding to fourteen hours at full load was registered. The collector, which had remained bright during the previous months' working, had grey markings on its surface, and it was evident that the inaccuracy was due to the effect of the mercury vapour from the amalgamated brass on the contacts.

Maintenance Contracts for Storage Batteries.—An article in a German contemporary states that of twenty-five large traction and supply companies written to by the author of the article, in the year 1908, only fifteen had contracts with the makers of their storage battery plant for upkeep. Of the amounts paid yearly to the makers for this, the minimum was 3·16 per cent. and the maximum was 9·8 per cent. of the capital cost of the plant. The capital cost per ampere-hour for every 100 cells varied between the limits of 20s. and 63s., and the yearly sum for upkeep between 1·2s. and 3·5s. per ampere-hour and 100 cells. In some cases old battery plants were still being maintained at 4 per cent. of the original capital cost, whereas several new contracts had been made for from 7 to 10 per cent. Nearly 40 per cent. of the authorities had abandoned their contracts for upkeep and taken the responsibility on their own shoulders. Some had made special arrangements with accumulator firms to make periodic inspections of their batteries.

WHAT IS BITUMEN?

IN our issue for February 11th we referred to a case under the Merchandise Marks Act, in which Mr. W. H. Keys, of West Bromwich, is summoned for selling as genuine Trinidad bitumen a composition which, in fact, contains a comparatively small percentage of pure bitumen, thus, it is alleged, coming within the section relating to false trade descriptions. Since our previous report, Mr. Chester Jones, the magistrate at the Thames Police Court, where the summons is being heard, has held weekly sittings. On Monday the case was completed, and the magistrate is now considering his decision.

It will be remembered that Messrs. Prévité have the sole concession for exporting bitumen from Trinidad either from the lake or from the surrounding land. They have given Messrs. Callenders Cable & Construction Co. the call of all the bitumen required for electrical purposes, and it is made a condition of the supply through the various agents and brokers that no other firm is to be supplied with Trinidad bitumen (by which is inferred bitumen from either the lake or the land) for electrical purposes. It is alleged, on the other hand, that the firm of W. H. Keys are supplying and advertising "genuine Trinidad bitumen" for electrical purposes.

The evidence for the defendant admits that, generally speaking, Keys No. 3, which has been sold for electrical purposes, consists of about one-third manjak, mixed with Texas oil as a flux, one-third Staffordshire clay, and one-third Derbyshire gypsum. Manjak, it will be remembered, is practically pure bitumen found in Trinidad. This composition has been advertised as "genuine Trinidad bitumen," but the main contention of the prosecutors is that the usage of the term "genuine Trinidad bitumen" relates specifically to bitumen from the island of Trinidad, and that, therefore, it is a false description to call Mr. Keys' composition "genuine Trinidad bitumen." Further, manjak has been stated to be more like an anthracite coal than bitumen. On the other hand, the magistrate has pointed out that in all the official returns the bitumen exported from Trinidad is classified as asphalte, and more than once during the proceedings has expressed the opinion that both the prosecutors and the defendant were equally at fault in calling either of their materials "genuine Trinidad bitumen," as the bitumen was only obtained by treatment after either the lake material or the manjak was procured. The defence called a large amount of evidence from firms using Keys' No. 3, and also testified that the Admiralty were now using this, as it complied with the Admiralty bitumen specification more closely than did the actual material taken from the lake without any of the additions made in the case of Keys' No. 3. The Admiralty specification states that the bitumen must not contain more than 30 per cent. of mineral matter, whereas the material procured from the island does contain more than this quantity. Evidence was also given to show that contracts have been placed with Mr. Keys as the result of competitive analysis between his composition and that of the island. On one occasion Mr. Keys supplied some bitumen to Messrs. Rowland Carr & Co., with a distinct statement that it did not come up to the Admiralty specification. Nevertheless, Messrs. Rowland Carr & Co. supplied this to the Admiralty, with the result that it was rejected. As a consequence, finding that his reputation was likely to suffer from this, Mr. Keys applied to the Admiralty to be placed on their list of contractors, which request has been complied with.

Whereas, on the one hand, the witnesses for the defence were all agreed that Mr. Keys could justifiably call his composition pure Trinidad bitumen, the prosecutors called a number of witnesses, none of whom, however, had had any experience with electrical work, but who were all connected with paving, and who were equally emphatic that if they were supplied with any material of the composition of Keys' No. 3, they would reject it as not being pure Trinidad bitumen. None of the witnesses for the prosecution, moreover, manufactured bitumen to a specification, but merely purchased the raw material from the island, and treated it in their own way for their own special purposes. Among the witnesses called for the defendant were a representative of the British Electrical Federation, the Cable Overseer to the Navy, and the Assistant Manager of the Contract Department of Messrs. Crompton & Co., and they all made the point that, as their specification asked for certain proportions of nonbituminous matter, it did not concern them where this came from so long as there was a proper proportion of pure bitumen in what they purchased.

Mr. Bodkin, in addressing the magistrate on behalf of the prosecutors, relied upon certain precedents which, he claimed, governed this case. He quoted instances where goods had been sold as coming from a particular country, when, in fact, the parts came from other countries, and were merely assembled in the so-called country of origin. This had been held to be contrary to the Merchandise Marks Act, and so, in this case, as only about one-third of the material came from Trinidad, it was a breach of the law to describe it as "genuine Trinidad bitumen." In response, Mr. Vachell, K.C., for the defendant, pointed out that Mr. Bodkin's precedents related to a totally different class of case. The cases which Mr. Bodkin had quoted were those in which it was alleged that the goods had been manufactured in a particular country, when, in fact, they had not. In this case there was not the slightest suggestion that Mr. Keys advertised that his composition was manufactured in Trinidad, but what he did claim was that the bituminous matter which was in his material was genuine Trinidad bitumen. He therefore claimed that the case for the prosecution had failed.

As stated above, the magistrate is now considering his decision.

LOCAL NOTES

BANBRIDGE: *The Electric Lighting Scheme.*—Messrs. Wilkins & Burden, consulting electrical engineers, of Dublin, with reference to the proposed electric lighting of the town, offer to take the responsibility of making the scheme pay by entering into a bond whereby they would forfeit an adequate and substantial amount should a net profit not be realised on or before the fourth year of working, on condition that they be retained to advise upon the management of works after erection. The consideration of the scheme was deferred.

BLACKPOOL: *Electrical Exhibition.*—We briefly referred in our last issue to the opening of an Electrical Exhibition, organised by the Electricity Committee. Mr. C. F. Furness, the Borough Electrical and Tramways Engineer, has since sent us a copy of the official catalogue, from which we see that there are 44 exhibitors at the exhibition, consisting of many local electrical contractors, and a large number of leading electrical manufacturing firms, including Robertson Electric Lamps, Ltd., the Chloride Electrical Storage Battery Co., Ltd., the Dowsing Radiant Heat Co., Ltd., the E.M.F. Manufacturing Co., Messrs. Babcock & Wilcox, Ltd., and Messrs. J. Hopkinson & Sons. A feature of the Exhibition, which continues until March 13th, is the ideal electrical kitchen, in which practical demonstrations in electric cooking are given at intervals by Miss A. Wilkinson. The Exhibition is organised purely for the benefit of the consumer, and consequently the application of electricity is seen in its most varied forms. In addition to the firms exhibiting, many other important manufacturing companies were good enough to loan apparatus and specialities.

BRIERLEY HILL: *The Light Railway.*—A light railway order was granted some years ago to the Brierley Hill, Rowley Regis, and Quarry Bank Councils, and, as reported in these columns, efforts were made to arrange terms with a syndicate for putting the order in force. This, however, fell through, and two of the Councils are desirous that the scheme should be proceeded with as a municipal undertaking. The Rowley Regis Council, however, does not seem disposed to fall in with the proposal, and the suggestion has been made that they should be relieved of their powers under the order, so as to allow the scheme to proceed at the hands of the other two authorities.

BIRMINGHAM: *Electricity Extensions.*—The recommendation of the Electric Supply Committee that an application should be made for a loan of £149,000 (ELECTRICAL ENGINEERING, February 25th, p. 194) has been passed by the Corporation.

CAPE TOWN: *Chamber of Commerce.*—An electrical trade section has been formed in connection with the local Chamber of Commerce.

CARDIFF: *Depreciation of Tramway and Electricity Undertakings.*—The Finance Committee anticipate an increase in the rates of 5d. in a £, mainly owing to the need for providing depreciation funds for the tramways and electric supply undertakings, a 1½d. rate having to be levied in respect of both undertakings. A committee has been formed to go into the question of increasing fares on the tramways, and Mr. Arthur Ellis, in regard to the provision that the cost of electricity meters had to be repaid out of revenue, told the committee that the rules and regulations of the Local Government Board are making municipal trading at a profit impossible.

Tramway Estimates.—Mr. Arthur Ellis estimates that the expenditure for 1909–10 upon the tramways will be £119,000 against £115,000 in the current year. The increase is due to the need for setting aside £11,000 for repairs instead of £7,000, as hitherto. It is pointed out, however, that it is possible that this extra expenditure will save a portion of the £7,000 for repairs in subsequent years. Mr. Ellis also points out that corrugation troubles had been almost, if not entirely, got over by the use of grinders. A rearrangement of the fares is also recommended. Tram fares in Cardiff are lower than in any other town in the United Kingdom, and an increase in the revenue by £10,000 per annum is anticipated by slight increases and adjustments.

The Tramway Undertaking.—Notices have been given of two motions dealing with the tramways. One asks that

Digitized by Google

an expert should be appointed to examine the tramway tracks and report upon the best method of maintaining them in a satisfactory and safe condition. The other urges the appointment of an expert to advise as to the best way of economising in the working of the tramway system in order to prevent the undertaking becoming a charge on the rates.

DUBLIN: *Condition of Tramway Track.*—The Corporation had issued eighteen summonses against the Dublin United Tramways Co. for alleged failure to maintain their tracks in an efficient state of repair, so that they should not be dangerous to ordinary traffic. The company, however, have obtained a writ of prohibition against the hearing of the summonses, on the ground that the magistrate has no jurisdiction, and that the matter must go to arbitration.

FINCHLEY: *Opposition to Power Bill.*—The Council has been inviting other Councils in the North of London to undertake a joint opposition to the Bill of the North Metropolitan Electric Power Supply Company, which comes before a Committee of the House of Commons to-day.

GLASGOW: *Tramway Extension.*—The tramway extension between Alexandria and Jamestown was inspected on behalf of the Board of Trade last week by Colonel Yorke. Colonel Yorke also inspected the tramcar routes from Rutherglen to Burnside, and from Gairbraid Street to Springburn, and went over the Dalmuir extension.

HASTINGS: *The Electricity Undertaking.*—A communication has been received from the Hastings and St. Leonard's Ratepayers' Association advising the Council to dispose of the electricity undertaking.

HESSLE: *Electricity Supply.*—Mr. H. Bell, the Electrical Engineer to the Hull Corporation, reports that he thinks it would be better for the Corporation to acquire the Hessle Council's electric lighting order, than to give a supply in bulk. He estimates the revenue from private lighting during the first year would be £970, and the revenue, including £240 for street lighting, of £1,260. The expenditure, including capital charges and interest on repayment of loans would be £1,821. The undertaking would, however, with careful management, ultimately be turned into a profitable one. In the event of this proposition being accepted, an application will have to be made to the Board of Trade for a transfer of the Hessle Order.

HESTON AND ISLEWORTH: *Electricity Accounts.*—The report of the Electrical Engineer for 1908 states that the result of the year's working has been a net profit of £80, after meeting capital charges. The total output was 537,485 units, private lighting, public lighting and power, representing practically an equal amount. Private lighting revenue shows an increase, in spite of the use of metal filament lamps, of about 12 per cent. The total cost of production, excluding capital charges, was 1·310d. per unit, a reduction of 0·069d. per unit. The output has been increased by 87,000 units and the revenue by £700. The revenue deficiency on the undertaking has now been reduced to £1,124.

IPSWICH: *Tram Fares.*—The Corporation is to carry out an experiment with halfpenny fares on the local tramways.

KIRKCALDY: *Tramway Track.*—The track of the Wemyss tramways having sunk in places, permission has been granted the company for the laying of a temporary track whilst the necessary repairs are carried out.

LONDON: *Islington: Financial Position of Electricity Undertaking.*—The Finance Committee of the London County Council has reported upon the financial position of the Borough Council's electricity undertaking, and specially draw the attention of the County Council to it in relation to the inadequacy of the reserve fund. Whereas the provision for repayment of loans is now only 15 per cent. of the capital expenditure, if the present terms of repayment were calculated from the date of the commencement of the undertaking, this should have been 29 per cent. of the capital expenditure. Further, on a total capital expenditure of £454.970, the reserve fund only amounts to about £15.000, and in view of the circumstances, the Finance Committee bring the matter before the County Council, although they confess they have no power to compel the Borough Council to alter its policy hitherto. The difficulty has mainly arisen through the policy of the London County Council in the early days of allowing 42 years as the period for the repayment of all loans, irrespective of the purposes to which the money was to be applied. Although this policy has now been changed, the Islington Council cannot see their way to put the necessary charges on the undertaking in order to arrive at the larger reserve fund suggested. The Finance Committee is going into this question in relation to all the London Borough Council electricity undertakings, but has dealt with Islington first.

Woolwich: Land Arbitration.—An arbitration has been held in respect of the acquisition of a portion of the riverside property of the Thames Steamboat Co., Ltd., in Woolwich, for the extension of the municipal electricity works. Mr. Hutton, the Tower Bridge Police Court magistrate, who acted as arbitrator, reserved his decision.

MANCHESTER: *Tramway Regulations.*—The Manchester Ratepayers' Association has forwarded a letter to the Lord Mayor, urging the drafting of proper regulations to prevent the tramcars travelling as closely together as they do at present, which has been the cause of so many accidents to ordinary vehicular traffic.

MIRFIELD: *Tramways.*—A deputation from the Council waited upon the Huddersfield Corporation last week, to urge the extension of the Huddersfield tramway system to Mirfield. The chief difficulty is the widening of the bridge at Bradley, which it is estimated will cost £2,000, and the County Council is to be approached with a view of ascertaining to what extent they will contribute to this. Further, the British Electric Traction Co. are to be approached in order to arrange for the coupling up of the proposed extension with the lines of the Yorkshire Woollen District Co. When these two latter points have been debated, a further conference with the Huddersfield Corporation will take place.

NEWCASTLE: *Tramway Men's Grievances.*—A long list of grievances having been put forward by the tramway employees, the Tramways Committee have reported. One of the chief complaints is in regard to working hours, it being urged that the day should not exceed nine hours, and should be worked within a period of twelve hours. This matter is to be further considered. A re-arrangement of the holidays is refused, as is also a request that arrangements should be made for the men to get Saturday night off in rotation. The manager, however, has been instructed to try and arrange for the men to have one Sunday off in two.

OXFORD: *Tramway Question.*—As hinted in our last issue, the Tramways Committee have recommended that the Council should accept a combination of the conduit and overhead systems. In their report they specify the particular routes upon which they require the conduit system to be laid, and, further, recommend that the National Electric Construction Co. and the City of Oxford Electric Tramways, Ltd., give the Corporation a substantial and satisfactory guarantee for the due performance of their obligations under the existing and amending Acts. The report further states that the whole of the costs of the Corporation incurred since August, 1908, in connection with this matter shall be paid by the Companies, and that these recommendations are to be regarded merely as a basis of negotiations. Sir Alexander Kennedy is to advise the Corporation during the progress of the negotiations.

REIGATE: *Electricity Charges.*—A recommendation by the Lighting Committee, increasing the charge for electric supply on the maximum demand system from 7d. and 4d. to 7½d. and 4½d. per unit, and for the flat rate system from 5½d. to 6d. per unit, and further abolishing discounts, has been adopted by the Council. Meter rents will also be charged in future. The Chairman of the Electricity Committee stated that the opinion was now held that the time had come when the general body of ratepayers ought to be relieved of paying a rate every year towards maintaining the electricity works. Hitherto the consumers had been supplied with electricity at less than cost price, and, although the proposals were somewhat drastic, he saw no other method of dealing with the matter.

RHYL: *Electricity Works.*—At a recent meeting of the Council, it was pointed out that the Electricity Works were showing a deficit of about £1.200 per annum, and it was urged that, as a neighbouring authority had been offered electrical power in bulk at 1½d. per unit by the North Wales Electric Power Co., it would be wise for the Corporation to take the matter up with this Power Company, especially as their total costs in Rhyl were about 2¾d. per unit. The Chairman of the Electricity Committee, however, stated that, having opposed the North Wales Bill, and succeeded in getting Rhyl excluded from its scope, it would be folly to go back upon their attitude in the past, and take a supply from the Power Company.

The Light Railways Scheme.—At the recent inquiry by the Light Railways Commissioners into the proposed light electric railway from Rhyl to Prestatyn, the Corporation opposed, and the Commissioners adjourned in order to permit of a poll of the ratepayers being held. At the same time, they had no power to enforce the taking of a poll, and the Special Light Railway Committee of the Corporation have recommended that it should not be carried out. This recommendation has been adopted by the Council.

SALFORD: *The Electricity Committee.*—The Mayor at the last meeting officially announced the receipt of the resignations of Mr. Barrett, the Chairman of the Electricity Committee, and Alderman Rudman, Councillor Hailwood, and Councillor Grundy, members of the Committee. The resignations were received with regret.

SOUTHGATE: *Transfer of Provisional Order.*—The Southgate electric lighting order, 1904, is to be transferred to the North Metropolitan Electric Power Supply Co., the consideration money payable in respect of the transfer being £305. The Company has altered the suggested terms of re-purchase from 21 or 28 years to 14, 21, or 28 years; also that the purchase price be ¼ instead of ⅓ addition to the capital expenditure. The Council has accepted these terms.

SOUTH AFRICA: *Durban Electric Supply.*—The accounts of the municipal electric supply undertaking for 1908 show a net profit of £14,762, after providing for 4 per cent. depreciation and capital charges.

SOUTH SHIELDS: *Electricity in Mining.*—The Horten Coal Co. intend to establish a new coal mine in South Shields,

Digitized by Google

close to the sea shore, in the immediate neighbourhood of Bent House Farm. Electricity will be used almost exclusively in the working of the new mine.

The Proposed Tyne Tunnel.—The promoters of the proposed electric railway under the Tyne have asked the Corporation to grant them another interview with a view to re-opening negotiations. The Corporation has declined to do this, or, indeed, to take any further action in the matter, unless the other Corporations interested show a disposition to re-consider the question.

STALYBRIDGE: *Joint Tramway Board.*—The Manager of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board reports that the receipts from March 31st, 1908, to date, amount to £33,552. The total amount borrowed for the purposes of the undertaking is £481,940, out of which £47,756 have been repaid.

TORQUAY: *Tramway Extensions.*—The arrangement come to between the Corporation and the Tramway Company for the extension of the tramways to Paignton, on the overhead system, includes a payment by the former of £450 towards the expenses of the necessary road widenings, the total cost of which is estimated at £1,500. The Corporation, however, anticipate that half of the £450 will be borne by the County Council. The Great Western Railway Co. is to oppose the extension to Paignton, as at present they have a monopoly of the traffic between there and Torquay.

WELLS: *Power Company's Bill.*—The Lighting Committee have recommended that no action be taken with regard to the Bill of the Somerset & District Electric Power Co., which is now before Parliament.

WEST HAM: *The Proposed "Eastminster."*—At a meeting of the West Ham Municipal Alliance last week, Mr. F. Duncan West read a Paper upon the proposals advanced recently by Alderman Littler, of West Ham, for the amalgamation of a number of districts in the East of London into a large borough to be called "Eastminster." One of the proposals put forward in the Paper was that during the daytime and also at night when the traffic is at its lowest upon the various tramway undertakings involved, a system of goods transport should be carried on. The West Ham Tramways Manager thinks the plan a feasible one, and the proposal is to erect a number of depôts close to the various factories in order to give the necessary facilities for the carrying of goods and raw material.

The L.G.B. and Power Contracts.—In reference to the recent Local Government Board inquiry, the Town Clerk has received a letter from the Board asking that in the first instance the contracts in question be forwarded to them with any observations which the Council may wish to offer in regard to particular cases. The question of the necessity or otherwise of making public the contracts at the resumed inquiry would then be further considered in connection with the facts disclosed by the contracts, but in any case no direction will be given by the Board in the matter until they had communicated further with the Council and considered any representations they might desire to submit. The Town Clerk, in accordance with this, has forwarded the whole of the contracts for power supply to the Board. An offer to do this was made on behalf of the Council when the public production at the inquiry had been declined.

WIRRAL PENINSULA: *Proposed Electric Railway.*—It is stated that a syndicate has been formed for the purpose of constructing an electric railway to connect up the outlying districts of Birkenhead and New Brighton, and to act as a feeder to the existing railways, whose termini have become rather out of touch with their districts owing to the growth of recent years.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—The Electrical Engineer has submitted a report with reference to the extensions of electrical mains, which will involve an outlay of about £2,076.

BOLTON.—A Local Government Board inquiry has been held into an application by the Corporation for sanction to borrow £25,000 for electricity mains. There was no opposition.

BRIGHTON.—The Corporation invite tenders by March 22nd for a 300-kw. three-phase induction motor generator. (See an advertisement.)

CARLISLE.—The Local Government Board has sanctioned a loan of £1,000 for the provision of a coal elevator at the electricity works.

FERMOY.—A public meeting was held on 6th inst. for the purpose of taking into consideration the advisability of forming a company for the electrical lighting of the town. Mr. F. C. Porte, Cork, was in attendance to submit a scheme. The scheme, he stated, would roughly cost about from £5,000 to £6,000. As a result of the meeting 2,000 £1 shares were taken up, and a detailed statement of the scheme is to be placed before another meeting, which will be held in a fortnight or so.

GRAYS, ESSEX.—Tenders are invited for three electrically-driven centrifugal pumps. Particulars from the Borough Surveyor, and tenders by March 25th.

LONDON: *St. Pancras.*—A loan of £12,077 for electric lighting purposes is recommended by the Finance Committee of the London County Council.

MANCHESTER.—Tenders are invited for the supply and erection of a storage battery, boosters, exciters, and switchboards at the Dickinson Street generating station. Particulars from the Secretary to the Electricity Department, and tenders by March 16th.

MEXBOROUGH.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £4,000 for electric lighting purposes.

SYDNEY (AUSTRALIA).—Major Cardew, who originally designed the Sydney Municipal electric supply scheme, is to visit Australia in connection with an extension of the undertaking. Plant capable of supplying a further 80,000 16-c.p. lamps is contemplated.

Tenders are invited for two 4,705-k.v.a. turbo-alternators, and one 447-k.v.a. turbo-alternator (see an advertisement this week).

WALSALL.—An expenditure of £2,143 upon mechanical stokers for the Electricity Works is to be incurred.

WEDNESBURY.—The Local Government Board has sanctioned a loan of £1,700 for the purpose of laying underground mains from King's Hill to Darlaston.

YARMOUTH.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £2,500 for mains in the Gorleston district.

Miscellaneous

ACCRINGTON.—The Electricity Committee require two double-deck and one single-deck tramway car.

BRAY.—The Council invite tenders by April 6th for stores for the electricity works. (See an advertisement.)

AUSTRALIA.—The date for the receipt of tenders for the supply of power plant to the Central Telephone Exchange at Melbourne has been extended from March 23rd to April 23rd.

It is estimated that an expenditure of £1,200,000 will be required within the next three or four years upon the Commonwealth telephone systems in order to bring them up to date, and meet the demands now being made upon them.

DARLINGTON.—An application is to be made to the Local Government Board for sanction to borrow £3,900 for the purchase of an exhaust steam turbine for the electricity works.

EDINBURGH.—Tenders are invited for electrical stores for the year commencing May 16th, 1909 (see an advertisement this week).

ROTHERHAM.—Tenders are invited for the supply and delivery of six double-deck top covered tramcars. Particulars from the Tramways Manager, and tenders by March 18th.

RUGBY.—A proposal to adopt electricity for street lighting purposes has been referred to a Special Committee.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—Additions to Whitechapel Foundation School, Old Montague Street, for the Governors.

E.C.—Workmen's dwellings, City Road (£5,560). Architect, E. C. P. Monson, Finsbury Pavement House, E.C.

N.W.—Alterations to Parish Church (£6,000), Hendon. Rev. S. E. Chattoe, Vicar.

S.W.—Erection of "Pension," Woodside, Wimbledon. Architect, R. A. Hinds, Wood Nook, Wimbledon Hill, Wimbledon.

High School for Boys, "Reay" Estate, Brixton. T. J. Bailey, Architect, L.C.C. Education Committee, Victoria Embankment.

W.—Radium Institute, Riding House Street, Portland Place. Architect, T. P. Figgis, 28 Martin's Lane, Cannon Street, E.C.

PROVINCES.

BARNSTAPLE.—Elementary School (£3,000). Architect, E. Saunders, Barnstaple.

COLCHESTER.—Super-structure of Asylum (£189,691). Architects, F. Whitemore, County Architect, and W. H. Town, Colchester.

CHELTENHAM.—Empire Theatre of Varieties. Architects, Wylson and Long, King William Street, E.C.

DUNFERMLINE.—Technical School. Architects, H. and D. Barclay, 243 St. Vincent Street, Glasgow.

DUBLIN.—Workhouse, Trinity Street. Architect, F. Hayes, Nassaw Street, Dublin.

EXETER.—Additions, Workhouse (St. Thomas). Architect, J. Stocker, Cowick Street, Exeter.

GLASGOW.—Justiciary Court (£10,000). Architects, Clark and Bell, 212 St. Vincent Street, Glasgow.

HUDDERSFIELD.—Palace Theatre (£11,600). Architects, R. Horsfall and Son, 22A Commercial Street, Halifax.

Digitized by Google

HEREFORD.—New wing, Training College. Architect, R. A. Jack, Shire Hall, Hereford. Builder, E. Wilkes, Hereford.

KINGSWOOD (BRISTOL). School. Architect, R. S. Phillips, Gloucester.

LOWESTOFT.—Additions, Isolation Hospital. Architect, G. Hamby, Town Hall, Lowestoft.

LEEDS.—Offices, Pearl Assurance Co. Architect, W. Bakewell, 38 Park Square, Leeds.

NEATH.—Bank, Metropolitan Bank of England and Wales. Builders, Lloyd Bros., Swansea.

NEWCASTLE-ON-TYNE.—Conservative club. Architects, Cockett & Burns-Dick, Pilgrim Street, Newcastle-on-Tyne.

PLYMOUTH.—Church. Architects, Scoles & Raymond, Basingstoke. Builder, A. M. Coles, Plymouth.

Presbytery and Roman Catholic Church, junction of Holland Road and Home Park Avenue.

RENFREW.—The Renfrew Landward School Board invite tenders for the electric wiring of the new school at Victoria Drive, Scotstown. Particulars from the architects, Messrs. Kerr & Watson, Johnstone, N.B.

SWANSEA.—A Committee has been formed to consider the question of lighting the day schools by electricity.

TODMORDEN.—New secondary school. Architect, J. Horsfall, 4 Chapel Walks, Manchester.

WEYMOUTH.—School. Architect, E. J. Bennett, 10 Gloucester Street, Weymouth.

WREXHAM.—New church at Hightown (£6,210). Architects, Prothero, Phillott & Barnard, 13 Promenade, Cheltenham.

TENDERS RECEIVED AND ACCEPTED

BLACKBURN.—The Council has placed a contract with the Chloride Electrical Storage Co., Ltd., for a storage battery and booster for the Electricity Works, and another with the British Westinghouse Electric & Manufacturing Co., Ltd., for the supply of an electric motor generator.

BURTON-ON-TRENT.—Orders for the supply of slack coal to the Electricity Works have been placed with local firms as follows:—Mr. C. Spalding, 4,500 tons; Messrs. Marriott & Co., 2,500 tons; and Mr. R. B. Barratt, 2,500 tons.

COMMERCIAL CABLE CO.—A contract has been placed with the Telegraph Construction & Maintenance Co. for the new cable of the Commercial Cable Co., 1,700 miles in length, to complete the diversion of one of the Company's trans-Atlantic cables from the Flemish Cap to St. John's, Newfoundland, and thence direct to New York City.

EAST RAND (SOUTH AFRICA).—It will be remembered that the East Rand Mines were recently in the market for three 3,000-kw. turbo-generators complete with surface condensing plant, the plant being required for generating power for their own mines in preference to purchasing from the Victoria Falls Power Co. A contract has just been entered into between the East Rand Mines and Messrs. Hubert Davies & Co., of Johannesburg, for the supply of plant manufactured by Messrs. Willans & Robinson, Ltd., of Rugby. The mechanical portions are being built by Messrs. Willans & Robinson, Ltd., and the alternator by Messrs. Dick, Kerr & Co., Ltd.

LONDON: *London County Council.*—The tender of the Harper Electric Co. at £335 for the electric lighting of the Redman's Road School of the London County Council has been accepted.

The tender of Messrs. Punching & Walton at £1,167 for the installation of electric lighting and bells and the wiring for ventilating fans at the London County Council School of Building, Brixton, has been accepted.

Battersea.—The Council have entered into an agreement with Callender's Cable & Construction Co., Ltd., for the supply of cables, &c., for the ensuing year.

Hammersmith.—The Council have accepted the following tenders in connection with the electricity undertaking: Floor, &c., main switchboard, Dorman, Long & Co., £70 15s. 7d.; 12 panels for switchboard, Cowans, Ltd., £15 16s. per panel; annual supplies, electrical goods, General Electric Co., £22 0s. 9d.; arc lamps, globes, and lamp shades, H. G. Mayer & Co., £20 6s. 7d.; meters, General Electric Co., 3 amps., £1 7s., 5 amps., £1 7s., 10 amps., £1 7s., 25 amps., £1 15s., 50 amps., £2, 75 amps., £2 10s., 100 amps., £3 5s., 250 amps, £4 5s., 500 amps, £6 (2½ per cent. discount off).

Marylebone.—The Council received 18 tenders for the work to be done and materials to be supplied for the proposed conversion of 1,964 street lamps to electric lighting. They have accepted the tender of Haydn Harrison at the following rates: Fittings for twin lamp lanterns, 12s. 3d. each; fixing on site, 3s. 6d.; fittings for triple lamp lanterns, 16s. each; fixing, 4s.; wooden rods for turning on and off, 1s. each, spare parts; complete switch in chamber, 5s. 6d.; sealing chambers, 1s. 9d.; reflectors, two-light, 3s. 9d.; three-light, 6s. 6d.; enclosed fuse carriers, 4d. each. [We refer to this matter in an editorial note.]

Woolwich.—The Council have received the following tenders for the supply of service cables:—W. T. Henley's, less 2½ per cent., £194 per mile; Western Electric Co., £196 9s.; Callender's, less 2½ per cent., £196 10s.; Johnson & Phillips, less 2½ per cent., £196 10s.; W. T. Glover & Co., £197 10s.; Siemens Bros. & Co., £198 10s. The tender of Messrs. Siemens Bros. & Co., although the highest, has been accepted, having regard to the expense which would be incurred in carrying out tests, as the cable is to be manufactured in the Borough.

PLYMOUTH.—The Town Council have accepted the following tenders for annual supplies in connection wth the electricity undertaking:—Carbons, price per 1,000 ft. (last year's price, £4), G. Braulik (accepted) (Contradty C), £2 17s. 6d. House meters, average price (last year's price, £1 15s. 11d.), British Westinghouse Co., Ltd. (accepted), £1 9s. 4d. Transformers, average price per kw. (last year's prices, £1 19s. 1d. and £1 18s. 10½d.), British Electric Transformer Co., Ltd. (accepted), £1 17s. and £1 17s. 1d. The tender of the British Insulated Cables, Ltd., has been accepted for cables at £114 0s. 6d. average price, last year's average being £116 5s. 9½d.

MISCELLANEOUS CITY NOTES

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the Register, and are dissolved:—Hammersmith Electricity Supply Co.; Hyde Electrical Manufacturing Co.; Irish Electrical Agency.

WESTERN TELEGRAPH CO.—A second quarterly interim dividend of 3s. per share, free of income tax, for the year ending June 30th, 1909, being at the rate of 6 per cent. per annum, has been declared.

GLOBE TELEGRAPH & TRUST CO.—A quarterly dividend of 2s. per share has been declared upon the ordinary shares.

CANADIAN GENERAL ELECTRIC CO.—A dividend of 1¾ per cent. on the common stock is announced for the March quarter.

DIRECT SPANISH TELEGRAPH CO.—A dividend at the rate of 4 per cent. (free of tax) is announced on the ordinary shares for the half-year to December 31st.

GATESHEAD & DISTRICT TRAMWAYS CO.—A dividend of 7 per cent. on the ordinary shares for 1908 is recommended.

AUCKLAND (N.Z.) ELECTRIC TRAMWAYS CO.—An issue of 50,000 ordinary shares of £1 each has been made locally.

BRITISH INSULATED AND HELSBY CABLES.—A final dividend of 6s. per share is recommended, carrying £64,000 to reserve, and £51,000 forward.

BRITISH INSULATED & HELSBY CABLES.—The transfer books will be closed from the 13th to the 22nd inst., both days inclusive, for the preparation of warrants for dividend on the ordinary shares of this company.

SAO PAULO TRAMWAYS, LIGHT AND POWER CO.—A quarterly dividend of 2½ per cent. is announced on the ordinary shares.

STEWARTS & LLOYDS.—A dividend of 6 per cent. is recommended upon the preference shares, and 11 per cent. on the ordinary shares, placing £30,000 to reserve fund, £70,000 to depreciation, and carrying forward £85,900.

KRIEGER ELECTRIC CARRIAGE SYNDICATE.—A petition for the reduction of the capital of this company from £100,000 to £72,250, will be heard before Mr. Justice Parker in the Chancery Division on March 20th.

BUENOS AYRES GRAND NATIONAL TRAMWAYS.—The scheme of amalgamation with the Anglo-Argentine Tramways Co., Ltd., was sanctioned by Mr. Justice Swinfen Eady in the Chancery Division on Tuesday.

VICKERS, SONS & MAXIM.—A final dividend of 1s. per share, free of income tax, making 10 per cent. for the year on the ordinary shares, is recommended, carrying forward £186,672.

Wireless Telegraphy and Telephony.—As previously announced in these columns, the Bill for the compulsory use of wireless telegraph apparatus on various classes of American passenger vessels has already passed the House of Representatives. The Bill is now meeting with some opposition in the Senate, however: the Commissioner of Navigation has urged its amendment by requiring all companies to exchange messages in time of distress or emergency, and a provision preventing the formation of a wireless combination has also been suggested.

The Japanese steamship *Aki Maru*, which has arrived at Seattle from Yokohama, reports that during the whole of her 4,240 miles voyage she was in wireless communication with land.

Telegraph Traffic.—The Indo-European Telegraph Co. has suffered interruption to its lines between Rowno and Odessa, which were down on the 2nd inst., and another portion of their lines became disabled on the 3rd inst., between Tiflis and Tauris. The Hanekin and El Arish routes were again working normally on the 5th inst. The French Cable Co.'s cables between Martinique and Paramaribo, and between Cayenne and Salinas (Brazil), are both interrupted; telegrams for Dutch and French Guiana and Brazil can now, therefore, only be sent via the Eastern Telegraph Co.'s routes, and they would have to be posted from Salinas. The cable between New York and Cape Hayti also ceased operating on February 25th, and the route via Hayti is therefore closed, excepting via Cuba.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 10s. to £59 per ton (last week, £59 10s. to £60).

BANKRUPTCIES, LIQUIDATIONS, WINDINGS UP, &c.—A meeting of creditors of the Santoni Arc Lamps & Engineering Co., Ltd., will be held at the offices of the liquidator, Mr. W. McIntosh Whyte, 8 Mansion House Chambers, 11 Queen Victoria Street, London, E.C., on Tuesday, March 16th, at 2 p.m.

A meeting of creditors of the Rex Electric & General Supplies, Ltd., will be held as above on Tuesday, March 16th, at 11 a.m.

The receiving order made against E. P. Oliver, carrying on business as electrical engineer, under the name of Messrs. Newington, Priddle & Co., 50 Great Sutton Street, Goswell Road, has been rescinded, it being proved to the satisfaction of the Court that all the debts of the bankrupt have been paid in full.

BRITISH-MADE WATER TURBINES.—Mr. Jens Orten-Böving informs us that arrangements have been made for the manufacture of a series of water turbines from designs of his own by Messrs. Willans & Robinson, of Rugby. In the preparation of the designs, Mr. Orten-Böving has had the assistance of Mr. R. Weber, late chief constructing engineer to Messrs. Escher, Wyss & Co., of Zurich. High-pressure turbines will be undertaken first, and the manufacture of turbines of the "Francis" type will follow. In the production of the latter machines, Messrs. Willans & Robinson will be assisted by the well-known Swedish firm of Messrs. Verkstaden, of Kristinehamn, whose works are about to pass under the control of Mr. Orten-Böving, who, as is well known, represented Messrs. Escher, Wyss & Co. for some time in the country. Messrs. Verkstaden have supplied the hydraulic portion of some 250 large installations in Sweden and Finland, and delivered turbines for some 1,500 other plants in various parts of the world. Some tests of their plant, showing remarkably good efficiencies have recently been made.

ELECTRO-PLATING AND STORAGE BATTERIES.—It has been realised in the electro-plating industry that the quality of the work is dependent upon steadiness of the electric current, the slightest variation affecting the density and evenness of the deposit. The D. P. Battery Company, of Bakewell, has recently laid down a battery of an unusually large size of cell for a Midland firm, and the firm declare that there has since been a marked improvement in the quality of their manufactures.

APPOINTMENTS AND PERSONAL NOTES

Sir Oliver Lodge, F.R.S., has been gazetted Colonel of the Southern Command Telegraph Companies (Army Troops).

Mr. H. Godfrey Andrews, assistant electrical engineer to the Bournemouth Corporation, has tendered his resignation, having obtained a more advantageous position, owing to the suggested re-organisation of the tramways department.

In connection with a recent advertisement for applications for the post of Chief Electrical Engineer to the Government of Mysore, *The Indian and Eastern Engineer* states that this post is rendered vacant by the retirement of Mr. H. P. Gibbs, the present Chief Electrical Engineer.

Mr. W. A. Kitchen, fourth engineer-in-charge of the Hammersmith undertaking, has resigned his position. Two hundred and twenty-six applications were received for the appointment. Mr. E. A. Faver, of Shepherd's Bush, is to fill the vacancy.

Mr. A. G. Midgley, at present Chief Assistant Electrical Engineer to the Erith Council, has been appointed Deputy Electrical Engineer. He will now be responsible for all detail and routine matters in connection with the supply and distribution of electrical energy, and be in charge of the station and outdoor staff. Mr. Midgley's salary will shortly be increased.

The Keihan Electric Railway, Japan.—This railway, which will be the third and longest electric railway in Japan, is now under construction. It will connect Kyoto, a large town with a population of nearly half a million, with Osaka, an industrial centre with a population of nearly one million. The total length of the line, which will have a double track throughout its length, is approximately 30 miles. Power for the line will be generated three-phase in a station containing three 850-kw. steam turbo-generator units, and will be transmitted to sub-stations along the line at a pressure of 2,500 volts. In these sub-stations converting plant will transform the power into direct-current at a pressure of 550 volts for the overhead trolley-wire. The electrical equipment is being supplied by Messrs. Dick, Kerr & Co., the turbines by Messrs. Willans & Robinson, and the boilers by Messrs. Babcock & Wilcox. The European consultant and inspecting engineer to the company carrying out the work is Mr. H. S. Bickerton Brindley. There is already an ordinary railway between the two centres, but this is now insufficient to deal with the traffic. Although the standard gauge of the steam railways of Japan is 3 ft. 6 in., the new line is being constructed with a 4 ft. 8½ in. gauge.

COMPANIES' MEETINGS AND REPORTS

CHATHAM & DISTRICT LIGHT RAILWAYS CO.—The accounts for the half-year ended December 31st, 1908, shows receipts amounting to £22,830, and expenses to £13,929. The rent of the Rochester Corporation lines, interest on debentures, interest on loans, &c., and amount written off as per revenue account amounts to £3,163. Adding the balance brought forward from last account, there is a balance of £7,233. Of this amount £3,000 has been transferred to reserve for depreciation, £2,940 to dividend at the rate of 5 per cent. per annum on the preference shares, and £1,060 to dividend at the rate of 2 per cent. per annum on the ordinary shares for the half-year, carrying forward £233. The whole of the Rochester Corporation lines are now completed and leased to the company, the last, *i.e.*, Delce to Borstal, being opened in August. The traffic receipts show an increase of about £2,500 over those for the corresponding half-year of 1907. This increase is entirely due to the additional lines (2·62 miles) opened during the past year, from which, however, much better results were anticipated.

OXFORD ELECTRIC CO.—The accounts for 1908 show a profit (including £977 brought forward), of £14,669. After providing for debenture and other interest, and writing off £999 on account of hire-purchase and college installations, the balance available for dividend is £11,596. A dividend of 7 per cent. per annum, free of income tax, is recommended on the ordinary share capital, and 5 per cent. per annum on the preference shares. After transferring £2,018 to reserve and renewal of plant account, there is a balance to be carried of £1,022.

SCARBOROUGH ELECTRIC SUPPLY CO.—The report for 1908 states that the quantity of energy supplied during the year is in excess of that supplied during 1907, but the receipts have suffered mainly owing to the reduced net price for current. The accounts show that, after placing £750 to depreciation account, there is a balance of £3,943. A dividend of 3 per cent. for the year is recommended, leaving £943 to be carried forward.

At the meeting last week, the report and accounts were adopted.

GERMAN TRAMWAYS.—The directors of the Leipzig Electric Tramways Company recommend a dividend of 5 per cent. for the year 1908; the previous year's dividend was 4½ per cent. At a meeting of the directors of the Hamburg Street Railways Company, it was decided to recommend a dividend of 10 per cent. for the year 1908,, the same as for the previous year.

METROPOLITAN ELECTRIC SUPPLY CO.—The report for the year states that the gross revenue amounted to £180,672, as compared with £178,683 in 1907. The working expenses, which in 1907 were £83,334, amounted in 1908 to £80,698. After setting aside £15,000 to the depreciation and reserve fund, there remains the sum of £84,974. After deducting interest on debenture stocks and loans, dividend on preference shares and other charges, there remains a balance of £55,972. An interim dividend at the rate of 5 per cent. per annum on the ordinary shares was paid in August, and the directors recommend that a further dividend at the rate of 6 per cent. per annum be now paid, making a total distribution for the year of 5½ per cent. This will leave a balance of £972 to be carried forward to the next account. The balance at the credit of the depreciation and reserve fund now amounts to £235,355 5s. 5d. During the year new connections representing the equivalent of 69,188 8-c.p. (or 30 watt) lamps were added to the company's system, making a total connection at the end of the year of 804,304 lamps.

At the annual meeting on Tuesday, the report and accounts were adopted. Mr. W. Harrison Cripps, the chairman of the company, who presided, said that in spite of the fact that 69,000 additional lamps had been connected with the mains during the year, the increase in the revenue had been very slight, and of course the reason for this was the increased use of the metal filament lamps.

CHELSEA ELECTRICITY SUPPLY CO.—The report for 1908 shows a profit of £33,791, which, with the amount brought forward and interest, makes a total of £35,037. After deducting interest on debenture stock, interim dividend, 6 per cent. on preference shares, and interim dividend on ordinary shares of 4 per cent. per annum, there remains a balance of £21,319, which the directors recommend shall be appropriated as follows:—Renewals and depreciation fund (£11,854), debenture stock premium redemption fund (£535), amount written off cost of extinction of founders' shares (£826), final dividend on the 6 per cent. preference shares (£900), final dividend on the ordinary shares of 5 per cent. per annum, making 4½ per cent. for the year (£6,179), balance carried forward (£1,025). The number of 8-c.p. lamp equivalents connected on December 31st, 1908, was 251,110, an addition of 10,375 during the year, and the total number of units sold was 3,654,608, being 105,980 more than the previous year.

HOVE ELECTRIC LIGHTING CO.—The gross revenue for 1908 shows an increase of £1,373, the working expenses have increased by £603, and the net result of the year's working is a profit of £13,463, compared with £12,693 in 1907. There was a balance brought forward from 1907 of £497, which makes an available balance of £13,960. After deducting the preference

Digitized by Google

and ordinary interim dividends, there remains a surplus of £8,365. The directors have decided to establish a sinking fund for the replacement of the capital at the expiration of the lease, and, with this object, have transferred to the new account the premiums received on shares and debentures, £18,226, and the sum of £10,346 3s. 11d. from the renewals and depreciation account, making together £28,572 15s. 11d., all of which is invested outside the company's business. It is further proposed to place £1,500 to the renewals and depreciation account, and £2,500 to the sinking fund, to set aside a sum of £593 15s. for the accrued preference dividend to December 31st, and to declare a final dividend on the ordinary shares of 9 per cent. per annum, making 8½ per cent. for the year. This will leave a balance of £291 18s. 5d., to be carried forward. The meeting is on March 17th.

HUELVA GAS & ELECTRICITY.—The report for 1908 states that the net profit amounted to £3,193, to which has to be added £576 brought forward. The directors recommend a dividend of 4 per cent., allocating £1,000 to reserve account, writing off £1,000 against property and assets, and carrying forward £769.

CARLISLE ELECTRIC TRAMWAYS CO.—The revenue for 1908 shows a surplus of £1,437, a decrease of £347 as compared with last year. The balance, after providing for debenture stock interest and debenture stock trustees' remuneration, is £335, which it is recommended shall be carried forward. The car miles run were 353,012, the number of passengers carried 2,600,210, and the total receipts £9,617. While the first two items show an increase, there is a decrease of £124 in receipts. The working expenses are £222 in excess of 1907.

NEWCASTLE & DISTRICT LIGHTING CO.—The gross profit for 1908 amounts to £19,087. Deducting directors' and trustees' fees, income tax, &c., and making provision for leasehold redemption fund, there remains a balance of £17,864. After providing for interest on debenture stock, temporary loans, &c., there is a balance of 6,704, out of which the directors recommend a dividend at the rate of 2 per cent. per annum for the year ended December 31st last (less income tax), carrying forward £1,104.

BROMPTON & KENSINGTON ELECTRICITY SUPPLY CO.—The report for 1908 shows a credit balance of £27,794, which, with the balance of £10,136 brought forward, and balance of interest received and accrued, makes a total of £38,381. After deducting £1,695 for interim dividend on the 7 per cent. cumulative preference shares, and £6,819 interim dividend at the rate of 9 per cent. per annum for the half-year to June 30th on the ordinary shares, the directors recommend that the sum remaining, viz., £29,865 7s. 6d., be dealt with as follows:—Depreciation account, £8,000; dividend on preference shares for December half-year, £1,672; dividend on the ordinary shares for December half-year at 11 per cent. per annum, making 10 per cent. for the year, £8,369; reserve fund account, £2,000; directors' additional remuneration, £424; leaving, to be carried forward, a balance of £9,400. The meeting is to-day.

CITY OF LONDON ELECTRIC LIGHTING CO.—The accounts for 1908 show that the net addition to capital account during the year was £12,248. The total revenue for the year was £283,239, and the total expenditure, £129,852. Adding the balance brought forward from 1907, the amount available for dividend was £173,861. After providing for interest on loan from bankers, interest on debenture stock, staff superannuation fund, writing down stores, and transferring £45,000 to reserve account, there is a sum remaining of £90,443. A further dividend of six shillings per share is recommended on the preference shares, making 6 per cent. for the year, and seven shillings on the ordinary shares, making 6 per cent. for the year, carrying forward £27,404. The number of consumers on December 31st was 12,882, an increase of 361 during the year, and the total connections, incluring power and heating, 35,468 kw., an increase of 1,787 kw. The total number of units sold during the year was 23,684,575, and the maximum supply demanded, 19,163 kw. The increase in the number of units was 875,831. Power and heating units show an increase of 30·28 per cent. On the question of public lighting, the report states, the Corporation of London has not yet come to any decision. In the meantime, the company is continuing to light the majority of the main thoroughfares, and has offered to introduce more modern lamps throughout the City on favourable terms to the Corporation. This offer has not yet been accepted. The meeting is on the 17th inst.

COUNTY OF LONDON ELECTRIC SUPPLY CO.—The report for 1908 states that the capital expenditure during the year was £82,222, the total now standing at £1,646,932. The revenue for the year amounted to £172,996, and the total expenditure to £71,959, leaving a balance of £101,037, to which has to be added £4,381 carried forward. After deducting debenture interest, and interim dividends on preference and ordinary shares, there is a balance of £29,302. The further dividend on the six per cent. preference shares is recommended, and also a similar dividend upon the ordinary shares. The amount carried to reserve is £16,000. The total applications received at December 31st amounted to 32,556 kw., an increase of 2,521 kw. for the year. The total maximum supply demanded was 9,100 kw. The total units sold were 13,610,760, as against 13,970,179 for the previous year. Excluding the consumption taken by the London County Council Tramways in 1907, the units sold during 1908 show an increase of 11 per cent. Of the 15,000 preference shares issued in December, 1907, a further 2,142 shares have been allotted since the close of the year, making 12,168 shares allotted to date in respect of that issue. The meeting is on the 15th inst.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO.—At the annual meeting, on Thursday, Col. R. E. Crompton presiding, the report and account given in our issue for February 25th were adopted. In explaining the reduction of revenue during 1908 by £1,800, the Chairman said that in addition to reductions in price, Messrs. Harrods had put in their own generating plant, and H.M. Office of Works had also put down generating plant to supply several of the museums. A favourable contract, however, had been obtained for the Victoria and Albert Museum.

O. C. HAWKES.—The report for 1908 shows net profits of £3,796, including the balance brought forward. After deducting directors' fees, &c., it is necessary to fall back upon the reserve fund to the extent of £1,000, in order to pay a 5 per cent. dividend on the ordinary shares for the second half year in addition to the preference dividend for the year, carrying forward £359. There has been a severe reduction of dividend owing to the falling off of demand due to competition. The reserve fund now stands at £32,000.

YORKSHIRE (WEST RIDING) TRAMWAYS CO.—At the meeting on Friday, the report and accounts given in our last issue were adopted.

COUNTY OF DURHAM ELECTRICAL POWER DISTRIBUTION CO.—The report for 1908 shows net profits of £12,901, after meeting interest on loans and debenture stock. An interim dividend of 5 per cent. upon the preference shares was paid in October, and in view of the trade depression and consequent loss of revenue during the year, the directors have decided to transfer £6,500 to depreciation and reserve account, and carry forward the balance of £151. The total connections at the end of the year amounted to 29,336 h.p., an increase of 8,579 h.p. The main power transmission system is now complete, with the exception of the necessary cables to the Dunstan power station of the Newcastle Company, from which the supply for a large portion of the company's future load will be obtained. The meeting is on the 25th inst.

W. T. GLOVER & CO.—The report for 1908 shows a balance, including £5,576 brought forward, of £36,989. After transferring £2,500 to the first mortgage debenture redemption fund, a dividend of 5 per cent. is recommended upon the ordinary shares, carrying forward £11,062. The directors report that although there is a continued improvement in the financial position of the company, the cable industry is sharing the general depression of trade which is being experienced throughout the country.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.—The report for 1908 shows a profit, including £2,025 brought forward from 1907, of £75,087. After meeting interest on debentures, &c., the available balance is £49,148. A dividend of 5 per cent. is recommended upon the old preference shares, and a similar amount upon the new preference shares. A 2½ per cent. dividend is declared upon the ordinary shares, and after transferring £5,000 to depreciation account there is a carry forward of £2,736. The reserve account, after adding the premiums on shares sold during the year, stands at £36,989, and the directors have transferred from this £20,000 to depreciation account, which now stands at £83,500. The report shows that the revenue of the year has been seriously affected by strikes and the general trade depression, in addition to the high prices of coal. The directors put the loss under the former heading at £18,500 and the extra cost of coal at £17,500. No less than £37,000 has been expended during the year out of revenue on repairs and renewals. The Dunstan power station is expected to be in operation at the beginning of next year. The connections on December 31st amounted to 111,484 h.p., an increase of 18,720 h.p. for the year. The meeting is on the 25th inst.

BOURNEMOUTH & POOLE ELECTRICITY SUPPLY CO.—The report for 1908 shows a revenue of £33,587, after deducting working expenses and adding £938 brought forward from 1907. After meeting debenture stock, interest, and interim dividend paid in June there is a balance of £11,778, and the directors recommend a final dividend upon the 4½ per cent. and 6 per cent. preference shares and a 7 per cent. dividend upon the ordinary shares, leaving a balance of £913 to be carried forward. The applications received on December 31st amounted to 6,185 kw., an increase of 640 kw. for the year; and the number of units sold during the year was 3,005,714, an increase of 145,189. The meeting is to be held on 18th inst.

DIRECT SPANISH TELEGRAPH CO.—The report for 1908 shows a net balance of £10,087 after providing for interest on debentures and the preference dividends. After transferring £5,000 to reserve fund, a 4 per cent. dividend is recommended upon the ordinary shares, carrying forward £2,501. The meeting is to be held on 17th inst.

HASTINGS & DISTRICT ELECTRIC TRAMWAYS CO.—The report for 1908 shows a total available for dividends of

Digitized by Google

£19,435, and, after deducting debenture interest, &c., there is a net balance of £8,417. It is proposed to allocate £4,000 to depreciation, and to pay the arrears on the preference shares for 1906, namely, 2 per cent. The full preference dividend for 1907 has already been paid, but not that for 1908. The balance of £417 is carried forward.

PARLIAMENTARY INTELLIGENCE

PRIVATE BILL PROCEDURE.—The Anglo-Argentine Tramways Bill has been read a second time in the House of Lords.

The Gateshead and District Tramways Bill was read a second time in the House of Commons on Thursday.

The Folkestone, Sandgate & Hythe Tramways Bill was read a second time in the House of Commons on Monday.

The following Bills were read a second time in the House of Lords on Tuesday: County of Durham Electric Power Supply, Salford Corporation, and Manchester Corporation.

THE NEW TELEPHONE CHARGES.—In answer to a question in the House of Commons last week with regard to the alterations in the telephone charges involving the abolition of the "unlimited service" rate, the Postmaster-General stated that the consent of the Government was not necessary for this alteration by the National Telephone Company, since these rates did not come within the limits prescribed by the agreement of 1905. At the same time the Postmaster-General pointed out that the new "measured service" rate did not produce any immediate increase of charge except for new subscribers who were large users. The existing subscribers who were large users were still for the most part on the old flat rate system, whilst the new rate was distinctly advantageous to the smaller users.

STANDING ORDERS.—A number of borough councils having withheld their consent to tramways proposed in the London County Council Tramways Bill, the Examiners of the House of Commons have referred the matter to the Standing Orders Committee. The tramways concerned are in the east, north, and south-west. On Tuesday, the Standing Orders Committee decided that the Bill might proceed provided the proposed tramways in Paddington, Finsbury, Islington, Hackney, Putney, and Wandsworth are struck out.

THE NATIONAL TELEPHONE CO.—The Postmaster-General stated in the House of Commons on Monday that he is not yet in a position to make a statement as to the negotiations between the Post Office and the National Telephone Co. with regard to the continuance of capital expenditure, as the negotiations were not yet concluded.

NEW COMPANIES

TELEGRAPH AND TELEPHONE INSTRUMENTS.—This company was registered on January 30th, with a capital of £6,000 in £1 shares, to carry on the business of electricians, manufacturers of telegraphic and telephonic instruments, dynamos, and accumulators, &c., and to adopt agreements (1) with A. W. Sharman and others, (2) with W. Watson & Sons, Ltd., and (3) with L. H. Walter. Private company. Table "A" mainly applies. Registered by Baker, Baker & Co., 85 Gresham Street, E.C.

P. C. & H. SYNDICATE.—This company was registered on January 29th, with a capital of £12,000 in 10,000 ordinary shares of £1 each, and 40,000 deferred shares of 1s. each, to undertake the construction, establishment, maintenance, management, and working of any public or private tramway or light railway in any part of the world, &c. Private company. The number of directors is not to be less than two nor more than seven; the first are to be appointed by the subscribers. Remuneration as fixed by the company. Registered by Thys & Saunders, 79 Salisbury House, E.C.

PATENT TELEPHONE RECORDER CO. (CONTINENTAL).—Registered on Feb. 10th, with a capital of £1,000, to adopt an agreement with J. A. Gamble and C. F. A. Meger, and to carry on the business indicated by the title.

PHILAERIAN.—Registered on Feb. 10th, with a capital of £5,000, to carry on the business of manufacturers of and dealers in airships, flying machines, and motor vehicles and boats, electricians, electrical engineers, &c. Among the subscribers is Mr. M. Holroyd Smith, consulting engineer. Registered office: 9 Great St. Helens, E.C.

APPAREIL MAGNETIQUE.—Registered on Feb. 6th, with a capital of £500, to carry on the business of medical electricians and mechanicians, electrical masseurs, and therapeutists, manufacturers of and dealers in electrical and surgical appliances, &c.

VOSS & CO.—Registered on Feb. 11th, with a capital of £2,500, to acquire the business carried on at 14-15, New Yard, Great Queen Street, W.C., as "Voss & Co.," to adopt an agreement with E. Wilding and to carry on the business of electrical and mechanical engineers, scientific instrument makers, &c. Registered office: Dashwood House, 9 New Broad Street, E.C.

AUSTRALIAN ELECTRICAL CO.—Registered on Feb. 12th, with a capital of £100,000, to adopt an agreement with F. J. Healey and A. J. Roberts, and to carry on the business of electricians, mechanical engineers, suppliers of electricity for motive power, light, heat, or otherwise, manufacturers of and dealers in apparatus and machinery used in connection with the generation, distribution, supply, accumulation, and employment of electricity, &c. Registered office: 20 Copthall Avenue, E.C.

ADOS.—Registered on Feb. 12th, with a capital of £1,000, to carry on the business of electrical engineers and gas engineers, suppliers of electricity for light, heat, motive power and otherwise, &c. Registered office: Francis Court, Lincoln.

RUSSIAN PUBLIC WORKS & CONSTRUCTION CO.—Registered on Feb. 12th, with a capital of £10,000 in £1 shares, to carry on in Russia and elsewhere the business of financiers, bankers, contractors for the construction or working of railways, electrical works, tramways, canals, and gas and water systems &c. Registered office: 47 Victoria Street, E.C.

ROSSENDALE VALLEY TRAMWAYS CO.—Registered on Feb. 15th, as a re-incorporation under the Companies' Acts, 1862 to 1907, of a concern originally constituted by the Rossendale Valley Tramways Act, 1888. Capital £85,640 in £10 shares (8,000 ordinary and 564 preference). 5,000 ordinary and 564 preference shares had been taken up and paid for in full to Feb. 10th, 1909. Registered office:—61 Gracechurch Street, E.C.

STEEL WINGS WIND TURBINE CO.—Registered on Feb. 12th, with a capital of £5,000, to acquire patent No. 14,082 of 1906, for the United Kingdom in respect of an invention for an improved headframe for windmills, to develop same, and to carry on the business of suppliers of motive power for, or in connection with, electric lighting, water supply, traction, and other purposes, &c. Registered office:—St. Stephen's House, Victoria Embankment, Westminster.

HURST, NELSON & CO.—Registered in Edinburgh on Feb. 16th, with a capital of £320,000, to purchase the business of Hurst, Nelson & Co., Ltd., railway wagon builders and makers of railway plant, Glasgow, Motherwell, and elsewhere, and to carry on the business of builders, makers, and repairers of and dealers in railway, tramway, and road rolling stock, and permanent-way materials and plant, motor vehicles, railway, electric, gas, and tramway locomotives, iron masters, bridge and roof builders, engineers, &c. Registered office, the Glasgow Rolling Stock & Plant Works, Motherwell.

ELECTRICAL CONTRACTS & MAINTENANCE CO.—Registered on Feb. 26th, with a capital of £3,000, to adopt two agreements, the parties to which are not named, and to carry on the business of manufacturers of and dealers in apparatus and inventions connected with the production, storage, transmission or use of electricity or electric power as applied to lighting, telephones, telegraphs, fire alarms, and other means of electric communication, &c. Registered by Waterhouse & Co., 56 Cornhill, E.C.

DALZIEL'S CONSTANT VOLTAGE PATENTS.—Registered on March 4th, with a capital of £10,000, to acquire certain patents and interests in patents for inventions relating to electric lighting of trains and the automatic control of the voltage of electric apparatus. Registered by Jordan & Sons, Ltd., 116-117 Chancery Lane, W.C.

MICA SUPPLY CO.—Registered on March 3rd, with a capital of £3,000, to carry on the business of miners, growers, and producers of mica, asbestos, xylite, rubber, and other mineral or natural product used in connection with the insulation of electrical machinery, &c. Registered by Andrews, Fawcus, Ogilvie, & Fisher, 32 Essex Street, Strand, W.C.

THORIUM (METAL FILAMENT) LAMP WORKS.—Registered on March 4th, with a capital of £30,000, and to adopt an agreement with Merchants' Trading Co., Ltd., and to carry on the business of manufacturers of and dealers in metal filament and other electric lamps, electric lamp fittings, apparatus, and accessories, &c. Registered office, Broad Street House, New Broad Street, E.C.

NEW PUBLICATIONS

Telephone Charges.—In the report of the Telephone Committee of the Association of Chambers of Commerce, which has just concluded its forty-ninth annual meeting, it was stated that the Committee had found the Post Office authorities willing to meet them in suggesting a scheme for the withdrawal of the measured-rate system of charging, but that the directors of the National Telephone Co. would not consider the matter, and that consequently nothing could be done until the business was entirely in the hands of the Government.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 4th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

3,284/08. **Flywheel Load Equalising Sets.** BRITISH THOMSON-HOUSTON CO., LTD., T. E. ROBERTSON, and F. HOLDEN. Two arrangements are described. In the first, a motor-generator is mounted on the same shaft with a flywheel and an auxiliary machine with opposing shunt and series windings. The series winding and the armature of this machine are in series with the armature of the motor. When the load comes on, the auxiliary machine is caused to generate and to reduce the pressure across the motor terminals so that the speed of the whole set can drop, and the flywheel give up its energy, without the motor current increasing. In the alternative arrangement the auxiliary machine is mounted on a separate shaft with its own flywheel, and speeds up and reduces the pressure across the motor terminals when the load comes on, its series winding in this case being in series with the load. Nine claims, two figures.

3,388/08. **Joints between Tungsten Filaments and Leading-in Wires.** J. W. HOWELL. The end of the nickel wire is bent into a hook, and the end of the filament, previously coated with a paste of finely divided tungsten or copper mixed with gum arabic, is placed in the hook. An arc is drawn from the extreme end of the hook, and a globule of fused metal runs into the corner of the hook, fusing the paste and filament together. A portion of the coating above the joint is merely hardened, and appears to prevent the filament from breaking at the joint. The joint can also be made by heating the hook to a white heat. Four claims, four figures.

8,467/08. **Crane Gear.** A. JACK. This specification describes a gear-case for crane motors. Bearings for both the driving pinion and spur wheel are fixed in lateral extensions of the case, and an automatic mechanical brake is provided. The discs of the electromagnetic brake are inside the casing, which is filled with oil, but the coils of the magnet are outside. One claim, two figures.

12,009/08. **Mercury Motor Meter.** G. HOOKHAM. The mercury bath containing the copper disc is connected across a resistance which is in series with the correction coil and the main circuit, instead of the bath and coil being connected in series across the resistance. As an alternative, the correction coil can be split into two halves in parallel, one of which is in series with the mercury bath. Two claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Dynamos, Motors, and Transformers: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Single-phase motor] 27,849/07; MAVOR, and MAVOR & COULSON, LTD. [Hauling and winding gear] 1,450/08; GRAMMONT and ROUTIN [Servo-motor] 3,592/08; FAIRWEATHER (*Allmänna Svenska Elektriska Aktiebolaget*) [Polyphase induction machines] 4,113/08; ALLGEMEINE-ELEKTRICITÄTS GES. [Cooling of commutators] 21,761/08; AKT.-GES. BROWN, BOVERI, ET CIE. [Rolling mills and hauling plants] 27,152/08; JUSTICE (*Kiddle and Baumann*) [Generators] 27,236/08.

Electrometallurgy and Electrochemistry: USINE GENEVOISE DE DEGROSSISAGE D'OR [Electrolytic cells] 13,134/08; LUIZ [Electroplating] 21,243/08.

Ignition, Electric: ROBERT BOSCH [Carbon brush-holders] 23,362/08.

Incandescent Lamps: HOGE, and "Z." ELECTRIC LAMP MANUFACTURING CO. [Supports for filaments] 3,248/08; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Metal filaments] 25,557/08.

Instruments and Meters: MURPHY and KELVIN & JAMES WHITE, LTD. [Resetting pointers] 6,898/08.

Switchgear, Fuses, and Fittings: HARRISON [Starting switches] 6,370/08; CHARLES [Switch boxes] 6,501/08; ENGEL [Contact device] 6,765/08; HUBBELL [Socket switch] 13,863/08.

Telephony and Telegraphy: EISENSTEIN [Oscillation-generator for wireless telegraphy] 10,019/08; KITSEE [Telegraphy] 22,179/08.

Traction: UTTLEY [Signalling system] 3,581/08; MOUNTAIN & GIBSON, LTD., and TOLKIEN [Track-brake] 4,021/08; WAGNER [Trackless vehicle] 4,637/08; GRAY [Overhead points or frogs] 7,944/08; BOULT (*Union Switch & Signal Co.*) [Signalling system] 9,851/08 and 12,179/08; WARD [Tramcar trolleys] 11,575/08; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Air brakes] 12,683/08; ROBINS [Brakes] 13,606/08; NOEL [Brakes] 23,155/08.

Miscellaneous: WALKER [Heating radiator] 3,028/08; MACKENZIE (*Shepherd*) [Fire alarm system] 3,653/08; GOODWIN and BURGESS [Ozone generator] 5,502/08; KOSCH [Heating apparatus] 8,412/08; DEAN [Interrupter for induction coils] 9,930/08; JEROME [Vibrators] 16,819/08; GIN [Gassing or thread-singeing machine] 17,223/08; WHITTINGTON [Cartridges for electrically fired arms] 19,620/08; MANNY and BINZEL [Selective signalling devices] 22,439/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

CÔTE and PIERRON [Electric furnace] 18,653/08; SIEMENS & HALSKE AKT.-GES. [Tungsten filaments] 2,853/09; BRONÉE [Printing telegraph] 3,340/09.

Opposition to Grant of Patents

Opposition to grant on the following applications has been entered.

3,626/08. **Motor-Generator.** CROMPTON & CO., LTD., J. C. MACFARLANE, and H. BURGE. This relates to a motor-generator set for supplying an approximately constant current to the secondary circuit at a varying pressure. The motor and generator armatures are connected in series across the primary mains, and each machine has a shunt winding connected across its armature. The generator has an additional shunt winding connected across the primary mains. Each machine has a series winding; this assists the shunt winding in the case of the motor, and opposes in the case of the generator. The secondary circuit is connected across the generator armature, and the two series windings, and can be short-circuited without the current rising to an excessive amount.

4,956/08. **Manufacture of Metal Filaments.** F. J. PLANCHON. An abstract of this specification, which describes a process for the preparation of a plastic tungsten compound for squirting into filaments, was given in ELECTRICAL ENGINEERING, January 14th, 1909, page 51.

Expiring and Expired Patents

The following patents expire during the current week after a life of fourteen years:—

5,254 of March 12th, 1895. **"Uralite" Fireproof Insulating Material.** A. IMSCHENETZKY. This patent is for the process of manufacturing Uralite, which consists of asbestos fibre cemented together with silica. The porosity of the material is destroyed by adding powdered rosin or some other suitable substance.

5,279 of March 12th, 1895. **Fire Alarm System.** F. E. STUART. Distinctive signals are used to avoid false alarms.

5,331 of March 13th, 1895. **Meter.** J. DEVONSHIRE of the BRITISH THOMSON-HOUSTON CO., LTD. (*W. C. Fish*). The armature of this meter is connected across the mains, and rotates in the field produced by a fraction of a turn in series with the main circuit. A construction is described in which the main conductor is U-shaped, and supports the whole mechanism of the meter.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, Motors, and Transformers: BRITISH THOMSON-HOUSTON CO., LTD. (*A. H. Armstrong*) [Phase transformer for regulating polyphase motors] 25,904/96; BRITISH THOMSON-HOUSTON CO., LTD. (*General Electric Co., U.S.A.*) [A.C. repulsion motor] 24,799/03.

Electrometallurgy and Electrochemistry: D. R. S. GALBRAITH and W. STEWART [Furnace] 25,032/03 and 25,033/03.

Ignition, Electric: F. J. ARNAUD, 23,186/03.

Instruments and Meters: P. M. JUSTICE (*The Veeder Manufacturing Co., U.S.A.*) [Revolution counters] 24,181/98; BRITISH THOMSON-HOUSTON CO., LTD., and R. C. CLINKER [Phase indicators for synchronising] 25,151/02; W. L. CASE and REASON MANUFACTURING CO., LTD. [Maximum demand indicator] 25,074/03; J. ALLAN [Prepayment meter] 25,114/03.

Switchgear, Fuses, and Fittings: W. R. LAIDLAW [Lamp-holder attachment for gripping flexible] 24,986/02; G. LAIRD and J. P. TODD [Motor controller] 25,146/03.

Telephony and Telegraphy: F. H. W. HIGGINS [Type-printing telegraph] 25,644/96.

Traction: W. A. HEINDLE [Supporting conductor in conduit system] 23,047/01; A. H. GAWTHORP [Destination indicators for tramcars] 23,283/01; T. C. BUDER [Trolley poles and heads] 25,342/02; W. C. MITCHELL and M. CUMMINS [Brake gear] 25,520/02; C. DE KANDO [Collector bow for high speeds] 25,554/02; BRITISH THOMSON-HOUSTON CO., LTD. (*General Electric Co., U.S.A.*) [Air brakes] 24,793/03 and 24,796/03, and [Electric braking with A.-C. repulsion motors] 24,800/03; M. G. WAGGOT, M. ROSENBERG, and W. SMITH [Surface contact and automatic signalling system] 24,847/03.

Miscellaneous: CENTRAL CYCLONE CO., LTD., (*J. C. Jessop*) [Electrically controlled mechanical stoker] 20,807/00; F. A. CHANDLER and B. BONNIKSEN [Electric clocks] 24,864/03.

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** *weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.*

SUMMARY

MR. S. G. Brown, in a lecture at last Friday evening's meeting of the Royal Institution, explained the limitations which exist in the carrying capacity of submarine cables and the means adopted to extend them. (Page 252.)

A CIRCULAR has been issued to its construction staff by the National Telephone Co., in which it is hinted that the negotiations with the Postmaster-General providing for the continuance of capital expenditure for the requirements of years beyond the expiry of the company's licence have not been successful, and that the dismissal of a large number of the construction staff will have to take place. (Page 252.)

A NEW telephone exchange with central battery equipment will be opened very shortly in Manchester by the National Telephone Co., and a considerable number of subscribers' lines will be changed over from the older central exchange, which is equipped on the call key system. The general arrangement of the new exchange follows the latest standard C.B. practice of the company, with the addition of a new lamp-flashing circuit on the trunk positions. (Page 253.)

A NEW trunk telephone exchange has been opened at Liverpool with 42 trunk and junction sections. (Page 254.)

A PAPER on the self-demagnetising factor of bar magnets was read by Prof. Silvanus Thompson and Mr. E. W. Moss before a recent meeting of the Physical Society. (Page 256.)

THE hearing of the appeal by the British Westinghouse Co. against the decision of the Comptroller-General of Patents to revoke the Bremer flame arc lamp patent was commenced on Wednesday, March 10th. The Westinghouse Co. have abandoned the argument that the lamps were manufactured in this country to an adequate extent to meet the demand, but assert that they have satisfactory reasons, the chief of which is that the period of a licence granted to another firm is not yet terminated, for not manufacturing to a larger extent. The respondents assert that this very agreement shows that the Westinghouse Co. never intended to manufacture the lamps to any con-

Digitized by Google

siderable degree in this country. The proceedings have been suspended for a few weeks in order to enable the Westinghouse Co. to put in further evidence. (Page 255.)

THE Paper read before the Institution of Electrical Engineers on Thursday by Mr. E. A. Watson consisted mainly of a description of a series of experiments on the dielectric strength of compressed air and the effect of the shape of the electrodes on the sparking distance. The dielectric strength was found to increase approximately proportional to the pressure of the air, and between pressures of 10 and 15 atmospheres reached values equal to those for ordinary solid or liquid dielectrics. The author exhibited an electrostatic voltmeter, the moving parts of which were enclosed in a vessel of gas under pressure. In the discussion which followed, the practical application of the results to wireless telegraph apparatus was referred to, and some interesting points relating to condensers for high pressures were brought out. (Page 257.)

MR. A. M. Taylor, in a Paper read before the Birmingham Section of the Institution of Electrical Engineers last week, put in a plea for the employment of batteries on large power schemes and transmission lines, and argued that great savings in cost of mains and lines would result. (Page 259.)

IN a Paper by Messrs. J. G. and R. G. Cunliffe, read before the Manchester Section of the Institution of Electrical Engineers last week, experiments were described which showed that in ordinary circumstances there is no possible electrolytic danger to any pipe within 3 ft. of the rails. Mr. A. P. Trotter, in the discussion, said that there had been no case of electrolytic damage to pipes when the Board of Trade Regulations had been complied with. (Page 261.)

MENTION is made under Electrometallurgy and Electrochemistry of the 15-ton Heroult electric furnaces which are to be put down by the United States Steel Corporation. A note is also given on the manufacture of calcium carbide in Japan. (Page 262.)

THE text of a Bill amending the Electric Lighting Acts has been issued, which is substantially identical with the "Supply of Electricity Bill" introduced by the Board of Trade for several sessions prior to 1904. The purport of the Bill is to remove the difficulties which have been experienced in the working of the Electric Lighting Acts of 1882 and 1888 and the Electric Lighting (Clauses) Act, 1899. (Page 263.)

A NEW switch with a time attachment for staircase lighting, some electromagnets for lifting purposes, and a new starting switch for small A.C. motors, are described in short articles on pages 263 and 269.

A PROPOSAL is before the Acton Council for leasing their electricity undertaking to the Metropolitan Electric Supply Company for 37 years.—An expert is to be called in to inspect and report upon the tramway track at Cardiff.—The Colchester Corporation is supplying an outlying district with electrical energy from the tramway wires.—The Sub-Committee of the Dundee Corporation again recommend the installation of the trackless trolley system along the Esplanade.—The electricity accounts of the West Ham Corporation will show a net surplus of £3,000 for the year ending March 31st.—The financial position of the Swindon Corporation Electricity Works is to be the subject of a special inquiry. (Page 264.)

CONSIDERABLE extensions are contemplated to the generating plant of the Fife Electric Power Company; a scheme of mains involving an expenditure of £2,000 is to be carried through at Belfast; and the sum of £9,726 is to be spent upon an electric power plant at the Bradford Technical College. Electrical stores are required at Bolton, Bristol, and other places. Schemes for the illumination of the Parade at Bridlington are asked for. (Page 265.)

IT is announced that an offer has been made to the Swansea Corporation by a strong syndicate for the purchase of the municipal electric supply undertaking. (Page 269.)

AMONGST the specifications published by the Patent Office on Thursday was one by H. Hoge and the "Z" Electric Lamp Manufacturing Co., Ltd., for a support for metal filaments, which consists of a crown of resilient wires rising from an insulating base into which the ends of the filaments are cemented. The British Thomson-Houston Co., Ltd., have one for a process of manufacturing tungsten filaments, and a method of exciting the synchronous motor of a Leonard motor-generator combination for variable loads is described in a specification by Brown, Boveri & Cie., Akt.-Ges. Five patents relating to electrical subjects expire during the current week; of these, one is for an electromagnetic clutch, and another is for a process for manufacturing insulating sheets out of overlapping mica scales and gutta-percha. Classified lists of the specifications published to-day, and of some of the more important patents which have been dropped, are also given. (Page 272.)

THE report of the London United Tramways Co. for 1908 states that no dividend can be paid upon the ordinary shares, and only 2½ per cent. on account of the 5 per cent. preference shares. The accounts of the Smithfield Markets Electric Supply Co. for 1908 show gross profits of £1,988, and no dividends are declared. The accounts of the South London Electric Supply Corporation show net profits of £14,770, and 5 per cent. is declared upon the ordinary shares. A dividend of 10 per cent. for the year is recommended by the British Insulated and Helsby Cables; the net profits amounted to £81,000.

Two facts were elicited from the Paper and discussion at the last meeting of the Manchester Section of the Institution of Electrical Engineers: first, that there have been no cases of electrolytic damages to gas and water papes by the earth-return currents from tramway systems except when the Board of Trade Regulations have been disregarded; and, secondly, that no pipe more than 3 ft. distant from the rails is liable to damage, even if the seven-volt permissible drop of pressure in the rails is exceeded. On the other hand, cases of damaged pipes in the United States, and of damaged cables in this country, show that the factor of safety in the Regulations is not too great, as was hinted by Mr. Peck, and we should be sorry to see them relaxed. The saving in cost of negative feeders and boosters, if a larger drop in the rails were allowed, would be by no means proportionate to the increased risk of damage to the networks of gas and water pipes in our cities. Nor do we think that any case has been made out for any alteration in the practice of having the rail return connected to the negative and not the positive 'bus bar, and the suggestion made by the brothers Cunliffe, the authors of the Paper, that the bonding of rails to pipes should be abandoned, must not either be acted upon. Practice shows that it is advisable in certain cases to connect the rails to the pipes when these come too near together. If this occurs in a place where the pipes are distinctly positive to the rails, there will be a strong tendency for the current to pass from the former *via* the earth to the latter, and it is advisable to provide a metallic path even if the current is thereby

Digitized by Google

increased, and, as was pointed out by Mr. Trotter, the theoretical case which apparently dictates otherwise assumes strict parallelism between the pipes and the rails, a condition which does not arise in practice.

In 1901 the Institution of Electrical Engineers appointed an Electrical Legislative Committee, and as the result of its deliberations a deputation waited upon the then President of the Board of Trade, Mr. Gerald Balfour, to point out how the electric supply industry had advanced in directions never anticipated when the Acts of Parliament under which it had been working for some twenty years were framed. It was then demonstrated that the needs of the industry, expanding rapidly as it was each year, demanded a radical change in the legislation governing it, an argument which was so far convincing that a Bill called the Supply of Electricity Bill was shortly afterwards introduced into Parliament by the Board of Trade. This Bill sought to remove the many anomalies which had come into existence; but in spite of the obvious necessity for the measure and the fact that it became non-contentious, it never proceeded further than the House in which it was introduced, although it was brought forward during several succeeding sessions. This week, however, there was published the Electric Lighting Acts (Amendments) Bill, which is substantially the same Bill with some additional clauses, and it is to be hoped that this will meet with a greater success than its predecessor. The Bill gives to the Board of Trade power to grant provisional orders for many purposes where it is now necessary to proceed by private Bill. Owing to the delay in this amendment of the Electric Lighting Acts, quite a large number of supply authorities have been compelled to seek the very facilities granted by this Bill in the form of clauses in private Bills of their own. Nevertheless, the Bill will be of the greatest utility and value to the electric supply industry, as a perusal of its clauses will show. The absurdity of the illegality of "association" between neighbouring supply authorities disappears for ever, although so far as London is concerned this matter was dealt with in the London Electric Supply Act of 1908. Thus also in the case of wiring of premises, &c., by municipalities, powers were granted to the London boroughs (although several already had such powers) under an L.C.C. Act of 1906; but the Bill now introduced gives similar powers as a matter of general legislation throughout the United Kingdom. Bulk supply in neighbouring areas, the supply to tramways and railways running through several districts, and the exercise of powers by a combination of local authorities are all now placed within the jurisdiction of the Board of Trade. The clause exempting agreements for power supply from stamp duty assumes some considerable importance in view of the action recently taken against the County of Durham Electrical Power Distribution Co., Ltd., in which the Commissioners of Inland Revenue sought and obtained a decision of the Courts that such agreements were subject to a duty of 2s. 6d. per £100. The Bill, as a whole, is one which has been urged upon the Board of Trade year after year, and now that the Government have seen their way to allow it to be introduced we trust that the necessary facilities will be granted for it to become law.

ARRANGEMENTS FOR THE WEEK

FRIDAY, MARCH 19TH.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. Meeting at 207 Bath Street. Paper to be read:—"Notes on Safety of Working Electrical Plants in Coal Mines," by S. A. Simon.

Royal Institution.

9 p.m. Evening Discourse by Prof. R. Threlfall, F.R.S., on "Experiments at High Temperatures and Pressures."

SATURDAY, MARCH 20TH.

Electrical Football League.

3.30 p.m. The following matches will be played this afternoon:—Ediswan *v.* St. James's; Robertson's *v.* County of London.

"Robertson" and "Osram" Electric Lamp Works.

7 p.m. Staff Annual Dinner at the Clarendon Hotel, Hammersmith Broadway.

MONDAY, MARCH 22ND.

Royal Society of Arts.

8 p.m. Cantor Lecture I., on "Steam Turbines," by G. G. Stoney.

TUESDAY, MARCH 23RD.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. Annual General Meeting at the University.

WEDNESDAY, MARCH 24TH.

Institution of Electrical Engineers: Leeds Section.

The meeting arranged for this evening has been postponed.

THURSDAY, MARCH 25TH.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster, London. Paper to be read:—"The Electrical System of the London County Council," by J. H. Rider.

FRIDAY, MARCH 26TH.

Physical Society.

5 p.m. Meeting at the Imperial College of Science, Imperial Institute Road, South Kensington. Among the Papers down for reading are the following:—(1) "Note on the Production of Steady Electric Oscillations in Closed Circuits and a Method of Testing Radiotelegraphic Receivers," by Prof. J. A. Fleming, F.R.S., and G. B. Dyke. (2) "The Effect of an Air Blast upon the Spark Discharge of a Condenser charged by an Induction Coil or Transformer," by Prof. J. A. Fleming and H. W. Richardson.

Electro Harmonic Society.

8 p.m. Last Smoking Concert of the season, at the Holborn Restaurant.

SATURDAY, MARCH 27TH.

Junior Institution of Engineers.

3 p.m. Visit to the single-phase railway installation of the London, Brighton & South Coast Railway Co.

Wireless Telegraphy and Telephony.—According to the *Standard*, a wireless station with a range of 1,800 miles will be erected shortly in Grand Canary, Canary Islands, and other smaller stations will also be installed for intercommunication amongst the islands. The contract for the installations has been given to a French company. It has been decided in America to postpone the consideration of compulsory wireless legislation until the next winter session of Congress. The ships of the Royal Mail Steam Packet Co. engaged in the Brazil and River Plate mail service are to be fitted with wireless apparatus by the Marconi Co. Apparatus on the De Forest system is already installed on those ships on the West Indian-New York service. A company, under the name of the Wireless Company of America, with a capital of $10,000,000, is being organised by Brooklyn and New York capitalists. The cable between Guernsey and Jersey being interrupted, messages are being transmitted from Guernsey to Jersey, a distance of forty miles, by wireless without any extra charge.

Strike of Paris Telegraph Operators.—A series of disturbances amongst the telegraph operators at the Central Offices in Paris have taken place within the last few days, and have resulted in serious delay to the telegraph traffic. Several grievances have been put forward by the operators, but no demand for higher wages has been made. On Friday evening there was a serious disturbance in the main operating room at the Central Telegraph Offices, and of the forty employees who were arrested, eight have been sentenced to six days' imprisonment for acts of violence. Although the agitation still continues, the work at the Central Offices was only interrupted for a few hours on Saturday and Monday. Thirty-eight telegraph operators and post-office clerks have been suspended temporarily from the service. These drastic measures have apparently prevented a general strike, but it is impossible to know exactly what to expect. It is stated that two hundred operators from the Army have been brought up to Paris to be at hand in any emergency. According to the latest dispatches, the work at the Paris Central Offices is still seriously disorganised, and a general strike is said to have been proclaimed at Lyons.

SUBMARINE TELEGRAPHY

THE Friday evening discourse last week at the Royal Institution was given by Mr. S. G. Brown, and was entitled "Modern Submarine Telegraphy." The lecturer commenced by recapitulating the essentials of a submarine telegraph cable, the gutta-percha covered copper core, and the further coverings of jute and armouring, and outlined the laws upon which the transmission of cable signals depends. He explained how the time rate of signalling of any particular core was inversely proportional to the product of the capacity and the resistance—the well-known "K R." law, first enunciated by Lord Kelvin—and said that the theoretical critical relative value of these constants gave a ratio of copper to gutta-percha diameter of 1·0 to 1·65. A drawing was shown of a section of such an ideal cable compared with one of the best Atlantic cables (laid in 1894). Unfortunately the large copper section and small amount of gutta-percha called for by the electrically ideal cable introduced practical difficulties. The ideal cable would have a K.R. of 2·06 and a carrying capacity, under duplex conditions, with a 40-volt battery of 240 letters or even more per minute. In the actual 1894 cable the K R. was 2·4, which gave a carrying capacity of only 205 letters per minute. Mr. Brown was, however, of opinion that the use of impregnated cotton for the cores might lead to some improvement.

The effects of resistance in producing attenuation of signals and of the electrostatic charge due to the capacity of the cable were then explained by the aid of simple analogies. Heaviside had pointed out how inductances would improve the speed of signalling, and the lecturer emphasised this point and also the effect of leakance by tables and curves. Unfortunately, however, no practical means of providing the desirable distributed inductance along a submarine cable had been devised, so that it was at present unavoidable that the current waves should suffer considerable distortion. Reproductions of curves from syphon recorders and other instruments, including the lecturer's own drum-cable relay, were shown to illustrate this, and it was pointed out how a complication arose through the attenuation varying with different forms of signals, as they practically amounted to different frequencies. The matter was dealt with by Cromwell Varley in 1862 by the use of series condensers. The effect of this, however, varied according to the frequency, with the result that although the distortion was reduced, the attenuation was added to. The phase relation between the voltage and current waves also varied in amount with the different frequencies. Some improvement was effected in 1899 by the application of an inductance shunt to short-circuit the swinging coil of the syphon recorder instead of the series condenser, but when working with the cable relay the condenser was usually retained. Series inductances, particularly at the sending end, increase the speed of signalling and reduce the effect of what is known as jarring in duplex working.

A number of slides illustrating various incidents in cable-laying were then shown, and then the lecturer passed on to a brief consideration of duplex working which was now applied to practically all cables to enable simultaneous signalling in either direction to be carried out. Diagrams were shown to demonstrate the way in which the sending current was divided between the balanced arms of a Wheatstone bridge arrangement, containing the actual cable, and an "artificial" circuit of like electrical properties, so that the receiving instrument at the sending end was not affected. A cleverly contrived model illustrated the action by mechanical analogy. Duplexing a cable reduced the one-way speed by about 20 per cent., but the total carrying capacity was increased by about 70 per cent.

Before the actual instruments used in cable signalling were described, a few lantern slides were shown of the interiors of cable stations in various parts of the world. Considering first the sending end, it was pointed out that the speed of sending with hand keys is limited to about 140 letters per minute, and that automatic transmission, in which the message is first printed on a paper strip, afterwards passed rapidly through the transmitter, was now practically universal. The construction of the automatic sender was explained, and attention was drawn to the way in which the cable is put to earth immediately after each current impulse to hasten its discharge. This effect had been carried further in the "curb" transmitter by sending a slight reverse current impulse after each signal, but the use of the curb transmitter is now practically abandoned, owing to the great strain placed on the sending end of the cable and the much greater disturbance caused in duplex working. Turning to receiving instruments, the lecturer spoke of the famous syphon recorder designed by Lord Kelvin in 1867, and of the drum-cable relay which had been the result of his own experiments. This apparatus, in addition to enabling clearer signals to be received at high speeds, can be employed to work various other instruments, through further relay and local circuits, such as punching machines, in which the signals can be automatically punched on a paper strip for further transmission. A complete set of these instruments was shown in action. Considerable difficulties arose in the design of the cable relay, principally on account of the feebleness of the currents received, which was not found sufficient to exert the forces required to make and work ordinary contacts. Difficulties were also introduced by the lack of sharp definition of the signals and the wandering of the zero. Means, however, have been found to overcome most of these troubles. The principal features of the Brown cable relay were given in Electrical Engineering, Vol. I., page 250, where the patent specification concerning the apparatus was published. The apparatus consists essentially of a moving coil receiver similar to the syphon recorder, the coil of which carries a long light pointer. The end of this pointer moves over the surface of a rotating drum upon which it presses very lightly. The middle part of the surface of the drum, upon which the pointer rests in the zero position, is made of insulating material, and on both sides are metal surfaces with which the pointer makes contact when deflected. The rotation of the drum minimises friction, and condensers short-circuiting the contacts prevent deleterious effects of the minute sparking that might occur. An inductive shunt in parallel with the suspended coil improves the sharpness of the signals, and a most ingeniously arranged local correction circuit to a great extent obviates the wandering zero by causing correcting currents sensibly proportional to the disturbing earth currents to pass through a second winding of the suspended coil. These and other refinements have enabled a considerable increase in signalling speeds to be obtained. In some recent experiments on the Eastern Telegraph Company's cable from Porthcurno (Cornwall) to Gibraltar, the ordinary speed of 140 letters per minute was increased to 230 to 240 letters per minute under ordinary duplex traffic conditions, and by special arrangements a speed of 280 letters per minute was reached. Another advantage of the Brown relay system over the ordinary syphon recorder is that considerably less attention is required. In the latest high-speed form of relay an arrangement is added in virtue of which a local battery provides currents which intensify the more rapid signals and make the action of the relay more definite.

NATIONAL TELEPHONE CO.'S EMPLOYEES

AT the annual meeting of the National Telephone Company it was stated that negotiations were in progress with the Postmaster-General with a view to preventing the discontinuance of capital expenditure during the remaining years of the company's lease, and last week, in the House of Commons, the Postmaster-General, replying to a question on this subject, stated that the negotiations were still proceeding, but that it would be inexpedient to make any statement in the meantime. The company's position, of course, is that, being purchasable in 1911 upon what may be called tramway terms, namely, the value of its plant, without any consideration for future profits or goodwill, it would be uncommercial on their part to incur capital expenditure during the remaining three years of its existence except upon works which will bring in revenue adequate to the expenditure. In other words, capital will not be expended except with the co-operation of the Government upon works of the nature of future requirements.

Whilst the statement at the annual meeting of the company and the reply of the Postmaster-General last week encouraged the belief that the negotiations for the continuance of capital expenditure upon the old lines would be successful, a circular issued to the employees of the company and signed by the president points distinctly in the other direction. In this it is stated that unless some arrangement is come to with the Postmaster-General to bridge over the present artificial position, there must be a great decrease in the company's capital expenditure during the remaining period of the license, and the consequence of this would be a reduction in the construction staff. The circular points that the company has already drawn the attention of the Postmaster-General to the grave evils arising from the position in not making adequate provision for the telephonic requirements of 1912 and subsequent years, but that unfortunately up to the present no solution to the difficulty has been found. This communication is apparently taken by the construction staff to mean that the dismissals, which were stopped last year, will shortly recommence.

In the meantime, attention may be drawn to a question and answer in the House of Commons on Thursday, in which the Postmaster-General was asked whether he had now come to an arrangement with the National Telephone Company as to the provision of plant for new services, and if he was aware that inconvenience was being caused in Edinburgh owing to the lack of facilities for new subscribers. The Postmaster-General replied that the negotiations with the National Telephone Company have in view the continuance of general construction works involving the provision of spare plant for use after 1911. The company were, he understood, prepared to provide plant for all requirements of the services up to the end of that year, when their license expired. He had not received any complaint as to insufficient telephone facilities at Edinburgh until that day, and he was communicating with the company.

THE MANCHESTER "CITY" TELEPHONE EXCHANGE

A NEW telephone exchange will be opened by the National Telephone Company in Manchester very shortly. This exchange, which will be called the City exchange, is situated at the corner of York Street and George Street, and is a large red brick four-floor building. The exchange starts with about 300 subscribers, most of whom have been changed over from the Manchester "Central" exchange, which is now practically full. As new subscribers join in the city area, they will be connected to the new exchange, and about 3,500 lines in all will also be transferred from the central exchange about Whitsuntide. The new exchange has an answering equipment of 6,000, and a multiple of 6,600; the ultimate capacity of the multiple is 10,500. The reason of the large difference between the multiple and the answering equipment is that in the case of party lines there are two jacks per party line as in the Birmingham "Midland" Exchange (described in ELECTRICAL ENGINEERING of March 4th), and, of course, there is also a provision of spares.

An interesting point in connection with the opening of the City Exchange is that it inaugurates a change of system at Manchester. The Central Exchange at Manchester had one of the original flat switchboards on the call wire system. So much trouble was experienced with the call wire system for subscribers, that this was modified to what is known as the call key system, in which the subscriber presses a key to call the exchange and to ring off, but does not make use of a common call wire. New subscribers connected to the City exchange will now be on the ordinary central battery system.

There are no overhead wires entering the exchange. Manchester was one of the first cities in this country in which the National Telephone Co. introduced an extensive underground system, using overhead lines only, for connecting up subscribers to distributing centres. Moreover, as there are numerous large office buildings in the city divided up into a number of offices, the distributing wires can frequently be run internally. The cables enter the sub-basement partly in cement and partly in fibre ducts laid in cement. In the sub-basement there are also two sets of three-wire 2 × 200 volts cables leading in from the Corporation Electricity Supply system. They are connected to different distributors, and there is a change-over set so that the connections can be switched over in the event of a breakdown of the mains. 400 volts is used for the motor-generators, and 200 volts for the lighting.

It may here be mentioned that the lighting of the exchange was carried out by the Manchester firm of Messrs. L. E. Wilson & Co. It is on the ordinary concealed conduit system, with solid-drawn steel tubes laid in the walls and floors. The cables are taken to each floor from a main switchboard. The lighting of the switchboards is carried out by lamps in reflectors on the usual system employed, and the remainder of the lighting is chiefly by means of pendants which are hung on ordinary flexible in the switch room, and workshop flexible in the apparatus room.

The basement, ground floor, and part of the first floor are let as offices, and the remainder of the first floor is used for the schools, service testing rooms, and the male staff lavatories. On the second floor of the building are the company's district offices, which occupy a considerable amount of space, and the apparatus room.

The usual practice is followed with regard to the main frame and intermediate distributing frame, &c. An eleven-cell Chloride battery has been provided, but in this instance the practice of only putting in a few plates and filling up the cell with displacement boxes has not been followed. The main battery has 34 positive plates and a capacity of 5,778 ampere-hours at the nine-hour discharge rate; the ultimate capacity is 6,120 at the same discharge rate, with 36 positive plates. At the terminal cell there is a heavy 1 in. copper bar, round which the lead is sweated, and heavy copper lugs into which the cables are sweated are fixed on to this. The extra four-cell battery for the registers and for supplying current to private branch exchanges has at present six positive plates, and will ultimately hold 10. The present capacity is 1,017 ampere-hours at the nine-hour rate, and its ultimate capacity 1,701 ampere-hours at the same discharge rate.

Another feature of the power equipment is that the motor-generators run at a slow speed to avoid any risk of vibration being felt in the offices beneath. They are six-pole machines running at 475 r.p.m., and have the usual commutators with many segments. There are two machines, each of which is capable of supplying 1,000 amperes at 30 volts, or 700 amperes at 38 volts, the higher voltage being, of course, required for charging the extra four cells in series with the main central battery. A 300-watt dynamotor is run from the battery for ringing and tone tests, and there is also a motor-generator with the same output run off the supply mains.

On the top floor of the building are the operators' quarters, and the switch-room. In all, 24 subscribers' or A sections, and 10 in-coming junction or B sections, have been erected, the latter including nine trunk positions. Each of the A sections is equipped with 260 local jacks for three operators' positions, and there are 30 out-going order wires per position. There is also a multiple of 700 out-going junctions on the A boards, and 120 out-going junction jacks on the B boards used for service lines and subscribers having special lines for trunk service. Both the A and B boards have the standard Western Electric Company's equipment, this firm having been responsible for the supply of the entire equipment of the exchange. The keyboards on the subscribers' section have 17-cord circuits per operator, and on the B section 27-cord circuits.

As already mentioned, the same arrangement of the party lines is used as in the Birmingham Midland Exchange, but there is an innovation in the arrangement of the lamp-flashing circuit on the trunk positions. On each of these there are 24 ordinary junction cords, and three lamp-flashing cords. In the ordinary arrangement for using these, when the operator was asked for a number on the order wire and found that was engaged, she had to plug in with the junction plug and ask if the subscriber would take the trunk call. If he replied in the affirmative, she had then to remove this plug and put in the lamp-flashing plug, so as to give a flashing signal on the supervisory lamp of the cord on the subscribers' board where the local connection was made. When the A operator saw this signal she would, of course, clear her plugs, and the junction operator would see the clear on her supervisory lamp. She would then have to change the plugs again, taking out the flashing plug and insert the junction plug to complete the connection. This is now simplified by adding a break-jack in each of the trunk junction cords. To give the flashing signal the junction operator has now merely to insert the flashing plug in this break-jack, and remove it when she gets the "clear" on her supervisory lamp.

In all the cases where there are several order wire keys from an A position to one exchange, the top of one of these is white, and the operator has to give

Digitized by Google

this key the "first choice" when asking for a junction line. This facilitates and accelerates even distribution of the traffic on the order wires, and has been used in many of the recent exchanges of the National Telephone Co.

All the local cords have steel wires instead of tinsel, and the back of the board is arranged with fireproof slides shutting off the cords from the cabling.

A very complete system of fire alarms is provided. At the back of the switchboard emergency contacts are connected to chains, and there are also emergency pushes in the apparatus room offices, and also in the offices occupied by the tenants. The latter pushes are protected with mica covers. On one of these being actuated, hooters sound to warn the emergency staff, and a lamp glows on each of four lamp boards—one in the switch-room, one in the district offices, and two in the apparatus room. The staff who are not on the special emergency staff go on with their work, but if the fire gets out of control, or if there is danger of a serious conflagration, a "clear out" push is depressed, which gives the signal for a general exodus.

Synchronome clocks are used throughout the building.

We are indebted to Mr. F. Gill, Engineer-in-Chief to the National Telephone Co., and the District Manager, for permission to view the exchange, and also to Mr. Hughes, engineer of the Telephone Co.'s construction staff, for his courtesy in showing us over the exchange.

Birmingham and District Electric Club.—A Paper was read by Mr. J. A. Jeckell last Saturday on reducing costs of power in works and factories. The author pointed out how important it was, especially at times when trade is bad, to reduce standing charges to a minimum, and proceed to investigate the direction in which economies can be looked for in the arrangement and management of steam plant. The importance of coal testing was emphasised and the prevention of scale in boilers was considered, as well as the separation of grease from feed water. The proper proportioning and designing of air-way to get the best results out of mechanical stoking was spoken of, and various minor causes of waste were dwelt upon. Important savings could also be obtained in many works originally steam driven by even the partial adoption of electric driving. It might pay, for instance, to drive one part of the works by electric motors supplied with current from the town mains, and drive the rest of the works with a steam-engine non-condensing, the exhaust steam being used in winter to heat the shops, in summer to heat the feed water to boilers by means of a feed-water heater.

Electric Power and Smoke Abatement.—At the second conference of local authorities, held in Sheffield, in connection with the Smoke Abatement Exhibition, Mr. S. E. Fedden, manager of the Sheffield Electricity Supply Department, read a Paper, in which he emphasised the reduction in the amount of fuel smoke occasioned by the now almost universal distribution of electrical energy for power purposes. Sheffield ranked fourth in the kingdom with regard to the magnitude of its power load, but nowhere was there a better field for increase. In the new turbine station at Neepsend (Electrical Engineering, Vol. I., page 1030) the coal consumption worked out at less than 2 lbs. per h.p., or, say, 2½ to 3 lbs. per h.p., delivered to the consumer, whereas the amount consumed in the average steam-driven factory was about 10 lbs. per h.p. Again, the coal in a central station was consumed under conditions favouring more perfect combustion, and consequently less smoke productions. There was, he thought, a great future for electrical furnaces for metallurgical operations, and in time electricity might be applied generally to domestic heating. Other Papers dealt with the calorific value of fuels and the supply of coal to specification; the duties and difficulties of local authorities in abating smoke nuisances; and the relative amount of sunshine in the large towns of the United Kingdom. In this last Paper it was stated that Sheffield came top out of the manufacturing towns with 1,395 hours of sunshine per annum out of a possible 4,000, or 35 per cent. London had 33 per cent. and Manchester only 25 per cent. It was decided at the meeting to form a committee of local authorities, manufacturers, and others to consider the question of smoke abatement. We are informed that a stand at the above-mentioned exhibition was acquired by the local representatives of Messrs. Siemens Bros. & Co., and of Messrs. Siemens Bros. Dynamo Works, Ltd., and that a combined exhibit representative of the various applications of electrical power was arranged by them.

NEW TRUNK TELEPHONE EXCHANGE AT LIVERPOOL

A NEW trunk telephone exchange has been opened by the Post Office at Liverpool. It has been equipped by the British Insulated and Helsby Cables, Ltd., to the specifications of the Post Office engineering department, and is on the lines of the trunk exchange at Bradford and of the exchange at Cardiff, of which detailed and fully-illustrated descriptions have already appeared in our columns (Electrical Engineering, Vol. III., p. 49, and Vol. IV., p. 721).

In Liverpool forty-two trunk and junction sections have been provided, each arranged to accommodate two operators. Each operator's position deals with five trunk lines, and between the two operators there is a desk for a telegraph operator, who works a superimposed telegraph circuit for giving the service instructions, so that the lines are permanently available for the trunk calls. The sections have the usual arrangements for concentrating all the lines at night on to about one-third of the working positions, and have also the requisite junction circuits to all the local exchanges in the Liverpool area, transfer circuits to other sections, a calculagraph, &c.

Two hundred trunk lines were transferred to the new sections quite recently, and nobody in Liverpool knew that the change-over was taking place, as everything worked quite smoothly.

The number of calls dealt with at the Liverpool exchange is between 8,000 and 9,000 daily. During January the average maximum delay was 24 minutes to London, 26 minutes to Glasgow, and 10 minutes to Manchester. About 400 calls are made to London, and 2,000 to Manchester daily. The greater part of the connections required are made in less than ten minutes from the time of the call, and in the afternoon there is practically no delay on any route.

Proposed Electric Railway in Germany.—The municipal authorities of the towns of Dortmund, Bochum, Essen, Mülheim, Duisburg, and Düsseldorf, have applied to the Minister of Railways for the joint concession for an electric railway connecting these industrial centres. The cost of the railway, which will have a total length of 47 miles with some 9 miles underground, is estimated at £5,000,000. The maximum speed of the trains is to be 75 miles per hour.

The New German Cable to South America.—The report for the past year of the Deutsch-Südamerikanische Telegraphen Ges., of Cologne, which was formed for the puprose of laying a submarine cable from Borkum to Pernambuco, Brazil, *viâ* Teneriffe, has just been issued. According to this report 710 knots of the Borkum-Teneriffe cable were laid by the end of 1908, and it is expected that this section will be completed by July of this year. It is not yet settled whether the cable shall touch at Monrovia or not, but, in any case, connection will eventually be made *viâ* Monrovia or Teneriffe with the German colonies in West Africa. Further particulars were given in Electrical Engineering, Vol. IV., page 376, and in the issue for Jan. 14th last, page 43.

The Electrical Export Trade of Germany.—According to the figures published in the German periodicals, the electrical export trade of that country for the last few months does not compare at all favourably with that of the corresponding period twelve months previous. This falling-of was, it is stated, first noticeable in November last, but was most pronounced in January last. In the latter month only 3,980 tons of electrical goods were exported, as compared with 5,480 tons in January 1908, a falling-off of some 27 per cent. The average monthly value of the electrical exports was rather more than £750,000, so that the above decrease represents a loss of some £200,000. All branches of the industry have been affected; the export of dynamos and motors was reduced from 2,121 tons in January, 1908, to 1,512 tons in the same month of this year. Italy is quoted as the country in which the demand for machines has most decreased. The cable exported has decreased in amount from 1,759 tons to 1,017 tons in the same respective months. Incandescent lamps are being exported in increasing numbers, however, owing to the enormous demand for metal filament lamps: the corresponding figures are 91 tons in January, 1908, and 102 tons in January, 1909.

THE REVOCATION OF THE BREMER FLAME ARC LAMP PATENT

Hearing of Appeal

IN last week's issue we gave a short note to the effect that the hearing of the appeal by the British Westinghouse Company against the decision of the Comptroller-General of Patents to revoke the Bremer flame arc lamp patent according to section 27 of the new Patents Act had been commenced. The text of the Comptroller's decision and an abstract of the patent in question were given in ELECTRICAL ENGINEERING, February 11th, page 143.

It will be remembered that the revocation of the patent was applied for by Mr. G. Braulik, on the ground that the patented article was manufactured mainly outside the United Kingdom. The owners of the patent, the British Westinghouse Co., first put forward evidence to show that they had manufactured "to an adequate extent," but the Comptroller interpreted the meaning of that portion of the clause to be "to such an extent as will substantially satisfy the demand in this country, even if no importation take place." As most of the lamps sold under the patent were manufactured abroad, the Westinghouse Co. would, the Comptroller decided, have to give satisfactory reasons why they did not manufacture to a larger extent in this country. In response to this, the company pointed out that the Bremer patent was taken out in 1902, and that a short time afterwards a similar patent was applied for by Herr Högner, of Messrs. Körting & Mathiesen. This firm manufactured and sold through their agents in this country, the Union Electric Co., lamps under the Högner patent to the number of 26 in 1903, 398 in 1904, and 2,348 in 1905. In the meantime, the British Westinghouse Co., having acquired the Bremer patent, had manufactured lamps in this country, but were not very successful. In 1905 the number sold was only 145. In March, 1906, the British Westinghouse Co. entered into an agreement with Messrs. Körting & Mathiesen, according to which the latter firm was granted a licence to manufacture under the Bremer patent for a period of five years; a royalty was to be paid on each lamp imported into the country, and the lamps of their agents, the Union Electric Co. and the Westinghouse Co., were to be sold at the same price. Under these conditions the Union Electric Co. put on the market 3,467 lamps in 1906, and the Westinghouse Co. 106; in 1907 the figures were 3,612 and 537, and in 1908, 2,777 and 530 respectively, of which all were sold with the exception of 274 lamps of the Westinghouse Co. The Westinghouse Co. claim that they were in active competition with the Union Electric Co. all that time, but that the German-made lamps were preferred. As the agreement with Messrs. Körting & Mathiesen did not terminate until 1911, they asserted that that was a sufficient reason for their not manufacturing to a larger extent.

Another reason was that there were several infringing lamps on the market. Writs had been served on the vendors of these lamps—namely, Messrs. D. Santoni, Messrs. Grevener, and Mr. G. Braulik, previous to the application by the last-mentioned party for the revocation of the patent. The Westinghouse Co. had suggested to the Comptroller that his decision should be withheld until the case relating to infringement had been heard, but he had not seen his way to do it. Under these conditions it was contended that the British Westinghouse Co. had not acted unfairly with regard to this country, and that, therefore, they should be allowed to retain their patent rights.

In his decision, the Comptroller pointed out that there was no evidence to prove that Messrs. Körting & Mathiesen could not, under their licence, manufacture lamps in this country and sell them at a profit, and concluded that the reasons given for not manufacturing to a larger extent in this country were not satisfactory. He, therefore, decided, subject to an appeal to the Court, to revoke the patent forthwith.

The appeal is being heard before Mr. Justice Parker in the Chancery Division of the High Court, and the hearing commenced on Wednesday, March 10th. Mr. A. J. Walter, K.C., and Mr. E. Russell Clarke are appearing for the British Westinghouse Co.; and Mr. W. R. Bousfield, K.C., and Mr. J. Hunter Gray for Mr. G. Braulik. The Board of Trade is being represented by Sir William Robson, the Attorney-General, and the Comptroller-General of Patents by Mr. A. R. Sargeant.

MR. WALTER, who opened the proceedings for the Westinghouse Co. on Wednesday, first dealt with the interpretation which he put upon the Revocation Clause of the new Act. The object of the clause was, he thought, to ensure that articles protected by British patents, and sold in this country, should be manufactured mainly in this country. According to the wording of the clause, it was the "patented article" which was to be manufactured in this country, and he asserted that this meant only those articles which were protected by the patent, or manufactured under a process partly or wholly protected by the patent, and that it was quite irrevelant, when considering the demand for the patented article, to take into account similar articles which might either be infringements of the patent, or articles manufactured under a similar patent. The exact meaning of the word "mainly" in the clause was a matter for his lordship to settle; it might mean more than 50 per cent., or it might mean 90 per cent. With regard to the sub-section of the clause, in which it was stated that the manufacture of the patented article was to be carried out to an "adequate extent" in the United Kingdom, he took this to relate to the *demand* for the *patented* article in the *United Kingdom only*. He could not imagine that the phrase should relate to the British share in the trade of the whole world in the patented article. There might be a large demand for the article in general, but unless the particular pattern of that article manufactured under the patent in question was either better or cheaper than other patterns, there would not be a demand for the "patented article." The law had been framed to prevent any patentee from using his British patent rights in an unfair way as regards this country. In certain cases foreigners had taken out British patents for an article, and had not only refrained from manufacturing in this country, and from granting licences to manufacturers in this country, but had refused to sell the patented article to the British public; this the present law would prevent. Mr. Walter then pointed out that all the petitioners so far under the new Act had been foreigners, and that, under certain conditions, one of the immediate results of the revocation of any patent would be the free importation of what were previously infringements from countries where labour was cheaper than it was here. Turning to the case in question, he admitted that the larger number of the lamps manufactured under the Bremer patent and sold in this country had been manufactured abroad, and stated that the British Westinghouse Co. had abandoned the argument relating to adequate manufacture. He asserted, however, that the reasons given above for not manufacturing to a larger extent in this country were sufficient. It should especially be remembered that the agreement with Messrs. Körting & Mathiesen had been entered into before the framing of the Act of 1907.

SIR WILLIAM ROBSON, the Attorney-General, who represented the Board of Trade, speaking with reference to the meaning of the expression "exclusively or mainly," asserted that "mainly" evidently meant "almost exclusively," and therefore could not be construed to mean only rather more than 50 per cent. He agreed with Mr. Walter that the phrase "adequate extent" related to the demand in this country, but was of the opinion that his interpretation should be extended so that the phrase meant the demand, not only by the British public for home use, but also by British manufacturers for their export trade. The Attorney-General and Mr. Justice Parker then had a lengthy discussion as to the meaning to be put upon the expression "satisfactory reasons." The former held that the employment of such general wording in the clause was the only way in which justice could have been ensured, and that the Comptroller of Patents would have to consider separately the circumstances of each case, and use his own discretion. It would be a satisfactory reason for not manufacturing if it could be shown to be commercially impracticable. The age of the patent, the demand for the article, conditions of labour, raw products, and many other things would have to be taken into account. That large factories for manufacturing the article already existed in other countries would not be an excuse. Allowance should, however, be made when arrangements for manufacture had been made before the passing of the Act. The intention of the Act was, he said, to allow of unrestricted competition if the patentee would not work his patent in this country, or could give no satisfactory reasons for not doing so.

On Thursday, MR. RUSSELL CLARKE also addressed the Court on behalf of the Westinghouse Co., and contended that the meaning of the word "adequate" was sufficient to meet the demand for the English-made article. As most buyers preferred the German-made lamps, then the manufacture had been sufficient to meet the demand for the English-made article. He agreed that in this view he differed somewhat from his leader, Mr. Walter.

MR. W. R. BOUSFIELD, K.C., speaking for Mr. Braulik in favour of the confirmation of the revocation, did not argue in any detail the definition of "adequate," for the reason that the appellants had abandoned that part of the case, admitting that the majority of the lamps had been made abroad. The point before the Court was as to whether the reasons adduced for not having manufactured most of the lamps here were sufficient. On this head he relied upon the broad policy of the Act, which

Digitized by Google

placed a serious responsibility upon the Judge to consider the rights of the public as well as those of the patentee. The broad policy of the Act was to secure employment for the people and the investment of capital in this country. The Westinghouse Co., by entering into the contract with Messrs. Körting & Mathiesen for the manufacture of the lamps under licence, had knowingly and willingly placed it out of their power to create a successful lamp industry in this country, having admitted in their evidence before the Comptroller their inability to compete with the German makers.

Mr. Justice Parker pointed out that there was the possibility that if he confirmed the revocation of this patent he would kill the whole of the lamp department of the Westinghouse Co., and therefore go against the whole purport of the Act, viz., to encourage manufacture in this country. Any number of infringements could be made if the patent were revoked.

Mr. Bousfield, in reply, referred to the words of the Attorney-General on the previous day, who stated the intention of the Act was, if the patentee was not prepared to carry on his patent, and could give no satisfactory reasons, to throw the whole thing open to unrestricted competition. He took his stand by this statement, which was the whole purport of the Act, and if the Judge construed the Act in any other sense, then he thought it would be useless to argue the matter.

Mr. Justice Parker said that he must take into account the reasons, and it might be that the contract with Körting & Mathiesen was the only thing possible under the circumstances. If he could find in the evidence an act which the patentees ought not to have done, then he should say the reasons were not satisfactory. He was bound to consider whether what had been done was reasonable from the point of view of a business man having regard to his obligations.

Mr. Bousfield contended that the agreement with Körting & Mathiesen was an act which the patentees ought not to have done. This contract, in fact, arranged for the importation of lamps both from Germany and America. It also provided that no other licensee should be appointed except upon payment of a royalty 50 per cent. greater than that paid by Körting & Mathiesen. But it was stated in the agreement that this did not—as, of course, it could not—apply to compulsory licenses—thus clearly contemplating the possibility of compulsory licences being granted for not manufacturing the patented article mainly or exclusively in this country. In all the Westinghouse Co. were setting up against themselves rivals with whom they admitted they could not compete.

Mr. Justice Parker said that this was the first time he had heard of the contents of this contract, and it was most vital to the success of the case.

Mr. Bousfield here took the opportunity of protesting against the manner in which the evidence had been placed before the Comptroller.

Mr. Justice Parker said that the evidence given before the Comptroller was not satisfactory at all. There were many things which he should have to know in order to give a decision. For instance, what amount of plant had been put down by the Westinghouse Co., and would it have been possible to manufacture here and get a profit greater than the royalty paid by Körting & Mathiesen. The onus was upon the patentees to prove that the allegations were wrong, but they had treated this very serious responsibility in a most perfunctory manner. They had sent up a secretary with second-hand information, and he was inclined to agree with Mr. Bousfield that on the evidence before him it was a case for revocation. At the same time, it was quite possible, seeing that he himself was not sure whether he appreciated the true meaning of some of the sections of the Act, whether the patentees really realised their position, and he was partial to leniency in this matter, as it was the first case of its kind. Therefore, if an application were made to put in further evidence, he should feel bound to admit it, although that must not be regarded as a precedent.

Mr. Bousfield said that the admission of further evidence would entail a great expense to his client, who was a poor man, and he should ask for costs on this part of the case. It might even be that his client would have to drop the action if this extra expense were put upon him. At the same time, he urged that the Judge should be satisfied with the materials before him, as the patentees had been content to rest their case upon them before the Comptroller. He thought the Judge was showing an extravagant amount of mercy to the patentees.

Mr. Justice Parker said the withdrawal of Mr. Braulik would not make any difference to the case going on. It had now reached a stage when it was not a matter between parties, and he was bound to give a decision. It might be that he should hold it to be a case for granting time within which to commence manufacture on an adequate scale.

Mr. Walter then formally applied for permission to put in further evidence, and this was granted.

After some discussion it was decided that further evidence, on affidavit, should be placed before the Judge within two weeks. The decision as to costs was reserved.

At the close of this discussion, Mr. Walter, as a justification for the manner in which the evidence had been placed before the Comptroller, referred to the rules made by the Board of Trade under the Patents Act. These allowed any person to make an allegation that a particular patent was not being worked in this country, without giving proof, and then the onus was upon the patentee to prove to the contrary. Thus, although the patentee was the defendant, so to speak, he had to open the case, with the result that the whole of his books had to be placed at the disposal of the applicant, who would be, in most cases, a trade rival. In fact, Mr. Walter went so far as to say that the rules were being used with the object of getting at the books of trade rivals.

Mr. Justice Parker said that if this was the intention of the legislature, then the sooner patents were discontinued the better. The rules were certainly not consistent with the Act, as, in his opinion, the onus of proof should be upon the applicant.

Mr. Bousfield said that the intention of the legislature was to cause patents to be worked in Great Britain, and any person making an application for revocation was fulfilling a public duty.

Mr. Justice Parker: Do you think that a man who is bringing an action like this in order to get rid of an action for infringement is fulfilling a great public duty?

Mr. Sargeant, on behalf of the Comptroller-General of Patents, said the point raised by Mr. Walter had been appreciated by the Comptroller, who felt it to be extremely hard on the patentee.

It is probable that the case will not come on again before the Easter vacation.

THE DEMAGNETISATION OF BAR MAGNETS

A PAPER "On the Self-Demagnetising Factor of Bar Magnets," by Prof. S. P. Thompson, F.R.S., and Mr. E. W. Moss was read before the Physical Society on February 26th. This Paper consists of three parts:—(i) A discussion of the significance and definition of the self-demagnetising factor of magnets in general, and of bar-magnets in particular; (ii) a redetermination of the values of the self-demagnetising factor for bar magnets of circular section; (iii) determination of the values of the self-demagnetising factor for bar-magnets of rectangular cross section of various proportions. It is shown that, in general, for every bar-magnet there is a self-demagnetising action the value of which at the middle of the bar depends, for a given intensity of magnetisation, on the length of the bar relatively to its cross section, on the permeability of its parts, and on the distribution of its surface-magnetism. Owing to the circumstance that with every kind of steel the permeability is neither constant nor stands in any simple relation to the flux-density, any calculation of the actual polar distribution for rods and bars is impracticable. The only form of magnet that is practicable for calculation is that of the ellipsoid, the properties of which are that for any and every value of the permeability, and in any uniform field, the surface magnetism is so distributed that the magnetic force which this distribution exerts in the interior is uniform at every point within, and therefore the internal demagnetising force everywhere within is constant. The amount of self-demagnetising force per unit of intrinsic magnetisation is recognised as the self-demagnetising factor, and has a definite value for ellipsoids of revolution of any assigned ellipticity. In the case of cylindrical bar-magnets the ratio of the nett value of the self-demagnetising force for the whole bar divided by the internal magnetisation is called the self-demagnetising factor. The dimension-ratio of a bar-magnet is taken as the length divided by the square root of the cross section. Experiments were first made on the values of the self-demagnetising factor for bar-magnets of circular section, and the results compared with those obtained by Du Bois and Riborg Mann. The values obtained are lower than those found by either of the experimenters named. The determinations were carried down to shorter rods than those examined by either of them, and the discrepancies between their results and the present ones are smaller as the dimension-ratios are larger. It is pointed out that one explanation of the differences may be due to the fact that the magnetising solenoid employed by Riborg Mann was not sufficiently long. Experiments were made to determine the self-demagnetising factor for bar-magnets of rectangular cross section, and it was found that for equal values of the dimension-ratio the factor for bars having a sectional ratio of 2:1 was about 93 per cent. of that for bars of square section; while for flat bars, having a sectional ratio of 10:1, the value of the self-demagnetising factor went down to about 75 per cent. of that for bars of square section.

Elimination of Moisture from Transformer Oil.—A German firm has recently put a form of heating apparatus on the market which is particularly designed for immersing in the cases of oil-cooled transformers for the purpose of driving moisture out of the oil. It consists merely of a number of resistance units, mounted on an iron frame, connected to take 42 amperes at 440 volts.

THE DIELECTRIC STRENGTH OF COMPRESSED AIR

THE paper read by Mr. E. A. Watson on Thursday before the Institution of Electrical Engineers consisted of the results of experiments made with the object of determining the manner in which the dielectric strength of air changes when it is compressed to pressures higher than atmospheric, with a view to its employment for the insulation of high-tension apparatus for which oil is not suitable. Spherical electrodes were employed in all the experiments, as the maximum dielectric stress is calculable when the voltage distance apart, and diameter of the sphere are known. According to Dr. Russell, the dielectric stress at the surface of the sphere is equal to the ratio potential difference divided by distance apart, multiplied by a function (f) of $\frac{x}{a}$, a being the radius of the spheres employed, and x the distance between them. The values of f for different values of $\frac{x}{a}$ as given by him were used for deriving the true dielectric stress from the observed breakdown voltage. Dr. Russell has shown that if the distance apart of two spheres is less than the diameter of one, a disruptive discharge will ensue as soon as the maximum dielectric stress at the surface of the spheres reaches the dielectric strength of the air; whereas if the distance apart is greater than the diameter of a sphere, the first effect which occurs is the formation of a zone of disrupted air around the sphere increasing its virtual radius so as to reach a stable condition. As the pressure increases, the radius of this zone grows larger, until eventually a discharge takes place. The breakdown voltage for a given distance apart of the centre of the spheres will generally be found to have a maximum value when the distance apart of the spheres is approximately equal to their diameter. As soon as the distance apart of the spheres exceeds their diameter, a corona or zone of disrupted air forms before actual disruption takes place, and the relation between the voltage and gap length changes. The curve connecting spark length and voltage should then theoretically become a straight line. It was actually found, however, that the formation of a corona and a change in the shape of the curve did not take place until the distance between the electrodes was many times greater than that given by the theory. This is well shown in Fig. 1, in which are given the

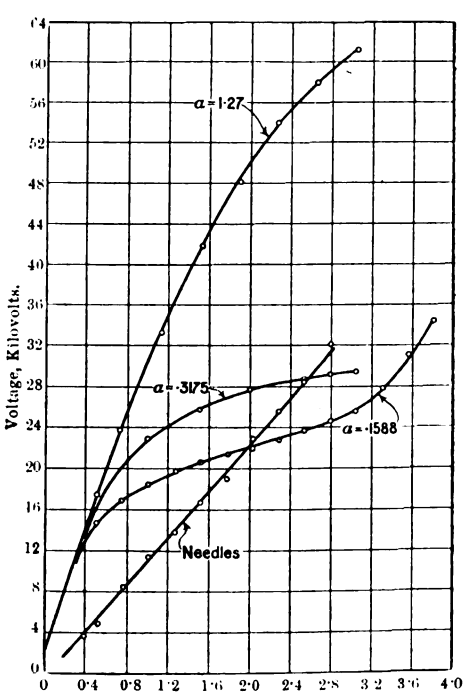

FIG. 1.—CURVES SHOWING EFFECT OF THE SHAPE OF ELECTRODE ON THE BREAKDOWN VOLTAGE.
(a = radius of sphere in centimetres.)

curves obtained for spheres of radii 1·27 cm. (0·5 in), 0·3175 cm. (0·125 in.), and 0·1588 cm. (0·0625 in.) respectively and also for needle-points. It will be noted that the needle-point curve is a straight line, as is predicted by theory. The curve for the smallest spheres after cutting the needle-point line turns up again as if it were running towards the needle-point line as an asymptote, the point of inflexion being at the point where it cuts the needle-point line. The curve for the next largest spheres also cuts the needle-point line. If it is assumed that the corona surrounding the needle-points is circular in shape, then the curves for the spheres should not cut the needle-point line. Again, the gap at which the corona was first observed, and for which the curve first showed signs of turning up, instead of being equal to the diameter of the spheres employed, was in the case of the smallest spheres about six times as great. It is difficult to explain why this should be so. It appears to point to the possibility that the layers of air near the surface of the electrode have a greater dielectric strength than the main body. With this exception the results of the experiments agreed very fairly indeed with theory.

Two sets of measurements were made, with alternating-current pressures derived from a step-up transformer and with direct-current ones from an influence machine. In both sets the spark-gap consisted of a cast-iron case fitted with removable ends, and equipped with observation windows and fittings for pressure gauge and inlet valve. The electrodes were mounted on rods carried through ebonite bushings in the ends of the case. In the alternating-current measurements the maximum voltage was obtained either by multiplying the effective voltage by the amplitude factor, or by means of an electrostatic voltmeter, connected across a condenser, charged at the correct point in each revolution of the alternator. The frequency of the supply was 50 cycles per second, and the maximum voltage obtained about 32,500 volts. For measuring the direct-current voltage, two condensers were connected in series across the spark-gap. These condensers had their outer coatings connected to a micro-ampere meter, which was shunted by a small spark-gap of a few thousandths of an inch, while choking coils were interposed between the condensers and the micro-amperemeter. The charging current of the condensers, being a steady flow, passed through the micro-amperemeter and deflected it, whereas the discharge, being oscillatory, jumped the auxiliary gap and was not recorded. The capacity of the condensers and the frequency of the sparks being known, the voltage was readily calculated. Two high resistances of about 0·5 megohm each were connected in series with the micro-amperemeter, one on either side. These gave a pressure drop of about 8 to 10 volts. Across this combination was connected a condenser, and this arrangement acted as a store for a considerable quantity of electricity, so that a perfectly steady deflection readable to ¼ of 1 per cent. could be obtained.

A great deal of trouble was experienced with the high-tension condensers, as it was essential that the spreading of the charge at the edge of the coatings should not be allowed to take place. Also it was important that the leakage current passing through them should be negligible compared to the charging current. Condensers consisting of ebonite tubes 8 mm. thick, coated inside and out, and filled with oil, answered satisfactorily for a long time, but eventually punctured at 75,000 volts. They were used for all the direct-current measurements given. Condensers with compressed air as the dielectric were tried, but although they did not break down at 100,000 volts, they passed such a large leakage current as to be quite useless.

The curves obtained with spheres 1 in. diameter using alternating current were very nearly straight lines, as the distance apart was small compared to the diameter of the spheres. The curves obtained with ⅛ in. spheres were nearly straight lines at the high air pressures where the spark length was small, but bent over more and more as the pressure was lowered and the spark length corresponding to a given voltage increased. These curves show that the statement that the spark length is inversely proportional to the gas pressure only applies when the radius of curvature of the electrodes is indefinitely large. Thus a voltage of 24 kv. will spark 2·53 cms. at atmospheric pressure, but only 0·26 cm. or little more than $\frac{1}{10}$th of this amount under a pressure of 2·58 atmospheres, with ⅛ in. spheres. Hence under certain conditions a small increase in the air pressure will effect a very great decrease in the liability to breakdown. The curves for the small spheres (⅛ in. diameter) obtained with direct current, were similar to the alternating-current ones, but bent over more. These curves could not be carried further than the pressure corresponding to the formation of a corona on the electrodes, as the leakage current which flowed dropped the volts of the influence machine to such an extent that sparks could not be obtained. The fact that all these curves stopped at the same gap length shows that the distance apart at which the corona forms is independent of the gas pressure and depends only on the shape of the electrodes. This shows that it is not possible to prevent

Digitized by Google

the formation of a corona on a spark-gap previous to the actual discharge merely by placing it in compressed air.

In order to deduce figures for the dielectric strength of air from the results, only the direct-current measurements were employed, as in the alternating-current measurements the distances were extremely small. The direct-current measurements could be also made with a greater degree of accuracy. The results are plotted in Fig. 2. It will be seen that the dielectric strength is greater the smaller the spheres employed. For the largest spheres the mean value of the measurements at atmospheric pressure gave 38·85 kv.-cm. as the dielectric strength of air. The curves are very nearly straight lines, cutting the axis of zero pressure at a point which for the case of the larger spheres is about 12 kv. per centimetre, and in the case of the small ones is even higher. That the results from the different-sized spheres are not in closer agreement can hardly be due to the formulâ deducing the dielectric strength from the observed

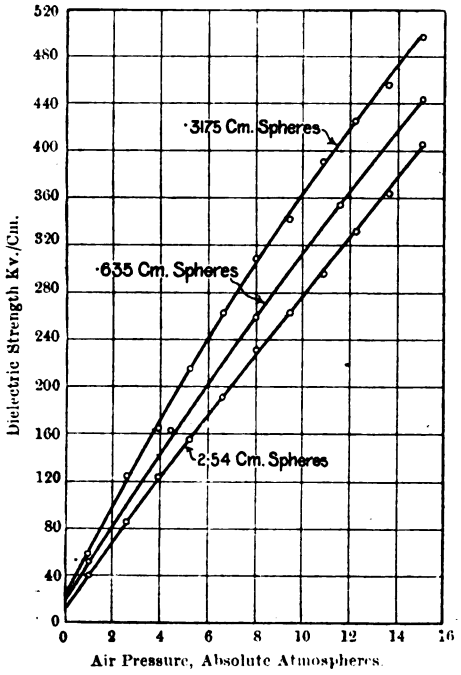

FIG. 2.—RELATION BETWEEN DIELECTRIC STRENGTH AND AIR PRESSURE.
(Values of Dielectric Strength calculated for Uniform Stress from Observed Breakdown Voltages.)

breakdown voltage being in error. The supposition of a layer of air on the surface of the electrode of greater strength than the main body would serve to explain this if it were assumed that the effect was greater when the radius of curvature of the sphere was small. For practical purposes, however, the lower curve may be taken as being nearly correct. It appears that the dielectric strength of air at ordinary temperature (17° C.) follows very nearly a linear law, but that the curve does not pass through the origin, so that the dielectric strength cannot strictly be said to be proportional to the pressure. The equation--

$$\text{Dielectric strength} = 20 + 25{\cdot}6 \text{ (pressure)}$$

expresses the relation between the pressure of 3 and 15 atmospheres absolute. It will be seen that under pressures readily obtained in engineering work the dielectric strength reaches high values, equal to that of a solid or liquid dielectric. Compressed air as an insulation has considerable possibilities for certain cases as it is free from viscosity and residual charge effects, and is not permanently injured if it is broken down.

The author exhibited an electrostatic voltmeter, the working parts of which were enclosed in an iron case containing CO_2 at a pressure of 150 lb. per sq. in. Pressures up to 75,000 volts could be measured directly with this instrument.

DISCUSSION.

Dr. ALEXANDER RUSSELL objected to the use of the phrase, "dielectric strength," and thought that "electric strength" was quite sufficient. He agreed that if the minimum distance between the spheres was less than their diameter, a disruptive discharge took place when the dielectric stress exceeded the electric strength of the air; he did not, however, agree that a corona was necessarily formed if the distance between the sphere was greater than their diameter; the distance at which a corona formed could, no doubt, be calculated. The author had shown how to find it experimentally in his Fig. 1, where there was a point of inflection in the curve. With regard to the different values for the electric strength of air, using difference-sized spheres, he thought these might be explained by a consideration of what used to be called the minimum sparking potential between electrodes. Professor Strutt had shown that the potential difference between the cathode and the negative glow was constant, whatever the pressure of air. It was given as about 350 volts, and, as the pressure of air increased, this negative glow approached the cathode, and ultimately disappeared into it. If they assumed that the pressure on the Faraday tube, which was subject to the maximum stress, was not the potential difference between the spheres, but that potential difference minus 350, then he thought that this assumption would be sufficient to explain the difference. With regard to his own formula for the dielectric stress at the surface of a sphere, this could not be used when the electrodes were close together, because the ionisation was excessive; neither could it be used when a corona had formed. It could not be used also with very high frequency pressures, such as occurred in wireless telegraphy with spark gaps used for safety devices in transmission lines. With impulsive rushes of electricity the sparking distance seemed to be absolutely independent of the shape of the electrodes, but for values of frequency up to 100 the formula was approximately true.

Mr. C. C. PATERSON (National Physical Laboratory) asked whether it had been necessary to continually polish the spheres in order to obtain good results. American observers regarded it as very important to clean them after every discharge. Another point was that the experiments had apparently been carried out in a cylinder in which the air must have been very thoroughly ozonised; he did not know whether the dielectric strength of ozonised air was any different to that of air which was less ozonised. With regard to the ebonite condensers, a long series of experiments had recently been carried out at the National Physical Laboratory on the dielectric strengths of different kinds of ebonite, and the figures worked out to something like 50,000 to 100,000 volts per millimetre.. The authors' eight millimetres of ebonite had broken down at something like 30,000 or 40,000 volts, and this showed what enormous stresses could be got in the materials if they had not got the ideal condition of an equal potential gradient. For this reason he thought it was wise to use a factor of safety of 10 or 20.

Professor GISBETT KAPP (Birmingham University) asked for information as to what the electrical stress would be if the pressure was reduced below atmospheric pressure. In power transmission lines which were situated in mountainous countries the lines had to be put further apart in high altitudes, where the air pressure was less than in the plains. A Paper by Professor Ryan, which was published in the *Journal* of the American Institute of Electrical Engineers in 1904, dealt with this matter, and he hoped that Mr. Watson would verify Professor Ryan's results for pressures below atmospheric. The breakdown pressure was not so important as the point when the brush discharge began, because it was at that point in power transmission lines that energy began to be lost, and the line ceased to be efficient.

Mr. E. H. RAYNOR (National Physical Laboratory), referring to Dr. Russell's formulæ mentioned in the Paper, said that Dr. Russell gave two values for f; one to be used when the earth potential was half-way between the extreme potentials, and the other to be used when one of the electrodes was at earth potential, and the result for the dielectric strength varied considerably between the two cases, especially if the two spheres were a long way apart. The author did not state anywhere whether he had been careful to keep the spheres equally distant from earth potential, or whether one of them was at earth potential. He could not say how it was possible to actually fix earth potential with direct-current work, unless a high resistance was connected across the gap and the middle point earthed. There would be an error from 30 to 50 per cent. if one was not careful to fix the earth potential. With regard to the measurement of direct-current voltage, the author's figures related to a succession of sparks, and it was doubtful whether he had obtained the proper dielectric strength, as the second spark gave an enormously reduced voltage. The reason for this was that the air in the spark gap became ozonised. He thought that an electrostatic voltmeter might have been used in the experiments with direct current. The author did not say how the leakage current of his condensers had been measured. It would be interesting to know what the power factor of these very high-voltage condensers really was.

Prof. J. T. MORRIS (East London Technical College) suggested that the sides of the condensers should be eight millimetres thick at the top and the bottom, and turned down in the lathe to something like two millimetres at the sides, and, by putting tinfoil inside and out, this would increase the capacity considerably, and diminish the dielectric stress at the edges. A guard ring should also be used.

Professor SILVANUS P. THOMPSON said the Paper brought out once more the fact that the layers of air close up to a dielectric when there was no brush discharge are apparently stronger than those away from the surface of the conductor, and, in fact, thin layers, when taken in the gross, were stronger than thick

Digitized by Google

ones. There was a kindred effect in the arc, although the analogy must not be pressed too far. Possibly the explanation in the present case might be found in some difference in the dielectric capacity of the air in the immediate neighbourhood of the electrodes, as then the fall of potential per unit of length along the gap would not be a straight line. From the curves of Fig. 2, the dielectric strength at four atmospheres pressure with ⅛-in. spheres was about 170,000 volts for a one-centimetre gap, whereas in another curve with a similar spark length of one centimetre the dielectric strength was 45,000 volts. He would like this apparent discrepancy explained. In conclusion, with regard to the application of these results to wireless telegraphy, he said that it was now something like 10 years ago since Mr. Jervis Smith at Oxford discovered that there was an appreciable effect by increasing the air-pressure round the spark gap in a transmitter, and quite recently he had obtained very important results.

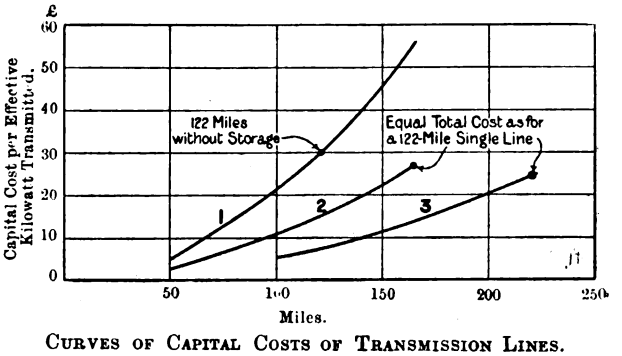
Mr. E. A. Watson, in reply, agreed with Dr. Russell that "electric strength" was the right term. With regard to Dr. Russell's formulæ, there was no better authority than himself, and what he said must be taken as correct. The explanation in the delay of formation of the corona by assuming a small constant drop looked all right, but there was one point which put him against accepting it. This arose in connection with the study of some tests by Ryan and Mershon in America on the critical voltage for brush discharge in transmission lines. Ryan's figures showed that the dielectric strength went down from about 72,000 to 45,000 volts per cm. in going from wires of 1/20 in. to 0·04 in. diameter. If a small quantity were subtracted, it would not be sufficient to account for any discrepancy which existed. In answer to Mr. Paterson, he found that so long as the spheres were fairly smooth, there was no need to polish them after every spark. With regard to ozonisation, he had found there was very little. If ozone was formed, it was probably destroyed by the spark. After making a test, it was impossible to detect any smell of ozone. With regard to Mr. Raynor's query as to the effect of a single spark and a succession of sparks, the output of the influence machine was only about half a watt, and, consequently, owing to the small amount of energy in the sparks, and the absence of ozonisation, there was no difference between a succession and a single spark. The leakage of the condensers was less than 1 per cent. of the working current. With regard to the apparent discrepancies pointed out by Prof. Thompson, these were simply due to uneven distribution of electrostatic flux. The results given in the curves of Fig. 2 were for the dielectric strength in true kilovolts per centimetre where the stress was uniform, and were calculated from the observed values of the breakdown voltage. With small spheres there was a very uneven distribution of stress, which accounted for these differences.

BATTERIES AND TRANSMISSION LINES

Mr. A. M. TAYLOR read a paper entitled "Extending the Limits of Power Transmission, as applied both to long-distance Transmission of Power and to Power Companies' Areas" before the Birmingham section of the Institution of Electrical Engineers on Wednesday, March 10th. The object of the paper was to urge that great economies in capital expenditure could be obtained by the use of electrical storage on a large scale on power systems. Dealing first with long-distance overhead lines, Mr. Taylor worked out the estimates for capital cost of 27,000 volt lines of varying lengths which are embodied in the first curve of Fig. 1. It was pointed out that, especially in districts where inspection is difficult, duplicate lines are often required; but the author claimed that the installation of a battery at the receiving end would render this unnecessary. Apart from this, however, he argued that there would be a saving as follows:—

The batteries would be arranged to take up 50 per cent. of the peak, thereby halving the copper costs for the line. In the case of a 10,000-k.w. 122-mile transmission with a single line, it will be found that, without raising the E.M.F. or increasing the line drop, the radius of transmission can be extended to 165 miles for the same total capital cost of 30+6=£36 per kw. transmitted. To cover this distance, *with a single line*, and with the E.M.F. limited to 27,000 volts, would have cost, without storage, some £63 per kw. transmitted. The storage scheme is thus some £27 per kw. the cheaper, as far as the line is concerned. If the 122-mile line above considered had been run in duplicate, as regards the copper, only one line of poles, however, being provided, the radius of transmission could have been extended from 122 miles to about 230 miles without increasing the capital costs of the line.

If, as suggested above, we take account of the much greater facilities for regulation provided by the employment of storage at the receiving end of the line, it will be found possible to double the resistance drop in the line and thus to roughly double the distance of transmission. Thus, the 122-mile single line considered in Fig. 1 *could be lengthened to* 220 *miles*, without any additional cost being incurred on the line, by the employment of storage; while, had the line been originally laid out in duplicate (as far as copper is concerned), it could have been extended to 304 miles for the same total cost in copper and supports.



The batteries and auxiliaries required for storage can in most, if not in all, cases be provided for out of the saving in generating plant, step-up and step-down transformers, turbines, head works, and buildings, only half the horse-power being needed that would otherwise be required.

Mr. Taylor puts the cost of batteries suitable for the purpose at about £10 per kw., to which about £3 10s. per kw. must be added for auxiliaries and accessories on alternating current systems. Where the batteries cannot be paid for out of the saving in generating plant, they must, of course, be paid for in part out of the line savings, *i.e.*, the full benefit of the increased lengths above indicated, cannot be obtained.

The author then considered the case of power companies covering large areas with underground cables, in which he considers that the use of batteries offers equally great advantages. It was pointed out that if a power company has to run a special feeder out to a town on the outskirts of its area, it may easily happen that the costs of that feeder may run into £10 per kw. of maximum demand. Mr. Taylor holds that in this case the savings in fixed charges would alone pay for the cells, and the saving could be put down as profit. Or, again, a power company covering a very large area and confined, by lack of facilities for cheap power production, to one part only of this area for its generating station, might find it practicable to reduce the costs of its general transmission and distribution system materially, as well as improve the reliability thereof, by employing large batteries in its own sub-stations.

A case is worked out for a 10-mile 1,000 kw. feeder, which without batteries would have to be laid in duplicate, and a clear saving of £8 to £10 per kw. is arrived at.

Attention is then called by the aid of a table and some sketch maps of the distance apart of the stations in a number

Curves of Capital Costs of Transmission Lines.

1. 27,000 Volts (Initial Pressure). Line Drop 15—20 % (Including Reactance).
2. Same Line with Accumulators 27,000 Volts (Initial pressure). Line Drop 15—20% (Including Reactance).
3. Same Line with Accumulators 27,000 Volts (Initial Pressure). Resistance Drop increased from 7—14%.

of power schemes. In view of the saving, both in capital cost and in working expenses, of large stations as against small ones—the saving in the former being given by Mr. Addenbrooke recently as amounting to £17 per kw. of maximum demand, exclusive of distribution, as between 2,500 kw. and 40,000 kw.—the author thinks that sufficient attention has perhaps hardly been paid to the desirability of covering a large area from a given power station, even at, if necessary, rather higher costs for distribution.

It is pointed out how, by the use of accumulator sub-stations, the load transmitted at the time of the peak can in most cases be reduced to one-half or less. This may be taken advantage of, he continues, either to cut down copper and save in capital outlay in the transmission line, or to double the *length* of that line and increase the distance between generating stations from, say, 18 to 36 miles. It will be granted that the voltage regulation at the boundaries of the system will be so improved by the employment of the battery sub-stations that a greater loss in transmission may be allowed, and thus sufficient copper be saved

Digitized by Google

to both double the length of the copper conductor and pay for the cost of insulating, armouring, and laying the additional length.

It will also be granted that such an extension of the radius of supply would, in many cases, represent quadruple the load on a single station, and enable companies supplying sparsely populated districts, or large areas, to avail themselves of the saving in the capital invested in, and in the working expenses of, the generating station, which Mr. Addenbrooke very rightly pointed out can be made.

The paper concludes with a few general remarks, mentioning the "split-pole" converter used in America for coupling batteries to alternating current systems, and points out that the efficiency of conversion of such plant is not of great importance considering the savings that can be made in other directions. The paper also contains a table of particulars of continental transmission lines, taken from a foreign technical paper, and some plans of the system of the Société Energie Electrique du Littoral Mediterranée.

DISCUSSION.

The discussion was opened by Mr. W. E. Chappell (British Westinghouse Co.), who said that he was unable to agree with many of the statements put forward by Mr. Taylor. In his Paper the author had given £500 per mile as a price which might easily be reached for heavy overhead lines, but he had figures before him of a 10,000-kw. heavy line with iron poles which had been erected complete at a capital cost of £293 per mile. He did not consider it to be policy to erect light lines with wooden poles, as these have to be renewed every 10 years. He would allow on the copper part of the line depreciation at 5 per cent. In the United States there had been five systems put down similar to that proposed by the author, and of these one had already been shut down. Of the other systems it had been found that the regulation had not been good, in spite of the batteries.

Mr. T. P. Kemp (Birmingham Corporation) agreed with the author that increased economy and reliability were obtained by the use of accumulators at the distributing end of a transmission line. He considered, however, that to put the cost of current generated by steam for charging purposes at 0·1d. per unit was too low a figure. He would like the author to state what percentage of the peak load he considered the battery ought to take.

Mr. F. Forrest (Birmingham Corporation) considered that the density of 250 amps. per sq. in. which the author had proposed was far too low, and that the density should be more in the order of 2,000 amps. per sq. in. He also thought that there would be no greater security from breakdown by the use of a battery with one transmission line as against two transmission lines with no battery. Mr. Taylor stated that, with a battery and single line, it would be possible to shut down the latter for repairs while the battery took the load. He wondered whether this could be done, as it appeared from the author's figures that the generating plant plus battery would be required all day, and, as the battery would have to be charged most of the night, very little time would be left during which the line could be made dead.

Mr. N. B. Rosher (Birmingham) wished to know how the author arrived at his figure of 25 per cent. for interest, sinking fund, maintenance, and depreciation on the copper part of the transmission line. Assuming interest to be at the rate of 5 per cent., and depreciation and sinking fund 8 per cent., this would leave 12 per cent. maintenance, an extremely high figure especially in view of the fact that the copper part of the line only was included, and not the supports. He also pointed out that the improvement obtained by the use of a battery to supply 50 per cent. of the peak load would, when expressed in percentages, mean an improvement of at least 40 per cent. in the load factor.

Mr. W. E. Groves (Birmingham Corporation) also spoke.

Dr. G. Kapp considered that a battery was not a very reliable adjunct to depend upon. He gave an interesting account of the various proposals made by himself for electric supply to the town of Lucerne. The generating station was situated at Engelberg in the mountains. An accumulator sub-station was considered in connection with the H.T. transmission, but it was finally decided to construct an artificial lake above the generating station into which water would be pumped by electric motors at times of light load, the lake in this instance taking the place of a storage battery. As a matter of fact, a steam plant in the city was retained as a standbye in case of the breakdown of the line.

Mr. G. L. Addenbrooke, in a written communication, stated that, in a Paper read by himself before the Institution of Electrical Engineers in 1896 on "High Voltage Lamps and their Influence on Central Station Practice," considerable space was devoted to the use of accumulators with a view to reducing the cost of feeders, and much the same arguments were used as employed by Mr. Taylor. The cost of accumulators was then put down at £13 per kw. for the battery alone as compared with £10 given by Mr. Taylor. Costs for accessories and buildings brought up the cost to £19 per kw., as against Mr. Taylor's estimate of £13 10s., which amount did not appear to include buildings. During the last 13 years his suggestion as to the use of accumulators had not found general favour, not probably on account of the matter being overlooked by engineers, but because, after fully considering the circumstances of each installation, the balance of advantages on the whole did not warrant the outlay on accumulators. From the costs above mentioned, it did not appear that the relative position has altered much, and it would appear, therefore, that, although it is difficult to put down arguments on paper against the proposition, still, in specific projects, there are good reasons for not using the apparent advantages of accumulator storage. However, a reduction in cost or improvement in the manufacture of accumulators would lead to an extension of their use, and in connection with a large power company it had occurred to him that it might pay them to run an accumulator factory themselves, doing their own repairs and renewals. Mr. Taylor did not appear quite to grasp the fact that, assuming a line was necessary, the cost of double the section of copper or of raising the voltage 50 per cent. was a comparatively small addition to the total cost of the scheme; 50,000 rather than 27,000 volts would be used even in this country for 100-mile transmission, so that it is not fair to base calculations on the lower voltage. Doubling the voltage increased about four times the amount of energy conveyed, with the same percentage drop, and, consequently, entirely altered the conditions.

Mr. Taylor, in reply, said that, with regard to the suggestion that the density should be 2,000 amps. per sq. in. instead of 250, he had made a calculation that if this density were adopted, the generating pressure would be 200,000 volts instead of 27,000 as assumed by him. He defended the figure of 0·1d. per unit for battery charging, as this should only represent the actual works cost, and no addition should be made for capital charges. With regard to the proportion of peak load to be taken by the battery, he had taken 50 per cent., but was prepared to admit that this was on the large side.

In some further remarks Mr. Taylor made the following *resumé* to the possibilities which he claimed for batteries as applied to power companies' areas:—

(1) Double the radius of the transmission by employing storage without increasing capital cost per kw.

(2) Quadruple the area fed, and the capacity of the generating station (say, from 5,000 to 20,000 kw.).

(3) Save thereby, according to Mr. Addenbrooke's recent estimates, £9 per kw. in capital cost (excluding distribution), and an annual sum of £1 10s. per kilowatt, or, capitalised, an extra £15 per kilowatt; total = £24 per kilowatt saved, and available to pay for cells (nearly twice over).

(4) Save in fixed charges, due to the avoidance of a peak at the generating station, £2 to £2 10s. per kilowatt per annum, or enough to pay for maintenance and depreciation of cells nearly twice over.

Arbitration in Municipal Tramway Contracts.—The case of Messrs. R. W. Blackwell & Co. *v.* the Corporation of Derby came before Lord Justice Kennedy and Mr. Justice Joyce in the Court of Appeal on Thursday. The appeal was made by Messrs. Blackwell & Co. against an order of Mr. Justice Bucknill staying the action brought by them against the Corporation, on the ground of an arbitration clause in the agreement between the parties. This agreement related to a contract for the construction of a tramway in Derby, and the clause in question referred all disputes to the borough engineer of the Corporation. The engineer had certified for certain penalties due to delay in completion of the work, and the company had sued for the balance due under the contract, alleging that the delay was caused entirely by the borough engineer himself. Lord Justice Kennedy said that as the case raised the same questions as those now being considered in the case of W. Kennedy, Ltd. *v.* the Corporation of Barrow-in-Furness, he would suggest that the present case should stand over till after judgment had been delivered in that case, and this was agreed upon.

Proposed Water Power Station in Natal.—The following particulars of a scheme for utilising the power of the Umgeni River falls are taken from the *African World*. Concessions of land and the right to divert a certain quantity of water have been secured by the Howick Falls Development Syndicate, and the capital for this purpose has been subscribed locally. A dam will be constructed a short distance above the falls, and at a point about 100 feet from the falls on the south side of the river, a 310-ft. shaft will be sunk, the bottom of which will be a few feet above the level of the basin. The power-house, 20 ft. high by 20 ft. wide, and 200 ft. long, will be at the bottom of the shaft, and will contain five Pelton-wheel sets, two 450-h.p. sets, two 900-h.p. sets, and one 1,800-h.p. set. An overhead line will convey the electrical energy generated to the various consumers, the most important of whom will be a large blanket factory near the falls. It is possible that the works, if carried through, will supply energy for power and lighting to the town of Maritzburg, which is about ten miles distant. At present the town has a generating plant of its own. It is intended to float a company with a capital of about £60,000, to work the concessions.

EARTH CURRENTS FROM ELECTRIC TRAMWAYS

At the Manchester Section of the Institution of Electrical Engineers on Tuesday last week, Messrs. J. G. and R. G. Cunliffe read a Paper on "Electric Traction Vagabond Currents." The authors, who are students of the Institution, are engaged in the electrical department of the Manchester Corporation tramways. The Paper, the authors explained, is the outcome of an experimental investigation, chiefly directed to the elucidation of the reasons for the non-fulfilment of the early predictions of electrolytic destruction by tramway return currents. With a view to the exact determination of the conducting paths in the earth, a great number of measurements of earth potentials were made between plates of equal size buried in the earth. With plates 10 ft. apart, it was found that practically the whole of the potential drop occurred within a distance of 3 ft. of the two plates, there being hardly any potential gradient in the remaining space. This is shown in Fig. 1.

This 3-ft. limit the authors have found to be independent of size of plates, and they have obtained the same result from the track itself. It is also unaffected by the nature of the soil, provided this is homogeneous over a distance of 3 ft. round the rails in every direction. Another series of tests carried out upon rails having pipes at various distances away showed that no appreciable current entered the pipe even at a distance of 1 ft., provided there was no connection between the pipe and the rail.

Fig. 2 was traced from actual measurements of current in the rails of a double track, with a current of 300 amperes entering at a distance of 9,000 ft. from the negative feed-point. The tests were made on the Manchester tramway track at midnight.

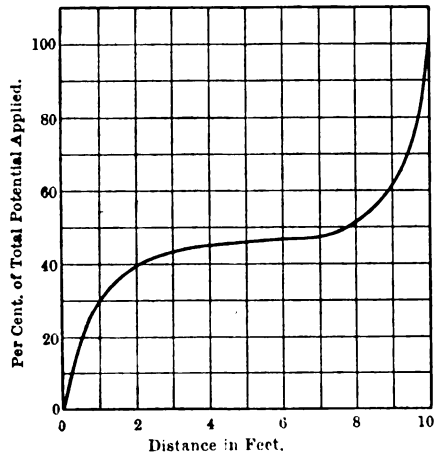

Fig. 1.—Potential Gradients between Earth Plates of Equal Area, 10 ft. apart.

Such heavy leakage currents are not a normal occurrence in Manchester, as four sections had to be connected in series in order to obtain them, and the rail drop was 5·4 volts, whereas the maximum value obtained in normal working is 2·0 volts; but, the authors added, on many other tramway systems the rail drop exceeds 5·4 volts, and the leakage currents must be extremely heavy. Claude (*L'Eclairage Electrique*, July 28th, 1900) found 12 to 15 per cent. of the total current to be "vagabond" on complicated networks, and 25 to 30 per cent. on long lines, whilst Parshall (*Institution of Electrical Engineers*, April 28th, 1898) found that on a line 8 miles long the "vagabond" current was as high as 60 per cent. of the total. Neither Claude nor Parshall could find any appreciable current flowing in the pipes, and a most careful search of the Manchester system affords no evidence of such currents.

From the experiments described in the Paper, the authors conclude that, after overcoming the resistance due to "bunching" of the current stream lines, encountered within 3 ft. of the rails, the current has become diffused over such a wide area that practically no further resistance is opposed to its flow—that is, a pipe situated over 3 ft. from the rails would carry little more current than if made of earth, and the majority of pipes are at a greater distance than this. Whatever current does, from any cause, enter the pipe must do so with a very low density, and at a distance from the point at which it leaves the rails, and must leave with a low density at a distance from the negative feed-point, owing to the lower resistance of a long return path than of a short one. This all follows from considerations of the high specific resistance of the soil, and only in case of soil possessing a very high conductivity is there any danger of corrosion of the pipe; even in such a case, if the rail drop is kept sufficiently low, the resistance of the pipe itself will prevent the flow of a heavy current.

If the pipe be connected to the rail, it acts as a large earth plate, and a heavier current flows along it. By making a temporary connection between pipe and rail at the negative feed-point, the authors have measured a current of 1·5 amperes flowing in the pipe, whereas no current could be measured before making the connection. The total vagabond current of

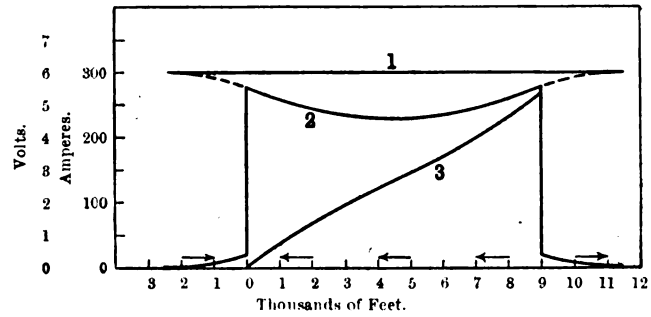

Fig. 2.—Current and Potential Distribution in Uninsulated Return.

Curve 1. Total Current.
,, 2. Actual Current in Rail.
,, 3. Volts Drop.

the section in this case was only 7 amperes, so that it represented 21 per cent. of the total. On longer sections a much heavier current would be obtained.

The authors next referred to the "electrolytic surveys" made by many waterworks engineers to judge the safety or danger of their pipe systems by the potential by which they are positive with respect to the rails in the danger zone. This they characterised as misleading, as the higher such potential with a given rail drop, the safer are the pipes, whereas high potential is accepted as a sign of danger. This view they explained by reference to Fig. 3. In order that no current may flow in the pipe, it is essential that there should be no drop of potential along the pipe, *i.e.*, that $e_2=0$. But $e_1+e_2+e_3=E$; therefore, for safety, we must have $e_1+e_3=E$. Further, if there is no drop along it, the pipe must be throughout at the potential of normal earth, *i.e.*, at the same potential as the neutral-point 0. Hence, the safety condition is, that $e_1=e_0$, and $e_3=E_0$, and these are the maximum possible values of e_1 and e_3. It is, therefore, impossible, they said, to judge of the safety or danger of a pipe from a knowledge of one potential difference only; there must be three simultaneous readings, and in all cases where there is doubt, the values of E, e_1, and e_3 should be measured, with a constant current flowing, and compared.

In the last section of the Paper, the authors acknowledge that the 7-volt limit of rail drop, imposed by the Board of Trade Tramway Regulations, accounts for the immunity from electrolysis in this country. They suggest, however, that the regu-

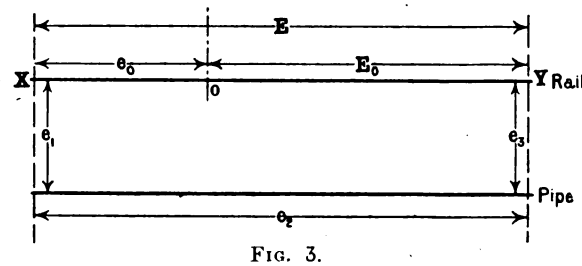

Fig. 3.

lation providing that the uninsulated return shall be connected to the negative pole of the generator, is unnecessary. This rule, they say, is based upon American practice, and was first suggested by Mr. Pearson, the engineer of the West End Railway Co., Boston, the object being to bring the danger zone close to the station and to run copper bonds from the negative busbar to the lead sheathing of the cables. As the latter is not the practice in this country, the authors think that there is no advantage in having the rails negative, whilst, on the other hand, if the matter were left to the discretion of the engineer, he could, by making them either positive or negative, as required, shift the danger zone if necessary to avoid bad soil, so evading the only danger condition to be feared.

Digitized by Google

They also criticise the Regulation 5 requiring the provision of two earth plates at each negative feed-point, and limiting the permissible resistance between these plates to 2 ohms. They also take exception to the Regulation 6, "which provides that no pipe shall be positive to the rail by more than 1 volt, nor negative to the rail by more than 3 volts," saying that it is preferable that the sum of these potentials should equal the rail drop, so that if the latter is allowed to amount to 7 volts, the above limits are too low.

In a concluding note they point to the danger of damage from earth currents at car-sheds. The modern car-shed is a structure of concrete and steel, the rails being supported on steel stanchions sunk in the concrete floor, whilst a complex network of metal pipes is required in order to supply and take away the large quantities of water required for car-washing purposes. The concrete is continuously wet, and any damage to piping embedded in it would be very costly to repair.

That there is danger is shown by a case which has recently come under the authors' notice in which a lead service pipe, which was in contact with the steel stringer girder, supporting the raised concrete floor between two bays, failed, and careful examination of the affected part showed the failure to be due to fusion by the passage of a heavy current from the rails to the pipe, the rails being positive to the pipe by 0·1 volt. In order to safeguard the piping, it is preferable that there should be a negative feed-point outside the shed, the section containing the shed being made as short as possible.

Mr. A. P. TROTTER was the chief contributor to the discussion, speaking in his individual capacity and not as electrical adviser to the Board of Trade. He said that he had made a study of the subject himself for 13 years, and he was able to congratulate the authors on the excellent mixture of theory and practice which their Paper displayed. Hitherto the theoretical men had been helping the waterworks and the practical men the tramways. He reminded the meeting that the Board of Trade regulations had been drawn up by his predecessor, Major Cardew, some fifteen years ago, when there were only a few miles of tramway in the country, and after conferences with the waterworks, gasworks, and tramways people; and it must have been a sort of inspiration that had led Major Cardew to fix on these figures, which had given adequate protection to the pipes, and had done little to harm the tramways. The authors' suggestion that no electrolysis need be feared at a greater distance than 3 ft. from the rail had been borne out by experience. Recently, said Mr. Trotter, he had been told by Mr. Hancock, electrical adviser to the Government of Western Australia, that he had a simpler rule to the effect that no pipe should come within 2 ft. of the rail; this was based on experience, and was the only regulation about electrolysis made by the Government of Western Australia. Those who wished to prove that electrolysis had been produced from tramway earth currents, had produced corroded pipes on nine different occasions in the Parliamentary Committee Rooms, three pipes each produced three times, and in all three cases the Board of Trade limits had been exceeded. There was not a single instance within his recollection in which pipes had been corroded when the Board of Trade regulations had been complied with, and tests carried out, except, of course, in the case of the tramway's own lead-covered cables, but that was their own affair. When he had investigated the disturbance of submarine cables by the Capetown tramways, he had taken out the fish-plates and bonds in the middle of a seven-mile track, cleaned the faces, and put in an amateur shunt. Three or four tramcars were put at the far end of the line with the brakes hard down, and they measured the current at the end and at the middle; there was about 70 per cent. going through to the rail. If the Thury high-pressure continuous-current system with earth return were to come in vogue for long-distance transmission, it would be necessary to make a thorough study of the subject, and he recommended those about to do so to read the chapter on the earth returns in Oliver Heaviside's first volume of "Electromagnetic Theory"; this chapter, he added, was not difficult reading. In conclusion, he pointed out that the authors were wrong to condemn altogether the connection of pipes to rails, and to belittle the importance of electrolytic surveys. There were scores of cases in which bonding had been put in, and incipient electrolysis stopped. In their Paper the authors had assumed that the pipes were exactly parallel to the rails, which, of course, is never the case. It is frequently necessary to bond pipes to the rails to let the current out by this means instead of through the earth, and electrolytic surveys might be of considerable utility.

Mr. J. S. PECK (British Westinghouse Co.) said that he had a number of bits of "vagabond" currents from single-phase railroads, which showed that the current spread over a tremendous area. There was practically no electrolytic corrosion, although they had experienced telephone troubles. A way of overcoming this, due to Mr. Scott, of the Westinghouse Co., is to run an auxiliary wire parallel to the telephone wire and with both ends earthed. At each end of this wire is a transformer, the other windings of which are so connected to the telephone circuit that the inductive effects are neutralised. This device is used on the New York, New Haven and Hartford line. Referring to the Board of Trade regulations, he said that, drawing an analogy with the case in which too high a factor of safety is chosen, resulting in a more expensive design than necessary, if there were no cases of electrolysis at all it was evident that the regulations were too strict.

Mr. S. L. PEARCE (City Electrical Engineer, Manchester) said that in Manchester greater use is made of the insulated return than in any other system in the country. Half-inch positive and negative feeders are run to every feeding point. This has the additional advantage that, in the event of the positive breaking down, the negative feeder can be employed in place of it, or if a heavier feeder is required, owing to changed conditions of traffic, the two can be used in parallel as a positive feeder, and a new negative feeder can be run whenever there is a spare duct available. The proposal of changing over the connection of the trolley wire from positive to negative would not be feasible, if only for the reason that the switchboard and feeder pillar connections would not be suitable for this.

A number of other speakers took part in the discussion, which was continued until a late hour.

Mr. WATTS (National Telephone Co.), in a written communication, drew attention to the authors' mistake in referring to three volts and one volt as the permissible limit to which the rails may be positive and negative to a pipe. The actual voltage in the regulation in question is that required to reverse three or one Leclanché cells, that is to say, roughly, 4½ or 1½ volts.

The AUTHORS, in the course of their reply, referred to the connection of negative feeders. They recommended that these should be connected to the two middle rails of the four, leaving the connection to the other two rails to be made by the next cross bonds in the ordinary course.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

IN *Electrochemical and Metallurgical Industry* of March the interesting and highly important announcement is made that the United States Steel Corporation have decided to adopt the Héroult electric furnace for refining steel at two of its plants at South Chicago, the works of the Illinois Steel Company, and at the Washburn and Moern works at Worster, the works of the American Steel and Wire Company. At the South Chicago works the Héroult furnace will be employed for refining liquid steel taken direct from Bessemer converters to prepare high-grade steel for rails and high-grade steel for axle and car-wheels. At the Worcester works the electric furnace will be used to refine liquid steel taken from two 50-ton open-hearth furnaces to make high-grade wires, *e.g.*, low carbon telegraph wires. The furnaces are to be 15-ton Héroult furnaces, which are the largest electric furnaces which have ever been made. The largest at present in use are the 8-ton Roechling-Rodenhauser ones in Germany. From experience with other electric furnaces the time for finishing a charge will probably not be more than one hour; the output per furnace will, in twenty-four hours, therefore, be between 500 and 350 tons. Another Héroult furnace of the same size will probably be erected at Homestead. If satisfactory results are obtained with these furnaces, it is intended to erect 30-ton furnaces, and possibly ones of even greater capacity. The construction of the furnaces at South Chicago and Worcester are to be actively pushed on, and it is hoped that both plants will be in operation in about three months' time. These furnaces are three times larger than any Héroult furnace at present employed, and, as already mentioned, seven tons greater capacity than the largest Roechling-Rodenhauser furnace. The "American Steel Masters have waited till all the little details and problems had been worked out in Europe and the tedious experimental stage passed. Now they are going into the matter not in a half-hearted way, but on a scale untried in Europe. The United States Steel Corporation becomes the daring pioneer of the *big* electric steel furnace." *Characteristically American, but hardly inventive.*

Japan, it is stated, is now able to supply all the calcium carbide required for her home consumption, which is estimated at 90,000 kilogrammes per month. A new power station has been erected by a company, with a capital of £60,000, on the falls of the Soki, near Kagoshima, where water-power capable of generating 10,000 h.p. is available. There are two qualities of carbide manufactured in Japan, the better grade costing about 1·85d. per pound, and the inferior grade, which is useless for lighting purposes, ¾d. per pound. It is contemplated enlarging the works in order to manufacture calcium carbide for export.

Strike of Paris Hotel Electricians.—The authorities of the Hotel Continental, which, it will be remembered, was put in darkness for a short period by the electricians in consequence of the refusal of a demand for higher wages, are bringing an action against M. Pataud, the secretary of the Electricians' Trade Union, who instigated the act. M. Pataud attended a meeting of the Post Office employees on Saturday, urged them to continue their agitation, and promised the co-operation of the Electricians' Union.

AMENDMENT OF THE ELECTRIC LIGHTING ACTS

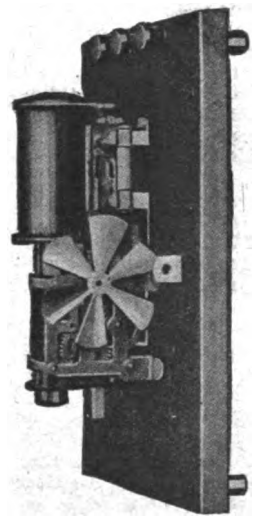
THE Board of Trade has issued the text of a Bill entitled "Electric Lighting Acts (Amendment) Bill," which in substance is the same as the "Supply of Electricity Bill," which was introduced on several occasions by the Government last in power, but which was not proceeded with owing to lack of time. The introduction of this Bill was primarily due to the facts placed before Mr. Gerald Balfour, the then President of the Board of Trade, in 1902, by a deputation from the Institution of Electrical Engineers, headed by Mr. James Swinburne, who was President of the Institution in that year.

It is well known that under the Electric Lighting Act, 1882, the Board of Trade has power to make Provisional Orders enabling local authorities, companies, or persons to supply electricity for public or private purposes, and that such Provisional Orders have to be confirmed by Parliament. By the practice of Parliament, promoters are not allowed to proceed by Bill for electricity powers in cases where they can proceed by Provisional Order. There are cases, however, in which promoters are obliged to proceed by Bill, because they are seeking for powers (such as the power to purchase land compulsorily or to supply energy in bulk) which the Board of Trade cannot confer by a Provisional Order under the present Acts. So, too, a Provisional Order cannot be granted on the joint application of two or more local authorities.

In 1898 a Joint Committee of the two Houses of Parliament was appointed to consider the general principles of certain Bills which had been promoted for authorising certain large electric power schemes. In 1904 a Bill was introduced by the Government for the purpose of giving effect to certain recommendations of the Joint Committee, and for removing certain difficulties which have been experienced in the working of the Electric Lighting Acts. The Bill was considered and amended by a Select Committee of the House of Lords, presided over by Lord Wolverton, and clauses 1, 2, 3, 6, 7, 8, 9, 10, 11, 14, 19, and 22 of the present Bill are substantially identical with provisions contained in the Bill of 1904 as so amended. When the Bill of 1904 left Committee it was agreed to by all parties, but it did not, for the reason stated above, reach the House of Commons. The other provisions of the present Bill are for the purpose either of generalising provisions usually inserted in local Acts dealing with electric supply or of removing certain further difficulties which have been experienced in the working of the Electric Lighting Acts.

The Bill now published empowers the Board of Trade to grant provisional orders for all the purposes related below, although it may be pointed out that, owing to this Bill having been shelved for so many sessions in succession, a very large number of supply authorities have been compelled, in the meantime, to proceed by private Bill to obtain the facilities granted by the greater number of the clauses. Whilst, however, certain clauses of the Bill will have no interest to such authorities, there are others which will have the effect of removing difficulties now experienced by all electric supply undertakers throughout the United Kingdom.

Most of the clauses may be summarised briefly: Clause 1 relates to the compulsory purchase of land for the purpose of erecting generating stations, and this is of interest in relation to actions for liability for nuisance arising from the working of power-stations. Clause 2 empowers the granting of provisional orders, authorising the breaking up of streets outside the area of supply, and Clause 3 permits of the supply of electrical energy in bulk between various authorised undertakers; but the Board of Trade may direct that, owing to the magnitude of the proposed undertaking, the matter ought to be dealt with by a private Bill. Clauses 4 and 5 provide for supply to railways, tramways, and canals partly outside the area of supply, and to premises outside the area of supply respectively.



The local authority of a district supplied from a generating station outside that district is given power in Clause 6 to purchase the generating station, but this will not apply to any generating station, &c., authorised prior to the passing of the present Act. In Claim 7, the Board of Trade takes power, with the concurrence of the Local Government Board, to grant provisional orders to a number of authorities for working electricity undertakings. The period at which a revision of prices may now be claimed under the Electric Lighting (Clauses) Act, 1899, is reduced from seven to five years in Clause 9, and the right is now given to 20 consumers to make an application for revision in addition to either the local authority or the undertakers. Under Clause 10 the subsections of the Electric Lighting (Clauses) Act, 1899, with regard to certification of meters, are substituted by new clauses, under which the Board has to approve of the manner of fixing meters, and also prescribes the limits of error between which the meter may work.

Under Clause 11 the accounts of all municipal electric supply undertakings are to be made up to March 31st each year. Other dates are permissible, however, where the circumstances demand. Section 12 lays it down that the Board of Trade may enforce upon electric supply companies compliance with any recommendations of the auditor appointed by the Board, there being an appeal to the Railway and Canal Commissioners. Failing compliance with any such order, action may be taken before a magistrate, the penalty being £10, and a fine not exceeding £5 per day on which the offence is continued after conviction. The transfer of any electric supply powers is restricted in Clause 13 to the conditions attaching to the grant of the powers. Clause 14 is the usual "standby" supply clause, and Clause 15 authorises the hiring out of fittings and motors by local authorities, but separate accounts are to be kept of this portion of the undertaking. Under Clause 16 consumers must give 24 hours' notice of removal. Power to refuse to supply in cases of arrears of accounts, &c., is given in Clause 17. Clause 18 is interesting in view of the recent action by the Inland Revenue Commissioners against the County of Durham Electrical Power Distribution Co., for it exempts agreements for electricity supply from stamp duty. To remove all doubts on the question, Clause 19 specifically states that the sections of the existing Acts relating to the association of undertakers do not prohibit "bulk" supply between them. Clauses are inserted for the protection of the Commissioner of Works, County Councils, and gas undertakers.

The Bill, when it becomes law, will apply to both Scotland and Ireland, as well as to England and Wales.

STAIRCASE LIGHTING SWITCH

AN automatic time-switch, designed for use in halls and on staircases of large flats and hotels in order to prevent waste of light after usual hours, has just been put on the market by the Electrical Co., Ltd., of Charing Cross Road, London, W.C. As shown by the accompanying illustration, the apparatus comprises a clockwork gear interconnected with the switch and an electro-magnetic attachment. It may be operated automatically by a door switch or by one or more push-buttons. A change-over switch is usually provided to allow of the lights being on continuously on to, say, 10 p.m. After that time the switch is put on to the "night" position with all lights out. On opening the door, or by pressing the button, the lights are switched on, and remain burning for about 1½ minutes, sufficient for one to reach the top floor, for instance. After this time, the device automatically switches off. A further pressing of the button causes the switch to repeat its action. The period of lighting can be prolonged if the button is re-pressed shortly before the device switches off. As a push-button may be used on each floor or at different positions along the corridor, the device may be used when on the stairs or from any other point in the house. The device can be obtained for either direct- or alternating-current circuits up to 250 volts.

AUTOMATIC SWITCH FOR STAIRCASE OR HALL LIGHTING.

Rating of Tramways.—The appeal in the matter of the rating of the Blackpool and Fleetwood Tramroad Co. has now reached the House of Lords. The company claims to be assessed on the basis of a railway, viz., one-fourth the rateable value, their line being on private lands. The Quarter Sessions and the King's Bench Division decided against the company, but the Appeal Court decided in their favour. Judgment in the House of Lords has been reserved.

Digitized by Google

LOCAL NOTES

ABERAVON: *Provisional Order Revoked.*—The Board of Trade has revoked the Electric Lighting Provisional Order granted to the Council in 1901.

ABERDARE: *L.G.B. Inquiry.*—The adjourned inquiry into an application by the Council for a loan, which was to have been held last week, was postponed, and no further date has yet been fixed.

ABERDEEN: *Charges for Light and Power.*—The sub-committee which has been appointed to consider the desirability of re-arranging the charges for electric light and power recommend that Sir Alexander Kennedy should be consulted. The Electricity Committee, however, after considering some statistics prepared by the City Electrical Engineer, have decided to hold a further meeting to discuss the sub-committee's recommendation.

ACTON: *The Electricity Undertaking.*—An important letter was received by the Council on March 11th from the Metropolitan Electric Supply Co., with reference to the negotiations which have been going on for some time past in regard to leasing the electricity undertaking. A few days before a resolution had been passed by the Council, by seven votes to six, that the undertaking be leased to the company for 37 years. The principal conditions put forward by the company are as follows :—The company to pay to the Council from time to time such sums as will be necessary to enable the Council to pay the instalments of the principal and interests as they fall due on the existing loans of £68,698. The company to provide all additional capital required from time to time for development and extending the undertaking, such capital to be repaid by the Council on the determination of the contract, less 1¼ per cent. per annum, calculated from the end of each year, in which the capital was expended. The company not to expend any capital during the last three years of the contract other than what may be necessary to connect new customers without the previous consent of the Council. The Council to take not less than 180,000 units per annum for street lighting at 1d. per unit, given during the usual burning hours for such purposes, such price to be subject to revision every ten years on arbitration terms, failing agreement, or (in the option of the Council) at an annual charge per lamp, to include maintenance and attendance, based upon the price for energy at the time being in operation. The Council desired the company to undertake (1) not to increase the present charges to private consumers and shops; (2) to supply electricity for lighting public buildings, including all schools under the District Council, at not more than 3d. per unit; (3) not to charge more than 1d. per unit for street lighting, including cost of maintenance, attendance, &c.; (4) not to charge more than 1d. per unit for power, including the supply to the sewage works; (5) not to charge anything to capital account unless sanctioned by the Council. In the company's reply, received on March 11th, willingness was expressed to submit to arbitration any question which may arise in regard to new capital expenditure. As to the prices to be charged for current, the company is willing to supply the Council with light for public buildings at 4d. per unit, but thinks it should be free to make its own terms with private consumers. At its last meeting the Council adopted a recommendation to adopt the proposition, subject to the company not increasing the rates to consumers.

ASPULL: *Transfer of Lighting Order.*—An application has been made to the Board of Trade for sanction to transfer the Council's Electric Lighting Order of 1901 to the Lancashire Electric Power Co. The sum of £250 is to be paid by the company to the Council to cover the expenses incidental to obtaining the order.

AUSTRALIA: *Adelaide: Tramways.*—The new tramway system, which is under the management of a municipal trust, was opened last week.

BARNES: *Street Lighting.*—All electric public lamps fitted with the Nernst burners in main thoroughfares and important positions are to be replaced by 100-c.p. metallic filament lamps.

BRADFORD: *Power Supply.*—Mr. T. Roles, the City Electrical Engineer, gave a lecture last week before the Bradford Liberal Club on "Modern Methods of Electrical Power Production and their Effect on the Price of Electricity." Mr. Rolls remarked that a large number of industrial firms, especially in connection with large mills and factories, had in the past preferred to generate their own electrical energy, but of late years the tendency had been very marked for such concerns to obtain their energy from the public supply mains. In fact, power supply from a central source might be regarded as a co-operative movement among manufacturers. So far as the Bradford Corporation was concerned, there was no reason why they should not give as cheap a supply as any company, but the business must be carried out on power company lines, and it must be recognised that power supply on a large scale was on altogether different lines from that for lighting and tramway purposes. The cost of the mains and plant put down to supply the small consumer averaged £91 per kw., whereas for the large power consumer the plant and mains might be put down at £20 per kilowatt. Therefore, by giving low rates to large power consumers, no injustice was done to the small consumer or to the Tramways Department, which must have continuous current.

BRAY: *Electricity Works Profits.*—The accounts of the electricity undertaking for the past year show a profit of £120.

BRIERFIELD: *Tramways.*—The Tramways Committee have appointed a sub-committee to meet the Burnley Corporation and Nelson Corporation, with regard to the electric tramways rental agreement, which expires on March 31st.

BRIGHTON: *The Power Station Plant.*—Mr. John Christie, the Engineer and Manager of the Electricity Undertaking, has presented a report in which he deals with the prospects of further capital expenditure on the assumption that the general policy is, as he imagines, to run the whole of the supply from Southwick, and finally shut down the North Road steam station. In addition to the expenditure of £15,370 recently decided upon for boiler equipment at Southwick, it is now necessary, he says, to have a second 300-kw. motor generator set installed, the estimated cost of which he puts at £1,500. In the spring of 1910 it will most probably be necessary to order a fifth turbo-generator at an estimated cost of £12,500. Further, additional transformer plant will be necessary at the North Road station, and he recommends that the most economical way will be to utilise the existing generators, but to dispose of the old Williams engines and mount the generators in pairs on a new bed plate, together with a 1,300–1,500 h.p. induction motor, as has already been done with one set, thus forming useful transforming units of 880-kw. capacity. It may be necessary to order one set at the end of the 1909 winter's load, and the second set at the beginning of 1912. The estimated cost of providing this plant with the necessary switchboard is put at £2,750 for the first set and £2,500 for the second set. With regard to mains, Mr. Christie states that the unspent balance of the special loans sanctioned in January, 1907, should provide sufficient margin for this during the next two or three years.

BURSLEM: *Assessment of Electricity Works.*—The electricity works and refuse destructor have been assessed at £2,270 gross rental and £1,180 rateable value, and the Town Clerk has been instructed to give notice of appeal against this assessment.

CARDIFF: *The Tramway Track.*—At a meeting held last week, a resolution authorising the Tramways Committee to call in an expert to examine the tramway track was carried. The mover of the resolution pointed out that he did not intend it to reflect upon Mr. Arthur Ellis, the Electrical Engineer and Tramways Manager, nor upon Mr. Harpur, the City Engineer, for whom he had the greatest respect.

COLCHESTER: *Supply from Tramway Wires.*—It was originally intended to erect an overhead wire to supply the Hythe Quay district, but after considering several schemes the Corporation have decided to take the supply from the tramway trolley wires to a sub-station, fitted with a motor-generator and Tirrill regulator. Mr. A. R. Sillar, Corporation Electrical Engineer, estimates that this scheme will cost considerably less than an overhead cable.

DARLINGTON: *Tramway Estimates.*—The estimated expenditure upon the tramways for the next financial year involves a charge upon the rates amounting to £2,092, against £1,548 for the financial year just ending. This increase is due to an estimated reduction in the receipts, and the net loss upon the undertaking is put at £1,092. The committee allow £1,000 for depreciation.

DUBLIN: *Port Electrical Equipment.*—The report for 1908 of the Dublin Port and Docks Board shows that during the year the sum of £7,886 was expended upon the electricity generating station, making a total expenditure to date of £40,297. In addition, electric wharf cranes were installed, having a value of £1,316.

DUNDEE: *The Trackless Trolley System.*—The sub-committee appointed by the Town Council to inquire into the use of the trackless trolley system has again reported in favour of an experimental equipment along the esplanade, at an estimated cost of £5,000. The manager of the tramways undertaking has expressed the opinion that the venture will be a financial success.

HORNSEY: *Electrical Exhibition.*—The Council's Electrical Engineer has urged the advisability of holding another electrical exhibition this spring.

HYTHE: *The Tramways Bill.*—The Council has decided to take a poll of the ratepayers in order to decide whether or not they shall oppose the Tramway Company's Bill, in which powers for the erection of overhead wires are sought.

LEITH: *Tramway Extension.*—A deputation from the Edinburgh Marine Gardens Co. waited upon the Tramways Committee of the Town Council last week, and asked for an extension of the tramways system to the Marine Gardens at Portobello. The committee are favourably disposed towards the proposal if satisfactory terms can be made with the Edinburgh Corporation, as at least half the proposed route is within the Edinburgh boundary.

LONDON: *London County Council: Chairman of the Highways Committee.*—Mr. A. Shirley Benn and Mr. A. Pownall

Digitized by Google

have been elected chairman and vice-chairman respectively of the Highways Committee for the ensuing year.

At the meeting of the Council on Tuesday, it was stated that a sub-committee was to witness some experiments upon the G.B. surface-contact tramways in the Mile End Road this evening.

Greenwich Power Station.—The Highways Committee report that two of the four 5,000-kw. turbo-generators required for the section portion of the Greenwich power station are now working, and the remaining two in course of erection. When these machines are all in operation, the power station will have a capacity of 34,000 kw. The first two machines have been erected at a cost of £43,195, and the second pair are being supplied for £40,800.

Hammersmith: Electricity Accounts.—When auditing the accounts of the Council's electricity undertaking for the year 1907-8, the District Auditor intimated that he would require the inclusion in each year's accounts of the proportion of all charges for principal and interest due to the end of the year, but not becoming payable until after the close of the year. This recommendation is in accordance with the requirements contained in the Report of the Departmental Committee which inquired into municipal accounts in 1907, and the District Auditor points out to the Council that all the other London boroughs owning electricity works have been treated in the same manner. The effect has been to charge the accounts for 1907-8 with an additional sum of £5,641 for principal and interest. The Electricity Committee point out that whilst this alteration will seriously affect the financial position of the undertaking in relation to its reserve fund, they are of the opinion that the District Auditor's requirements will place the accounts on a more satisfactory basis, and they recommend that these requirements be carried out.

Central London Railway Fares.—The Central London Railway is to adopt a system of fares involving a minimum of 1d. covering a distance of three stations. This change has been rendered necessary on account of motor'-bus competition.

NEWCASTLE: *Street Lighting.*—After considering reports from the general manager of the tramways and the lamp inspector, the Lighting and Tramways Sub-committee report in favour of retaining the electric arc lamps already in use, but to adopt gas for the extension of the lighting of the main roads.

NEWPORT: *Electricity Undertaking.*—A report has been submitted to the Electricity Committee, recommending the scrapping of the Llanarth Street Works and the installation of two new 2,000-kw. generating sets at the Corporation Road works. New offices for the electricity undertaking are also suggested, and the total cost of the scheme is estimated at from £68,000 to £75,000. The Electricity Committee favour the principle of the scheme, but have decided to call a special meeting to consider it.

SHEFFIELD: *The Proposed Tramway Extension.*—At the meeting of the Corporation last week the proposed tramway to Nether Edge was rejected on the recommendation of the Tramways Committee. An amendment to refer the question back to the committee was rejected.

SOOTHILL NETHER: *Overhead Wires.*—The Yorkshire Electric Power Co. have asked for the Council's consent to erect overhead wires in connection with the supply to Castleford.

SOUTH SHIELDS: *Dispute with Power Company.*—The Electricity Committee have now settled clauses with the County of Durham Electric Power Supply Co., with the result that their opposition to the company's Bill will be withdrawn.

SWINDON: *Electricity and Tramways Undertaking.*—The Electricity and Tramways Committee are to hold a special meeting to consider as to the working of the electricity and tramways undertaking in order to see if it is possible to further reduce the expenditure and increase the revenue.

WEST HAM: *Electricity Accounts.*—Mr. A. H. Seabrook, Electrical Engineer, and the Borough Treasurer, have agreed that for the year to March 31st next, there will be a net surplus of £3,000 upon the working of the electricity undertaking, compared with a loss of £4,600 last year. The number of units sold during the year amounted to fifteen and a quarter millions, an increase of four millions. The receipts were 1d. per unit against 1·25d. per unit in 1907-8, and the total working costs were 0·5d., compared with 0·75d. for the previous year.

Tramway Inter-communication.—Arrangements have now been completed for through running between the West Ham and East Ham tramway systems over Bow Bridge (London County Council boundary) to Ilford Broadway route.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—A number of new mains are to be laid, involving an expenditure of £2,076.

BRADFORD.—It has been decided to incur an expenditure of £9,726 for the provision of an electric power plant at the Bradford Technical College.

CARDIFF.—Tenders are invited for the supply and erection of switchboard, steam exhaust and circulating pipes, and the supply and laying of cables. Particulars from the City Electrical Engineer, and tenders by March 26th.

FIFE ELECTRIC POWER CO.—A considerable extension to the plant at the Townhill works is contemplated, as the present machinery is practically fully loaded. Extensions, it is stated, may go to the extent of double the present capacity.

LONDON: *Hammersmith.*—A loan of £9,468 for electric lighting purposes is recommended by the Finance Committee of the London County Council, subject to the repayment of a small sum outstanding in respect of a previous loan.

WOLVERHAMPTON.—The Guardians invite tenders for the renewal of a storage battery and its maintenance. Particulars from the Clerk, Poor Law Offices, Wolverhampton.

Miscellaneous

BOLTON.—Tenders are invited for stores by the Electricity Committee for the ensuing twelve months, including meters, motors, and transformers, and motor starting switches. (See advertisement this week.)

BRIDLINGTON.—The Property Committee invite tenders for a scheme of illumination for the Royal Princes Parade not exceeding £500, the contractor to provide the scheme. Particulars from the Electrical Engineer to the Council, and tenders by March 30th.

BRISTOL.—Tenders are invited for stores for the ensuing twelve months, including coal supply at Avonbank and Temple Back, arc lamp carbons, &c. (See advertisement this week.)

COLOMBIA.—The *Board of Trade Journal*, quoting from a foreign exchange, states that the Compañia del Tranvia de Barranquilla has undertaken to substitute electric traction (overhead or underground system) for animal traction on all the tramways of the town of Barranquilla. In carrying out the work the Compañia will enjoy the privilege of importing, free of duty, all such materials as dynamos, cars, cables, machinery, tools, instruments, motors, cotton waste, electrical apparatus, &c.

DUBLIN.—The South Dublin Guardians have adopted a recommendation in favour of the electric lighting of the Union. The estimated expenditure for the installation is £3,500, and the cost of maintenance £300 per annum. These estimates show a saving of £500 per annum over the tender of the gas company.

EDINBURGH.—Tenders are invited for the supply, during the year beginning May 16th next, of bitumen, lead-covered paper-insulated cables, arc lamp carbons and globes, service boxes, meters, &c. Particulars from the City Electrical Engineer and tenders by March 29th.

GOVAN.—Tenders are invited by March 30th for stores for the Electricity Department ending May 15th, 1910. Particulars from the Borough Electrical Engineer.

LONDON: *Fulham.*—The Electricity Committee have had under consideration the lighting of Fulham Palace Road with metallic filament lamps attached to the tramway poles, in lieu of the present system of arc lighting, and have decided that eight poles, four on each side of the road, should be first fitted up as an experiment in a section of the road at a cost of £50.

Hackney.—The Borough Council invite tenders by April 22nd for open-type white arc lamp carbons and yellow flame arc lamp carbons. Particulars from the Borough Electrical Engineer. Tenders are also invited by May 6th for underground cables, boxes, frames, and covers; box compound and insulating oils and tapes; pitch compounds for filling troughs, earthenware troughing, tiles and cable supports.

NETHERLANDS.—The *Board of Trade Journal* states that a committee has been formed at Terneuzen with the object of bringing to a head an important tramway project of the company called the Yserdyksche Stoomtramwegmaatschappij. The plans provide for about 43½ miles of tramways. The same journal notifies that the town of Arnhem has arranged to take over from the concessionaire company the Velp line, which is going to be worked electrically. Inquiries in this connection should be addressed to the Communal Authorities of Arnhem. A project has also been formulated by M. Hartog, of Fauquemont, to link up the Limbourg Mines by a system of electric tramways. From Heerlen, the starting point, the lines would proceed as follows:—(1) Heerlen to Amstenrade and Sittard; (2) Heerlen to Valkenhuizen, Kerkrade and Valkenhuizen to Bovenste Locht; (3) Heerlen to Klimmen, Fauquemont, Groot-Welsden, and Margraten; (4) Gangelt to Schinveld, Merkelbeek, Amstenrade, Nuth, Schimmert, Ulestraten, Beek, and the Belgian frontier.

PANAMA.—H.M. Legation at Panama, says the *Board of Trade Journal*, report that the National Assembly has enacted a law authorising the Executive Power to expend up to £20,000 in the construction of telegraph lines in the Republic of Panama. The law also authorises the installation of telephone services between several of the towns, and the erection of wireless stations between Colon and Bocas del Toro.

Digitized by Google

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.W.—Tenders are invited for the electric wiring and fitting with bells and telephones of the St. John's Hill Divisional Office, Wandsworth. Particulars from the Clerk to the Council, and tenders by March 24th.

W.—Convent, Regent's Park. Romaine, Walker & Besant, architects, 6 Old Bond Street, W.

Park View Hotel, Lancaster Gate. Architect, Delissa Joseph, 73 Basinghall Street, E.C.

W.C.—Buildings, High Holborn. Architect, F. Foster, 41 Bedford Row, W.C.

PROVINCES.

BLACKBURN.—School, Bangor Street (£11,000). Architects, Cooper & Slater, Richmond Street, Blackburn.

BLACKPOOL.—Police station. J. S. Brodie, Town Hall, Blackpool.

BRIDLINGTON.—Additions to Girls' High School. Architect, E. R. Matthews, Bridlington.

BRISTOL.—New buildings at Southmead School of Industry for the Blind (£24,583). Architects, Edmeston & Gabriel, 42 Old Broad Street, London, E.C.

COLNE.—Chapel and school (£3,000). Architect, S. B. Bowen, Keighley Road, Colne.

DUNDEE.—Central reading room (£11,000). City Engineer, City Estate Office, Dundee.

DURHAM.—New block, Technical College. Architects, Oliver, Leeson & Wood, Newcastle-on-Tyne.

EALING.—Dispensary block, Matlock Lane, in connection with the new Ealing Hospital.

Clergy house of St. Saviour's, The Grove.

HEREFORD.—Extensions Shire Hall. Architect, R. A. Jack, Shire Hall, Hereford.

MANCHESTER.—Bank. Architects, Woodhouse & Dean, King Street, Manchester.

MANSFIELD, WOODHOUSE.—Public offices. Architect, F. Cook, Mansfield.

MELTON MOWBRAY.—Alterations and additions to cattle market (£2,903). Edmund Jeeves, Surveyor to District Council.

NELSON.—Council school (£3,930). D. P. Jones, architect to Cardiff County Council.

NELSON (LANCS.).—Post office. Architect, Mr. Ball, Town Hall, Nelson.

PRESTON.—Swimming baths. Borough Surveyor, Town Hall, Preston, Lancs.

RICHMOND.—Drill hall for the Surrey Territorial Force Association. Lieut.-General Sir E. R. Elles, Chairman.

SALFORD.—Tenders are invited for the re-wiring of the Royal Technical Institute. Particulars from Mr. V. A. H. M'Cowan, Borough Electrical Engineer, and tenders by 29th inst.

STRETFORD.—Additions Technical Institute. E. Worrall, architect, Stretford.

TOTTENHAM.—The Metropolitan Asylums Board invite tenders for the electric wiring of the North Eastern Fever Hospital, St. Ann's Road, Tottenham. Particulars from the Clerk to the Board, Victoria Embankment, and tenders by March 26th.

WALKDEN (MANCHESTER).—Electricity is to be adopted on a fairly extensive scale at Messrs. E. Lane & Sons, Hope Mills, Walkden, which have recently been considerably enlarged. Power will be supplied by the Lancashire Electric Power Co.

TENDERS RECEIVED AND ACCEPTED

ACTON.—The Council have accepted the following tenders for annual supplies for the electricity undertaking :—Steel tubing, Perfecta Tube Co.; meter-boards, Reason Manufacturing Co.; cables, St. Helens Cable Co.; fuse-boxes, W. Lucy & Co.; meters, Venner & Co.; assisted wiring, ordinary installations, C. G. Berry; special installations; J. H. Hewett and C. G. Berry; heating circuits, Park Bros.; bitumen, Callender's Cable & Construction Co.

BELFAST.—Tenders for tramway supplies and stores during the coming year have been received, and have been referred to a sub-committee.

BRADNINCH.—The tender of Messrs. Brooking, of Exeter, has been accepted for the wiring of the parish church.

CANADA.—Further contracts in connection with the Ontario Government Electric Power Scheme have been placed with the Canadian General Electric Co. and the Canadian Westinghouse Co. The tenders relate to the equipment of twelve transformer stations. The total amount of the above contracts is £154,000.

LOWESTOFT.—The tender of Messrs. W. T. Henley's Telegraph Works Co., Ltd., for house cut-outs at 3s. 10d. per pair has been accepted. Tenders for the supply of cable for the ensuing year have been received, but the engineer has been instructed to obtain further quotations.

The Electricity Committee have been empowered to enter into a contract for a 250-kw. generating set, tenders for which have been obtained.

LYME REGIS.—An agreement has been entered into with the Lyme Regis Electric Light Co., by which public electric lighting will be carried out for a period of seven years at a cost of £240 per annum.

LONDON: *London County Council.*—The following tenders have been received for two 1,500-kw. rotary converters at the Elephant and Castle sub-station :—Dick, Kerr & Co., Ltd., £4,274; Dick, Kerr and Co., Ltd. (alternative), £4,652; Electric Construction Co., Ltd., £4,319; British Thomson-Houston Co., Ltd., £4,490; General Electric Co., Ltd., £4,636; British Westinghouse Electric & Manufacturing Co., £5,601; Bruce, Peebles & Co., Ltd., £9,416. The tender of Messrs. Dick, Kerr & Co. is recommended for acceptance.

The following tenders have been received for high- and low-tension switchgear at the Elephant and Castle sub-station :—Spagnoletti, Ltd., £2,458; Johnson & Phillips, Ltd., £2,495; Switchgear Co., Ltd., £2,670; Whipp & Bourne, £2,731; Ferranti, Ltd., £2,746; British Westinghouse Electric & Manufacturing Co., £2,786; Electric Construction Co., Ltd., £3,057; Electric & Ordnance Accessories Co., Ltd., £5,982.

It is recommended that the tender of Messrs. Spagnoletti, Ltd., should be accepted.

The following tenders have been received for the supply of six static transformers at the Elephant and Castle sub-station :—British Electric Transformer Co., Ltd., £1,879; Dick, Kerr & Co., Ltd., £2,092; British Westinghouse Electric & Manufacturing Co., £2,112; General Electric Co., Ltd., £2,284; Electric Construction Co., Ltd., £2,427; British Thomson-Houston Co., Ltd., £2,716; W. E. Burnand & Co., £2,727.

The tender of the British Electric Transformer Co. is recommended for acceptance.

The following tenders have been received for an overhead travelling crane at the Elephant and Castle sub-station :—Holt & Willett, £265; Alexander Jack & Co., £268; James Spencer & Co., £290; John Smith (Keighley), £295; Pickerings, Ltd., £295; North British Lifting & Moving Appliance Co., £315; James Carrick & Sons, £315; Morley Electrical Engineering Co., £315; John M. Henderson & Co., £317; B. Johnson & Son, £330; Applebys, £333; S. H. Heywood & Co., £363; Carrick & Ritchie, £368; Carrick & Ritchie (alternative tender), £375; Chambers, Scott & Co., £370; S. Russell & Sons, £385; Chatteris Engineering Works Co., £396; George Anderson & Co. (1905), £450; Higginbottom & Mannock, £480.

The tender of Messrs. Holt & Willett is recommended for acceptance.

The following tenders have been received for the wiring and fitting for electric lighting of the Norwood car-shed :—Tredegar & Co., £706; G. E. Taylor & Co., £720; H. G. Whitehead, £739; Pinching & Walton, £758; Comyn, Ching & Co., Ltd., £778; E. Sheldrick & Co., £783; Chas. Pullan, £797; G. Weston & Sons, £809; Lund Bros. & Co., £920.

The tender of Messrs. Tredegar & Co. is recommended for acceptance.

The following tenders have been received for a forging and annealing furnace at the Central car depot :—Mountain & Gibson, Ltd., £128; Alldays & Onions, £134; Horsfall Destructor Co., Ltd., £172; Meldrum Brothers, £250.

The tender of Messrs. Mountain & Gibson is recommended for acceptance.

MAIDSTONE.—The following tenders have been received for a booster :—W. A. Stevens, Ltd., £118; General Electric Co., Ltd., £112 10s.; Electromotors, Ltd., £111 10s.; Bruce, Peebles & Co., Ltd., £102 10s.; British Westinghouse Co., Ltd., £99; Verity's, Ltd., £88. The tender of the latter firm has been accepted.

MANCHESTER.—The D. P. Battery Co., Ltd., have received an order from the Manchester Corporation for a storage battery with reversible booster and switchboard. The battery will consist of 240 cells of the company's T 15-plate type, and is to be erected at the Longdendale Waterworks for dealing with the fluctuating loads of their power installation. It is also to supply current for lighting at a distant point.

NEWCASTLE-UNDER-LYME.—An order has been placed with the Electrical Power Storage Co. for the supply and erection of two batteries at £275.

"ORIFLAMME" CONTRACTS.—Oliver Arc Lamp, Ltd., have recently secured orders or supplied lamps for street lighting in Hampstead, Leeds (extension), and Tottenham, and also from the Barry Railway, Great Western Railway (25-period alternating-current lamps), and H.M. Dockyards at Hong Kong and Sheerness (extension).

THE ADMIRALTY.—An order has been placed with the Consolidated Pneumatic Tool Co. for 300 electric drills at £50 each.

WAR OFFICE.—The Secretary of State for War has accepted the tender of Direct-Gas Fuel, Ltd., for four sets of the Gregory patent smoke-preventing apparatus, to be fitted at the power house, Enfield Lock.

PARLIAMENTARY INTELLIGENCE

FOLKESTONE, SANDGATE & HYTHE TRAMWAYS BILL.—We report in another column that the Hythe Council has decided to take a poll in order that the ratepayers may decide whether the National Electric Construction Co. shall be allowed without opposition to erect overhead wires, as proposed in their Bill. Captain Faber, the member for the Andover Division of Hampshire, has given notice that on the second reading of the Bill he will move that it be an instruction to the Committee to omit all powers for erecting overhead wires.

NORTH METROPOLITAN ELECTRIC POWER BILL.—This Bill was before a Committee of the House of Commons on Thursday, and was reported for third reading. The object of the Bill was to include the districts of Hendon, Finchley, Friern Barnet, Hornsey, Walthamstow, Chingford, and Waltham Holy Cross within what is known as the "special district," viz., that in which the company may supply to power consumers under the terms of the Kitson Clause. This company will be remembered as one which commenced operations as a "bulk" supply company to municipalities, a limitation which, it was realised, seriously handicapped its operations. In 1907 a Bill was passed which created a "special district," in which supply could be given as above stated, and the present Bill adds to the "special district." In fact, the districts now included were cut out in 1907 at the instance of the Board of Trade owing to the London County Council Power Bill. General powers are also taken in the Bill for the erection of overhead wires under the usual conditions, and for supply for traction purposes, whether with or without rails. The raising of additional capital is also authorised by the Bill. There was some opposition, but, as stated above, the preamble was found proved, subject to the company, where it wished to supply energy for lighting railway companies' premises in the area of an authorised distributor, should obtain the consent of that distributor. The Hendon Council was granted the veto as to whether or not the power company should supply in this district, subject to the usual appeal to the Board of Trade.

STANDING ORDERS.—The Torquay and Paignton Tramways Bill was before the Standing Orders Committee of the House of Lords last week for non-compliance with Standing Orders, the promoters not having obtained the consent of the Paignton Urban District Council. After some discussion, in which it was shown that the refusal of the Council to give its consent was that the company would not agree to their offer of 2d. per unit for energy, but were willing to pay 1½d. The committee decided to allow the Bill to proceed.

The Board of Trade London Electric Supply Bill, which provides for the acquisition, in 1931, by the London County Council of the Electric Supply Companies in the West End of London, was before the Examiner of Standing Orders last week, but has been referred to the Standing Orders Committee, owing to the notice of the Bill being beyond the statutory limit.

X-RAY DERMATITIS.—In answer to a question in the House of Commons last week, the Prime Minister stated that the case of Mr. H. W. Cox, who recently had several fingers amputated as the result of X-ray dermatitis, was receiving the consideration of the Government from the point of view of the grant of a Civil List pension.

SOMERSET ELECTRIC POWER BILL.—This Bill was before the Standing Orders Committee on Friday for alleged non-compliance with Standing Orders, by reason of the fact that the consent of the Bath Corporation had not been obtained on the ground that the notice of the intended application to Parliament for an extension of time, &c., was not published in the *London Gazette* and the local papers until one month after the statutory period for the publication of such notices. The committee decided that the Standing Orders had not been complied with, and the Bill will therefore have to be dropped for this session.

Electric Carriages in Hyde Park.—The announcement is made that licenses and badges will be issued for electrically-driven vehicles to pass through Hyde Park between the hours of 4 and 7 p.m. in the months of May, June, and July.

Correspondence Courses in Electrical Engineering.—We have received from the "University Engineering College," which is an institution of correspondence instruction having its headquarters at Stanstead Road, Forest Hill, a syllabus of their correspondence courses in electrical engineering, conducted by Mr. W. R. Harding. These courses have evidently been very carefully arranged, and cover respectively the following sections of the subject:—Elementary electrical engineering, electric light and power, central station practice, principles of the design of continuous- and alternating-current generators, electric wiring, electric power distribution, complete electrical engineering course, and electric traction. In conducting the courses suitable text-books are forwarded at the commencement of the course, together with instruction papers denoting what portions of the books are to be studied for each lesson, and question papers are set, the answers to which are worked out by the student and forwarded to the institution for correction and criticism.

MISCELLANEOUS CITY NOTES

CAMMELL, LAIRD & CO.—The directors have decided to pay no dividends on either class of shares, and no arrears on the preference shares for 1908, as the result of the year's working shows an adverse balance.

LIVERPOOL DISTRICT LIGHTING CO.—A final dividend of 1½ per cent., making 4 per cent. for the year, less tax, is recommended.

SHAWINIGAN WATER & POWER CO.—A dividend of 1 per cent. has been declared upon the ordinary shares for the quarter to March 31st.

ROSARIO ELECTRIC CO.—An interim dividend of 6 per cent. per annum, less income tax, is recommended upon the ordinary shares for the half-year to March 31st.

MIRRLEES WATSON CO.—A dividend of 5 per cent., free of income-tax, is recommended for 1908, transferring £1,250 to new tools account and carrying £1,251 forward.

BRITISH ENGINE BOILER & ELECTRICAL INSURANCE CO.—A dividend of 4s. 6d. per share and a bonus of 2s. per share, free of income-tax, for the past half-year, making 9s. 6d. per share for the year, is recommended. The sum of £8,000 is transferred to reserve account, £500 to writing off furniture and instruments, and £2,528 carried forward.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. Dimmack, the Chief Electrical Engineer to the Swindon Corporation, and his Chief Assistant Engineer recently made applications for increases of salary, but the Electricity and Tramways Committee have decided that the applications be not entertained.

The recommendation of the Rochdale Electricity Committee increasing the salary of Mr. C. C. Atchison, Borough Electrical Engineer, from £350 to £400 per annum, has been referred back.

Mr. G. A. Bruce, the Manager of the Lowestoft Corporation Tramways, has withdrawn his resignation.

Madame Curie has been appointed President of the Electricity Section of the International Chemistry Congress, which is to be held in London.

The Tunbridge Wells Corporation require a Resident Electrical Engineer (salary £300, rising to £400 per annum), and a Chief Assistant Electrical Engineer (salary £150 per annum, rising to £200). Applications to the Town Clerk by March 24th.

Mr. R. S. Pilcher, General Manager of the Aberdeen Corporation Tramways, was presented with a silver tea and coffee service last week on the occasion of his marriage.

Mr. A. G. Gardiner, of the Burton and Ashby Light Railway, has been appointed on the staff of the Isle of Thanet Lighting & Tramways Company, and Mr. D. J. Haining, another member of the engineering staff of the Burton and Ashby Light Railway, has been appointed Assistant Engineer to the Santa Cruz (Mexico) Electric Light & Power Co.

The General Purposes Committee of St. Pancras Borough Council have decided to pay Mr. A. E. Blanks, canvasser and consumers' advertiser, a salary of £200 per annum, instead of the salary and commission previously decided upon. Although 141 new subscribers were secured last year, owing to the use of metal filament lamps and other circumstances over which he had no control, Mr. Blanks' commission only amounted to about £4.

Telegraph Traffic and Movements of Cable Ships.—The submarine cable between Guernsey and Jersey ceased working on the 10th inst., and telegrams had to be sent *via* France. Repairs were effected on the 15th inst., however. On the same day (10th inst.) the submarine cable between Latakia and Cyprus was reopened to international communication. On March 11th the El Arich route was restored to working order, and on the 13th the submarine cable between Oran and Tangier was repaired. On the same day communication between Rome and Pera was interrupted, but repairs were effected on the 15th inst. The Indo-European Company's line is broken down near Tabriz, in Persia, and telegrams for places in that country must be sent *via* Turkey and Bushire or *via* Eastern-Bombay-Bushire. Telegrams for Djoulfa may, however, be sent *via* Indo. The French Cable Company's route to the West Indies has been partially restored by the repair of its cable between New York and Cape Haiti, but the sections to Dutch and French Guiana and Brazil are still *hors de combat*. No doubt the French company's repairing ship is now *en route* to undertake necessary repairs. The Central & South American Telegraph Company has laid a cable across the Isthmus of Panama, thus giving a better connection between the cables on the Pacific and Caribbean side of the Isthmus. The cable was manufactured by the Kerite Insulated Wire and Cable Company. The cable steamer *Mackay Bennett*, belonging to the Commercial Cable Company, has returned to Halifax, N.S., after an overhaul at New York. The repairing steamer of the West India and Panama Telegraph Company, the *Henry Holmes*, has gone to Trinidad to undergo some repairs.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net c.i.f. port of arrival, quoted on Tuesday night was £56 10s. to £57 per ton (last week, £58 10s. to £59).

AGENCY.—The Eureka Conduits and Fittings Co. have appointed Messrs. Hogan & Wardrop, of Gloucester Mansions, Cambridge Circus, agents for London and district for the sale of their conduits and fittings. A stock will still be maintained in London.

ENGINEERING INSTRUMENTS.—A petition will be heard on March 27th before Mr. Justice Swinfen Eady for a reduction of the capital of this company from £50,000 to £31,562 10s.

CRYPTO ELECTRICAL CO.—Owing to an increase in their business, the Crypto Electrical Company have been compelled to make a further considerable extension in their factory premises, and have secured a building adjoining their present factory, which will be reconstructed as an extension to the machine shop. This is the third extension during the last five years.

LONDON OFFICE.—Messrs. Barlow & Chidlaw, Ltd., makers of machine-cut gears, &c., Pendleton, Manchester, have opened a London office at St. Stephen's House, Westminster, London, S.W. Telephone number, Gerrard 881. Mr. H. J. W. Oxlade will represent the interests of the firm in London and the south-east district.

BRITISH WESTINGHOUSE CO. SUPPLY DEPARTMENT.—A branch office of the London Supply Department of the British Westinghouse Electric and Manufacturing Co., Ltd., has been opened at 27 Chancery Lane, W.C., in the showrooms connected with which is displayed a fine assortment of Westinghouse flame- and enclosed-arc lamps, metal- and carbon-filament lamps, electrical fittings, fans, conduits, cables, telephones, bells, small motors, accessories, &c. Inquirers for such electrical accessories should therefore substitute the above address for the old one, 2 Norfolk Street, W.C. The telephone number remains 3261 Gerrard, and the telegraphic address is "Westelec, London."

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A meeting of Reeds Electrical Co., Ltd., will be held at the offices of Messrs. Evans, Fripp, Deed & Co., 90 Cannon Street, London, E.C., on Monday next, at 3 p.m., to hear the liquidator's report of the winding up.

COMPANIES' MEETINGS AND REPORTS

LONDON UNITED TRAMWAYS.—An extraordinary general meeting was held on Tuesday, when the promotion of the Bill now before Parliament empowering the company to make variations in certain of their existing Parliamentary powers, and to run over certain tramways of the London County Council, with reciprocal powers over portions of the company's system to the County Council, was confirmed.

NEWCASTLE & DISTRICT ELECTRIC LIGHTING CO.—At the annual meeting on Thursday, the report and accounts given in our last issue were adopted.

BROMPTON & KENSINGTON ELECTRIC SUPPLY CO.—At the meeting on Thursday, the report and accounts, given in our last issue, were adopted. Mr. H. R. Beeton, the chairman of the company, who presided, referring to the fact that the profits on the past year's undertaking were £3,923 less than for the previous year, stated that this represented a diminution of £2,521 in receipts, and an increase of £1,402 in expenses. After making various corrections, however, the real deficiency in the receipts was £2,000, which was largely due to the absence of fog last year. The increase in expenses was due to the fact that they had charged the revenue of the year with all the alterations required by the new Home Office Regulations, and the whole of the Parliamentary expenditure, which also had been charged against revenue. With regard to the future, he pointed out that with the removal of the prospect of the wasteful, needless competition proposed by the "bulk supply" schemes, the London electric supply companies were now free to develop their undertakings to greater advantage than ever before. As to the use of metal filament lamps, he had no doubt that the electricity supply companies would be gainers by this invention, but there was much to be done both by the companies and their consumers if this latest improvement was to be beneficially and economically applied. Referring to the Daylight Saving Bill, he expressed the opinion that a reasonable readjustment of tariff might be fairly called for in the interests of those who had risked their capital under different conditions if this Bill were to become law.

YORK TRAMWAY CO.—The final meeting of the shareholders of this company was held last week, the corporation having now acquired the undertaking under the terms of the recent arbitration for £11,000. A resolution to place the company voluntarily into liquidation was passed.

CHELSEA ELECTRICITY SUPPLY CO.—At the annual meeting last week the report and accounts given in our last issue were adopted. Sir Irving Courtenay, the chairman of the company, who presided, said that in view of the trade depression of 1908 they did not look upon their results as unsatisfactory, as they were able to maintain the same dividend as last year after placing the proper amount to reserve. Although there were still a large number of "empties" in their district, they had succeeded in increasing the number of lamps installed by 10,375, and the number of units sold by 105,980.

OXFORD ELECTRIC CO.—At the annual meeting last week the report and accounts given in our last issue were adopted.

CARLISLE TRAMWAYS CO.—The annual meeting was held on Friday, when the report and accounts given in our last issue were adopted. The Chairman, in referring to the accounts, drew special attention to the deficiency of £163, brought about through their gross profits being £1,437, whereas the debenture interest amounted to £1,600. He quite admitted that the financial position of the company was a very bad one, and the directors had had the matter under their consideration for a long time. As the result, a scheme had been placed before them which showed every promise of turning the undertaking into a successful one, but as it had not received complete consideration he would not discuss the details of it. Mr. Barber Glenn stated that one of the reasons for the present position was that the receipts per car mile were only 7·27d., while the general average was between 9d. and 10d. He certainly thought the company was entitled to some consideration at the hands of the Corporation in the matter of the charge for electric current, the Corporation at present making something like cent. per cent. out of the company on this head.

COUNTY OF LONDON ELECTRIC SUPPLY CO.—At the annual general meeting on Monday, the report and accounts given in our last issue were adopted. Mr. J. B. Braithwaite, the chairman of the company, who presided, referring to the technical side of the business, said that the recommendation of their engineer with regard to the installation of Curtis turbines, of which they now had 10,000 kws. in operation, had proved entirely satisfactory. During 1908 five testing stations for recording the pressure of supply were equipped as required by the London County Council, and the tests taken from these stations had reported the pressure as being satisfactory. The total value in units had increased by 11 per cent. over the previous year, and it was interesting to notice that their output was almost exactly shared by lighting and power. There had been only a comparatively small increase in the units sold for lighting, due partly to the exceptionally light weather experienced during a portion of 1908, and also to the increasing use of metal filament lamps, but they were all agreed that in the long run this lamp would prove a benefactor to the electric lighting industry. With regard to the works costs, in spite of the fact that they had paid 4 per cent. more for coal, stood at 0·388d. per unit. The Chairman concluded his speech with some reference to the London Electric Supply Act.

COUNTY BOROUGH OF BOLTON.

ELECTRICITY COMMITTEE.

THE ELECTRICITY COMMITTEE of the County Borough of Bolton are prepared to receive Tenders for the following Materials and Stores, for the year ending March 31st, 1910:—

1. Lubricating Oils, &c.
2. Cleansing Waste, &c.
3. Joint Boxes, Service Fuse Boxes, &c.
4. Jointers' Stores, Mains, Sundries, &c.
5. Meters.
6. Motors and Transformers.
7. Motor Starting Switches.
8. Timber.

Specification and Form of Tender may be obtained on and after March 12th, 1909, on application to Mr. A. A. DAY, A.M.I.C.E., M.I.E.E., Borough Electrical Engineer, Spa Road, Bolton.

Tenders addressed to the Chairman of the Electricity Committee, Town Hall, Bolton, must be sealed and endorsed "Tender for——," and delivered not later than 12 o'clock noon on Thursday, March 25th, 1909.

The Committee do not bind themselves to accept the lowest or any Tender.

SAMUEL PARKER,
Town Clerk.

Town Hall, Bolton,
March 9th, 1909.

ELECTRICAL ENGINEER AND CHEMIST (28) with four years shop and test house training; University Education; three years drawing office experience; two years Chemist to large power concern; expert on power plant economy; desires responsible position. Highest references.—Apply Box "A 73," ELECTRICAL ENGINEERING, 203, Temple Chambers, London, E.C.

THE SWANSEA CORPORATION ELECTRICITY WORKS

IT is stated that a syndicate has made an offer to the Swansea Corporation to purchase the municipal electrical undertaking. The local papers state that the proposed purchasers are one of the most powerful syndicates of electrical financiers and engineers in the kingdom, and that the expenditure of about a quarter of a million pounds is contemplated in extending the undertaking generally, not only to private consumers, but also to the numerous works in the neighbourhood, which, it is declared, would welcome a supply of cheap power. The company offers to take over all the present liabilities of the undertaking at the book value, and it is pointed out that the value of the plant to-day is considerably less than the original cost. It is also proposed to make an immediate reduction of 5 per cent. in the charges to consumers, and in three years a reduction of 10 per cent. is guaranteed. The maximum rate for power would be fixed at 1½d. per unit, whereas this is now the minimum offered to consumers by the Corporation. The Tramways Company has indicated its willingness to take power from the proposed company, and it is hoped that the Harbour Trust will do the same. An advantage which is pointed out by this company is that, with a cheap supply of power available, new industries will be directed to the town.

The Utilisation of Peat.—A company has been formed under the name of the German-Hanover Peat Utilisation Co., to work the patents of Messrs. Frank & Caro for the distillation of peat. According to the *Manchester Guardian*, the process has been worked for some time on a fairly large scale at the Mont Cenis Mining Co.'s works at Sodingen. The capital of the new company is about £100,000, and amongst those financially interested are the Deutsche Bank, the Electrical Undertakings Co., and the Mont Cenis Mining Co. The peat is distilled in special retorts, and the gas obtained is said to be particularly pure and regular in quality, and therefore very suitable for gas engines. The fuel cost would be about 0·06d. per electrical horse-power hour, but the value of the ammonia products is stated to cover the whole of the working costs. An important feature of the process is the fact that it is unnecessary to dry the peat before distillation, even if it contain as much as 50 per cent. water.

British Electrical Trade with Spain.—Mr. Victor Wellesley, his Majesty's Commercial Attaché for Spain and Portugal, in the course of some remarks made at a meeting of the Leeds Chamber of Commerce, stated that the British manufacturer appeared to look upon Spain as a market hardly worth having, whereas there was a good outlet for British-made goods, especially heavy electrical machinery, in spite of the heavy tariffs. There was at present a large demand for electrical plant in Spain, but it was mostly being supplied by German firms. Mr. Wellesley urged the British manufacturers to send out capable agents to work on the spot, and to study the requirements and the business methods of the country. A British Chamber of Commerce had already been established at Barcelona, and it was expected that this organisation would prove most useful in promoting trade between Great Britain and Spain.

Power Distribution in Bristol.—At a recent meeting of the Bristol Association of Engineers a Paper was read by Mr. H. H. Couzens, Deputy City Electrical Engineer, on the developments of power distribution in Bristol. After referring to the separate direct-current system adopted in the year 1900, the author described in detail the polyphase system which was substituted for the direct-current system when it was found necessary to extend the supply. With regard to the extensions now being made to the plant at Avonmouth, the author stated that a guaranteed consumption of 14·5 lbs. of steam per kilowatt-hour was given for the new 3,000-kw. sets. About 2¼ to 2½ lbs. of local slack coal was required per kilowatt-hour when working at full load with the new plant. Surface-condensers were used with cooling water from the adjacent canal. In connection with the distributing system, Mr. Couzens described the converting plant in the sub-station for supplying the Docks with direct current for the cranes, &c.

Continuous Testing of Steam Plant.—A Paper on this subject was read by Mr. J. E. Lea before the Manchester Association of Engineers on Saturday. The author emphasised the importance of keeping continuous records of the behaviour of steam plant, as there was admittedly much room for improvement in the efficiency of steam plant, and little progress could be expected until continuous measurements in connection with the coal, water, and steam consumption were made. A technical and commercial log-book should be kept by an expert, whose duties would be to measure and test the coal, take temperatures, test for CO_2, measure the feed-water, and to make many other tests bearing on the efficiency of the plant. This had been done by the author at the works of the East Rand Proprietary Mines of South Africa, the coal bill for which was about £25,000 per annum. Some of the log-sheets made out there were exhibited.

CATALOGUES AND PAMPHLETS RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

DRY BATTERIES.—A new catalogue of dry cells and dry batteries has been issued by Messrs. Siemens Brothers & Co., Ltd., of Caxton House, Westminster. In addition to the well-known and widely-used Siemens-Obach cells, particulars are given of the company's Hellesen form of cell, the "Transport" cell, in which the fluid electrolyte can be emptied out and the cell stored for any length of time, and the more recently introduced "Dura" cell, in which the exciting agent is put in in a dry and inactive condition and plain water added when the cells are required for use. A feature of the catalogue is the information regarding the conditions under which the larger sizes of Obach cells can be successfully used for motor-car ignition purposes.

CABLES AND ACCESSORIES.—A collection of new leaflets is to hand from British Insulated & Helsby Cables, Ltd., one of which gives a good idea of the activity of the company by a list of cable contracts for over 5,000 volts, and another illustrates the laying of H.T. feeders in Moscow. The remaining leaflets deal with a special colliery pattern of the Prescot feeder pillar and the Prescot fault-localising apparatus.

TELEPHONE SWITCHBOARDS.—A leaflet from British Insulated & Helsby Cables. Ltd., illustrates a group of small telephone switchboards in the erecting shop of the Liverpool works.

LAMPS AND FITTINGS.—The latest edition of the lamp catalogue of Messrs. Simplex Conduits, Ltd., contains full particulars of the Simplex metal filament lamp for voltages from 25 to 260 volts, and a considerable selection of glass shades

Simplex Ceiling Fitting for Metal Filament Lamps.

suitable for the elongated bulbs of these lamps. Several fittings specially designed for metal filament lamps are being put on the market, one of which—a handsome ceiling fitting with cut-glass bowl, for four 50-c.p. high-voltage lamps, is illustrated above.

RAILWAY AND TRAMWAY BONDS.—We have received from the Lahmeyer Electrical Co., Ltd., of 109-111 New Oxford Street, a comprehensive catalogue of "Neptune" bonds for electric railway and tramway rails made by the Felten & Guilleaume Lahmeyerwerke Co., at Mulheim-on-Rhine. These bonds are made in a number of varieties of both the solid and flexible forms. The solid bonds are drop forged in one piece from solid-drawn copper, and the flexible bonds, which are also made throughout from drawn copper, have their heads fixed to the connecting wires or strips by drop forging, ensuring perfect connection between the two parts.

SMALL A.-C. AND D.-C. MOTORS.—A leaflet from Messrs. Wright & Wood, Ltd., of Century Works, Halifax, gives full particulars of their standard sizes of two- and three-phase motors of the protected squirrel-cage pattern. These are listed for 50 cycles, 750, 1,000, and 1.500 r.p.m., and for outputs varying from 1/10 h.p. to 5 h.p. Motors for other frequencies and speeds are wound specially. The prices of the starters required for the larger sizes are also given in this list. The D.-C. motors comprise a series of four-pole shunt-wound machines of from ½ h.p. to 6 h.p output. These are also of the protected type, but ventilated or solid end-covers can be had in both cases if required. A special line of polishing and buffing motors for 100 to 250 volts D.-C., and 100 to 200 volts A.-C. (single- and three-phase) is also listed. The smaller sizes of these are totally enclosed, and the starter is contained in the base of the machine. All the above motors can be obtained fitted with ball-bearings at a small extra charge.

TELEPHONES.—The Sterling Telephone & Electric Co., Ltd., of 200 Upper Thames Street, E.C., have sent us a list of reduced prices in the form of a sheet to be inserted in the seventh edition of their telephone catalogue.

Institution of Electrical Engineers.—The following is the result of the ballot for new members on Thursday :—Member.—H. J. S. Heather. Associate Members.—A. H. Atkins, J. R. Bradley, A. Crawford, W. H. Duffett, H. S. Fox, A. L. Hargrave, H. A. Hiorns, C. S. Mallett, W. Middleton, H. J. Mills, W. T. J. Woodcock. Associate.—G. H. Cutbush. Students.—A. Bannister, G. C. A. Chignell, H. R. Constantine.

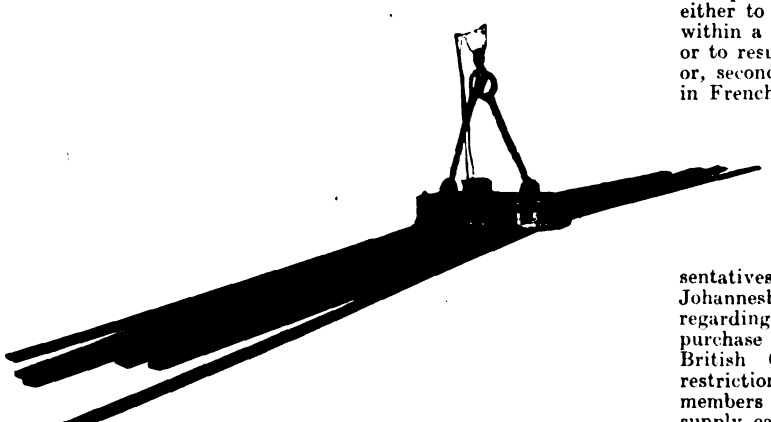
ELECTRO-MAGNETS FOR LIFTING PURPOSES

CONSIDERABLE time can be saved in steel works and the like by the employment of lifting magnets in conjunction with travelling cranes or transporters, for handling pig-iron, rails, girders, steel plates, iron and steel castings, or scrap-iron, also for lifting weights for breaking up the slag from ladles, and similar purposes. The time involved for adjusting slings, chains, &c., is eliminated, and the whole proceeding is under the control of the crane driver, as it is only necessary to lower the magnet on to the material to be raised and operate the switch.



These appliances are constructed in various designs to suit the particular material to be handled. Steel plates, iron or

KRAMOS LIFTING MAGNET HANDLING PIG-IRON.

steel girders, or castings presenting fairly flat surfaces, lend themselves to be handled by electro magnets, which can be constructed with high lifting capacities and made with flat surfaces to suit the material. For handling pig-iron or heaps of small castings, lifting magnets will be found most suitable, as it is impossible to handle such material in bulk economically with ordinary slings or by hand, and for these purposes they are constructed with concave lifting faces, enabling a larger number of separate parts to be drawn to and held by the magnets.

Lifting electro magnets have also a very useful field of action in steel works or foundries where material has to be handled at a high temperature, as castings, &c., too hot to be touched by hand can be handled readily and rapidly.

KRAMOS LIFTING MAGNET HANDLING FLAT STRIPS.

Messrs. Kramos, Ltd., of Bath, have specialised in the construction of this class of apparatus, and some of their magnets are illustrated in the accompanying figures. They are entirely ironclad, and the coil is completely enclosed so that no part is accessible to external injury. To facilitate the radiation of heat, the larger sizes are fitted with corrugated casings and a central ventilating aperture is provided. The coil consists of layers of D.C.C. copper wire, thoroughly insulated from each other from the case. The leads are of steel-armoured cable brought out through a gland in the case and connected to the operating switch in the driver's cage. A cable drum is provided for winding up the slack cable when the crane is lifting. In the largest sizes a discharge resistance is provided, which entirely neutralises the high induction effects in the coil.

The cost of power for working these magnets is very small. An elliptical magnet, 3 ft. 6 in. by 14 in. in size, consumes 440 watts, and will lift 10 cwt. steel plate, 12 cwt. steel strips, or 8 cwt. pig-iron, or 2½ tons of solid steel under favourable conditions. With a 16 in. diameter round magnet a man can handle 275 tons of steel plates per day at an average working cost of one penny per hour. With a 25 in. round magnet, 109,350 lb. of pig-iron can be unloaded from a steel railway wagon in about two hours, the average lift being 785 lb. This necessitated 139 trips of the crane, the current being on for one hour 18 minutes, and off for 50 minutes. The current consumption was 6,600 watts for 1½ hours, or a total of about 8·25 kilowatt hours. At 1½d. per kilowatt hour, the cost of unloading over 50 tons of pig-iron is 1s. for electricity, and all operations are performed by the crane driver without assistance from below. Thus the initial cost of a lifting magnet can be covered by the labour saved in a very short time, and the system compares very favourably with any other for handling materials of this description.

THE TWINOB MOTOR-STARTING SWITCH

A FEW months back (ELECTRICAL ENGINEERING, Vol. IV., p. 455) we described the ingenious double tumbler switch, known as the "Twinob," which Messrs. A. P. Lundberg and Sons had then just introduced. A modification of this switch, specially intended for the starting of small alternating-current motors, is now being put on the market. The construction of the new switch is exactly similar to that of the now well-known ordinary Twinob switch, with its two independent switch movements close together, side by side, and a common terminal between them, with the exception that one switch is provided with a spring so arranged that when released the lever flies back to the off position and cannot be left closed. Thus, to start the motor, both arms are pressed into contact together, but as soon as the motor starts the hand is removed from the switch and one switch flies off, cutting out the starting coil.

Patent Convention between America and Germany.—According to the *Electrical World* (New York), a patent convention between America and Germany, designed to prevent either Government from passing laws requiring that foreign patents must be manufactured in the country in which protection is asked, was signed by the American Secretary of State and the German Ambassador last month. The treaty must be ratified by the Senate in order to become operative.

Proposed Change in French Patent Law.—The principal provision of the Bill introduced by the French Government to amend its patent law provides that patent rights shall be held to lapse in the event of failure on the part of the patentee either to exercise his right in France or in the French colonies within a period of three years after application for the patent, or to resume exercising his rights after this period has elapsed; or, secondly, in the event of only partial exercise of the patent in French territory. In the second event the patent courts will have power to call upon the patentee to show cause why he should not exercise his rights in French territory "in an adequate degree."

Transvaal Government Contracts for Cables.—According to *Commercial Intelligence*, at a recent conference between the Transvaal mercantile representatives and the general manager of the railways, the Johannesburg Chamber of Trade submitted complaints received regarding the restriction by the Administration of its purchase of cable to those firms who are members of the British Cable Makers' Association, and urged that this restriction prevented several firms who were unable to become members of the Association from tendering, though they could supply cables which were equally good and up to specification. The acting general manager stated that there was no wish on the part of the Administration to restrict competition so long as the standards of the various cables were equal. He undertook to make the necessary investigation of the matter. Representations were also made at the conference as to the desirability of publishing a list of all tenders for contracts in the "Government Gazettes," and that when a tender is accepted different from the specification issued, the reasons should be given why it was necessary to depart from the terms of the original specification. The acting general manager undertook to consult the Board as to whether it was prepared to agree to the names and amounts of tenders being published.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 11th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

3,248/08. **Supports for Metal Filaments.** H. Hoge, and The "Z" Electric Lamp Manufacturing Co., Ltd. A circular base of glass or porcelain, with small holes all round its periphery, is fixed in the neck of the lamp, and the resilient supporting wires insulated from each other rise from the centre of this base. A leading-in wire enters the same hole in the base as the beginning of one filament loop, and is welded or cemented to it. The end of the first loop enters the same hole as, and is cemented to, the beginning of the second loop, and so on. Each loop is supported at the top by passing through a ring at the extremity of a supporting wire. Two separate circular bases, one for the supports and the other for the filaments, may be fixed in the neck of the lamp, each being pierced at the periphery as described. Four claims, four figures.

4,113/08. **Speed Variation of Polyphase Motors.** W. Fairweather (*Allmanna Svenska Elektriska Aktiebolaget*). The stator winding can be connected for either two- or three-phase working, and then by changing over from three-phase to two-phase the synchronous speed will be increased by one-third. To supply the two-phase current from the three-phase supply, either a "Scott" arrangement can be used, or, as described in the specification, special auto-transformer windings can be provided on the stator of the motor. By arranging for different numbers of effective poles in the usual way as well, a series of different speeds can be obtained. Two claims, eight figures.

25,557/08. **Manufacture of Tungsten Filaments.** British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*) Powdered tungsten is mixed with cupric oxide and a cadmium-bismuth amalgam, and the resultant mass is squirted into filaments. On baking, the mercury is distilled, and some of the cadmium reacts upon the cupric oxide, producing copper and cadmium oxide. On further heating in a vacuum, the remaining cadmium, the bismuth, and finally the copper and the cadmium oxide are evaporated. This last component soaks up the liquified cadmium and bismuth at the earlier stage, and prevents the formation of globules of molten metal which affect the uniformity of the filament. The remaining tungsten is finally sintered together. Seven claims.

27,152/08. **Driving of Rolling-mills and Hauling Plants.** Akt.-Ges. Brown, Boveri & Cie. This invention relates to the driving of plants with variable loads by direct current from a synchronous motor-generator. To reduce the disturbing effect on the main supply, due to sudden variations in load, the synchronous motor is provided with double excitation; one winding is supplied at constant pressure from an exciter on the same shaft, and the other is supplied from an exciter on the shaft of the main motor. The field winding of the second exciter is in series with the load, and, consequently, the excitation of the synchronous motor will increase with the load. Three claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Baggett, 4,212/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Berry and Harrison [Water-proof wiring fittings] 6,753/08; Egner and Fredriksson [Aerial cables] 26,053/08.

Dynamos, Motors, and Transformers: Allgemeine Elektricitäts Ges. [Crane and lift gear] 17,622/08.

Electrometallurgy and Electrochemistry: Kohler [Cleaning silver plate] 15,962/08; Mennicke [Recovery of tin] 16,428/08; Hughes [Furnace] 16,521/08.

Heating and Cooking Apparatus: Mayor and Main [Heating] 3,931/08; Berry [Cooking] 13,107/08; British Thomson-Houston Co. (*General Electric Co.*) [Heating] 14,537/08; Fuller [Water heater] 14,817/08.

Incandescent Lamps: McKenna (*Glühlampenwerk Anker-Ges.*) [Metal filament lamps] 19,118/08.

Instruments and Meters: Mordey and Fricker [Electrolytic meter] 3,995/08; Horstmann and Horstmann Gear Co. [Meters] 6,008/08; British Thomson-Houston Co., Carter and Martin [Meters] 13,787/08.

Storage Batteries: Schreiber, 105/08; Bristol [Portable accumulators] 5,097/08; Moseley, 6,338/08.

Switchgear, Fuses, and Fittings: Curtis, Mackley and Adams Manufacturing Co. [Push-button switch for lifts] 4,696/08; Pearne [Selective switching system] 15,470/08.

Telephony and Telegraphy: Harrison, and British Insulated & Helsby Cables, Ltd. [Simultaneous telegraphy and telephony] 5,137/08; Hadida [Telephones] 13,982/08; Bradburn [Telephony] 17,206/08.

Traction: Richardson [Signalling apparatus] 4,717/08.

Miscellaneous: Hadey [Targets] 4,002/08; Hughes and Vollhard [Fire-alarms] 4,198/08; Lindemann [Röntgen tubes] 4,479/08; Savart and Graindorge [Sound-producing apparatus] 5,089/08; Buckley [Miners' safety lamps] 10,371/08 and 10,372/08; Dixon and Middleton [Pyrometers] 15,360/08; Berliner [Vulcaniser] 14,610/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Kuzel [Metal filaments] 1,332/09; Allgemeine Elektricitäts-Ges. [Motor controllers] 4,472/09.

Opposition to Grant of Patent

Opposition to grant on the following application has been entered.

28,334/07. **Jointing Wires and Tubes.** British Insulated & Helsby Cables, Ltd., and D. B. Saunderson. An abstract of this specification, which relates to the welding of wires, cables, and tubes by non-electrical means, was given in Electrical Engineering, Jan. 28th, page 94.

Expiring and Expired Patents

The following patents expire during the current week after a life of fourteen years:—

5,798 of March 19th, 1895. **Telegraphic Apparatus.** J. Burry. This is an electromagnetic attachment for automatically winding the main spring of a printing telegraphic receiver or of any other clockwork mechanism. The strain on the escapement is limited by a friction device, and the surplus energy of the winding gear is stored.

5,852 of March 20th, 1895. **Steel Conduit Fittings.** H. Howard and C. G. Harrison. This patent is for a process of manufacturing elbows, tees, or crosses from sheet metal, which consists in stamping out and pressing up the fitting from a blank sheet of metal, and then welding the joint by heating along the edges only.

5,867 of March 20th, 1895. **Railway Signalling Apparatus.** H. J. Pryce and L. G. Ferreira. Apparatus for use on railways worked on the block system, in which an audible signal is given before the visual signal, is described.

6,010 of March 22nd, 1895. **Electromagnetic Clutch.** B. M. Drake, J. M. Gorham, and H. L. Holden. According to this invention, a thin disc of soft iron, either loose on the shaft or attached to one half of the clutch, is placed between the opposing faces to prevent them adhering after the current has been switched off.

6,048 of March 23rd, 1895. (Amended Aug., 1904.) **Flexible Insulating Material.** C. Bollé (*C. W. Jefferson*). This patent is for the manufacture and use of flexible insulating sheets composed of layers of overlapping mica scales cemented together with layers of gutta-percha tissue. Fibrous material, such as asbestos or paper, may be interposed.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. J. Davy [Hot-wire regulating mechanism] 25,577/03.

Distributing Systems, Cables and Wiring, Insulating Materials, &c.: British Thomson-Houston Co., Ltd. (*C. P. Steinmetz*) [Obtaining point of neutral potential with aid of choking coils] 21,294/00; R. W. James (*Mica Insulator Co., U.S.A.*) [Mica insulating sheets] 24,012/01; British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*) [Soapstone-clay-cryolite insulating material] 25,853/03.

Dynamos, Motors, and Transformers: E. A. Carolan (*General Electric Co., U.S.A.*) [Frames for traction motors] 26,042/02; British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*) [Polyphase motor windings for varying number of effective poles] 25,858/03.

Ignition, Electric: F. R. Simms [Sparking plugs] 24,859/98; M. O'Gorman [Cam contact gear] 24,149/01; W. Patterson and H. M. Darrah [Miners' lamps] 25,582/02.

Incandescent Lamps: British Thomson-Houston Co., Ltd. (*J. Howell*) [Producing high vacuum by admitting phosphoretted hydrogen during exhaustion] 23,287/99; J. H. Ladd [Rare earth filaments] 25,698/03.

Switchgear, Fuses, and Fittings: British Thomson-Houston Co., Ltd. (*W. B. Potter*) [Motor controllers] 23,289/99; R. A. Sloan and J. E. L. Barnes [Motor starter] 23,371/99; T. B. Lewis [Resistances] 25,916/02; British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*) [Motor starters] 25,525/03.

Traction: J. F. Bennett and H. S. Morwood [Grinder for tramway rails] 25,908/03.

Miscellaneous: G. Cameron [Electrically-driven portable wood-working machinery] 27,430/97; H. Tindal [Ozone generator] 24,543/98.

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

AN electrostatic voltmeter in which the parts are insulated by compressed air, and which is capable of reading direct-current pressures up to 200,000 volts, is described. (Page 276.)

THE Electrical Trades Benevolent Fund Dinner will be held on Tuesday. (Page 276.)

THE electrical supply of Messrs. Selfridge & Co.'s new building in Oxford Street is taken from the St. Marylebone Borough Council's 2 × 240 volt D.C. mains, from which nine service cables are brought into the building. Thirty-six lighting and twenty power circuits are controlled from a main board in the lowest basement. All the cables are run in solid-drawn screwed conduit embedded in the concrete walls and floors. About 280 arc lamps and some 6,000 incandescent lamps are employed for the lighting, a special feature of which is the concealed window lighting with Osram lamps. The applications of power comprise a group of nine electric lifts and several motors driving fans, pumps, air-compressors, and other machinery. A very complete system of fire-protection, with automatic fire extinguishing apparatus, has been installed. Another interesting novelty is the use of lamp call signals for the heads of different departments. (Page 277.)

AN electric welding plant has been installed in a London wheelwright's shop for welding tyres. The jaws of the welding machine are water-cooled, and about 65 h.p. is taken during the operation of welding. A motor-generator set is also installed, as the supply is direct-current. (Page 279.)

THE two summonses taken out against Mr. W. H. Keys, of West Bromwich, for the sale of bitumen as genuine Trinidad bitumen were dismissed by the Thames Police Court magistrate on Wednesday last week. Mr. Chester Jones held that manjak—a material largely used by Mr. Keys—was as much entitled to be called Trinidad bitumen as was the material taken from the lake or surrounding land. (Page 279.)

WE describe a wind-driven generating plant suitable for supplying current for both lighting and power in isolated districts. A storage battery is, of course, included in the installation, and relay switches for automatically controlling the pressure of the dynamo are

Digitized by Google

provided. The load on the wheel is increased as the speed, and consequently the power, increases. (Page 280.)

THE Finance Committee of the German Reichstag has rejected the proposal of the Government to impose a tax on gas and electricity. (Page 280.)

AN electric locomotive, a design of oil switch and fuse panel, and a new pattern of small regulating transformer, are described in short articles on pages 280 and 281.

A COMMUNICATION has been received relating to Mr. A. M. Taylor's recent Paper on the application of batteries to transmission lines from Mr. R. Orsettich. Mr. Taylor also writes to us on the subject. (Pages 281 and 282.)

THE use of compressed air in the spark transmitters of wireless telegraph installations for the purpose of increasing the range of the apparatus is dealt with in an article by Mr. C. C. Monckton. It permits higher potentials to be used with the same gap; and for a given potential, the smaller gap, and consequent lower resistance when compressed air is used, reduce the damping effect. (Page 283.)

A PAPER read by Mr. Sidney A. Simon before the Glasgow section of the Institution of Electrical Engineers on Friday, dealt with the safeguards that should be adopted to minimise the danger from electrically ignited explosions in coal mines. In gassy situations, where General Rule No. 8 of the Coal Mines Regulation Act, 1887, applies, total enclosure of motors, switches, &c., is laid down by the regulations, and the author discussed what protection is advisable in other parts of the mine, expressing himself generally in favour of "plate protection" instead of complete enclosure. A drawing of a motor with this protection is included in our report. An interesting discussion followed, in which Mr. Sam Mavor and Mr. H. W. Clothier and some other speakers took part. We also comment on the matter in an Editorial Note. (Page 283 and 274.)

PREVIOUS to the inquest in connection with the explosion at the Ackton Hall (Haigh Moor) Colliery, an inspection had been made in the ordinary course by the Home Office, and we are now able to publish the facts that were placed before the coroner as the result of this inspection. There appears to be little doubt that the explosion was caused by a spark on switching off a switch. The joint between the lid of the switch and the case was not a suitable one for use in a mine, not being gas-tight. (Page 287.)

THE report of the general manager of the Liverpool Corporation Tramways for 1908 shows that 121,927,883 passengers were carried, and that the traffic receipts amounted to £563,144. After meeting capital charges, and contributing £24,858 towards the rates, the sum of £49,716 is transferred to reserve, renewal, and depreciation account. (Page 287.)

THE report of the work of the National Physical Laboratory for the year 1908 contains much interesting information relating to the testing and research work which has been carried out. A wave-meter for wireless telegraphy has been calibrated for the Post Office; over 700 incandescent lamps have been tested, and several hundred instruments. Metal-filament lamp standards are being set up, and a large amount of insulation testing at high pressures is being carried on. (Page 287.)

THE Bradford Tramways Committee have decided in future to undertake their own third party risks.—An action is being taken against the Dublin United Tramways Company, in which damages are claimed to the extent of £2,000, for personal injuries.—The proposal of the Dublin Electric Lighting Committee to increase the charges for electric light has been rejected.—The accounts of the Guernsey State Telephone Department for 1908 show a net profit of £380 after meeting capital charges.—A Sub-Committee of the City of London Corporation is now on the Continent inspecting systems of street lighting.—The Marylebone Electricity Committee recommend an appeal to the Local Government Board in connection with the refusal of the London County Council to sanction a loan of £8,000 for street lighting.—The Middlesbrough Corporation Electrical Engineer states that an experimental trackless trolley system is to be installed at Hendon, and that a deputation should visit it.—The Sheerness and District Electric Power & Traction Co. have been fined for erecting overhead wires to plans not approved by the Board of Trade. (Page 288.)

A 2,000-kw. generating set is to be installed by the Bury Corporation; mains, transformers, arc lamps, &c., are required at Fareham; an application to borrow £10,000 for mains, in connection with Blythe's Wharf scheme is to be made by the Stepney Council; a boiler is to be installed at the Bridlington Electricity Works; and new telephone mains are to be laid at Hull. (Page 289.)

AT the meeting of the Hastings and District Electric Tramways Co., it was stated that the cost of maintaining the Dolter surface-contact system had greatly exceeded anticipations, 1,068 studs having had to be removed during the year.—The Chairman of the London United Tramways Co., at the meeting on Monday, complained strongly of motor omnibus competition with tramway companies who had spent large sums of money for their Parliamentary powers. (Page 291.)

A METHOD of compensating for the errors of shunted electrolytic meters due to polarisation, which consists in reducing the current through the cell at heavy loads by means of a series resistance with a high temperature coefficient, has been patented by Messrs. W. M. Mordey and G. C. Fricker. Among the other Patent specifications published by the Patent Office on Thursday was one by the Glühlampenwerk Anker Ges. for a process of coating the supporting hooks of metal-filament lamps with an oxide of tantalum to prevent the filament sticking to the support. A specification by the British Thomson-Houston Co. relates to a stand for heating flat-irons. The heating coil is in the iron, but is only energised when the iron is put on the stand. The grant of a patent to C. H. Stearn and C. F. Topham for a flexible support for metal filaments has been refused. A patent taken out by L. J. le Pontois for a polyphase ignition system, and which had been allowed to lapse, has been restored. (Page 293.)

WHEN it is considered how widespread disaster has so often followed the ignition of gas in a coal mine, probably accentuated and completed by the resulting explosion of coal-dust, any appliance which introduces the remotest chance of producing an explosion must be treated with the greatest caution. The experiments described by Mr. S. A. Simon in his Paper before the Glasgow Section of the Institution of Electrical Engineers, show how readily gas may be exploded in the interior of a motor or switch, and how difficult it is to prevent the ignition of the surrounding gas. It may be taken as an axiom that without efficient inspection and supervision, good plant properly put down in the first place is no guarantee against danger, and this must constantly be borne in mind by those who are in authority. A good motor giving no trouble at the brushes or slip-rings, and fitted with ball-bearings is far more likely to be neglected than a machine which has to be frequently opened out owing to wear and tear of the brushes and other defects. It must, in fact, be generally accepted that if the motor is working in an

Digitized by Google

explosive atmosphere, gas will sooner or later get into the case, and an internal explosion may occur. The motor must therefore be constructed so that an internal explosion will not ignite the surrounding gas. Gauze coverings are mechanically weak, and liable to be punctured or blown out. It is also probable that dry coal-dust would be deposited in the spaces in the "plate" protection described by Mr. Simon, and, being ignited by the explosion, would be blown out in the form of sparks. The design of this motor case is extremely ingenious, and the author's claim that it offers a considerable advantage over gauze protection seems well founded, but the best solution of the problem appears to be to enclose the motor entirely, and build the cases and covers strong enough to stand an internal pressure of at least 200 lbs. per sq. in. This should not be a difficult matter. The present commercial limit of size of an entirely enclosed motor appears to be about 100 b.h.p.; and compared with the total cost of cables and of a haulage plane, the cost of the motor would not be excessive. 100 b.h.p. is sufficient to drive most inbye haulage gears. If more power is required, two motors on one shaft give quite a good arrangement. Although polyphase motors have no commutator, they should also be entirely enclosed, as the small clearance is apt to become choked with coal-dust, and sparks may be generated by the friction between the faces; moreover, there is always the possibility of either the rotor or stator breaking down and causing ignition. The only exception that we would make to the rule that all motors should be totally enclosed would be in favour of those placed in the main airway. Mr. Clothier's remarks on the question of machined faces and strong covers are most valuable. Covers without machined faces and relying on rubber rings are far too common, and are a serious source of danger.

The President of the Institution of Electrical Engineers must have been misinformed when he stated at the annual dinner of the Manchester Local Section that the new arrangements as to the submission and reading of Papers before the local sections were working out very well. Although certainly there have been some excellent Papers submitted before the local sections, and the standard has been considerably improved of late, yet the committees of the local sections would give a very different opinion to the one quoted above. To take one instance only, a meeting of the Glasgow Local Section was fixed for Tuesday, March 9th, but at the last moment it was announced that this meeting had had to be postponed until last Friday, when another Paper was substituted for the one originally selected. After the meeting on Friday, Mr. Lackie, the President of the Local Section, apologised for having had to change the day of the meeting, and explained that the Paper which was to have been presented had actually been sent up to the Institution of Electrical Engineers in London seven weeks ago, but that it had not yet passed the Papers and Editing Committee. On the other hand, we understand that the secretaries of the local sections are informed that Papers can usually be dealt with in about three weeks. The Committees therefore fix the date of their meetings in advance in the usual course, and the resultant postponement and changes of date are of considerable inconvenience to the members of the local sections and of the technical Press. We are aware that the Papers and Editing Committee are doing very good work, as are also the honorary referees to whom the various Papers are submitted, yet we cannot but think that some more satisfactory arrangement could be made.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 25TH.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster, London. Paper to be read:—"The Electrical System of the London County Council Tramways," by J. H. Rider.

FRIDAY, MARCH 26TH.

Physical Society.

5 p.m. Meeting at the Imperial College of Science, Imperial Institute Road, South Kensington. Among the Papers down for reading are the following:—(1) "Note on the Production of Steady Electric Oscillations in Closed Circuits and a Method of Testing Radiotelegraphic Receivers," by Prof. J. A. Fleming, F.R.S., and G. B. Dyke. (2) "The Effect of an Air Blast upon the Spark Discharge of a Condenser charged by an Induction Coil or Transformer," by Prof. J. A. Fleming and H. W. Richardson.

Electro Harmonic Society.

8 p.m. Last Smoking Concert of the season, at the Holborn Restaurant.

SATURDAY, MARCH 27TH.

Institution of Electrical Engineers: Students' Section.

10 a.m. Visit to Woolwich Arsenal, by permission of Col. H. C. L. Holden, F.R.S.

Junior Institution of Engineers.

3 p.m. Visit to the single-phase railway installation of the London, Brighton & South Coast Railway Co.

MONDAY, MARCH 29TH.

Royal Society of Arts.

8 p.m. Cantor Lecture II., on "Steam Turbines," by G. G. Stoney.

TUESDAY, MARCH 30TH.

Electrical Trades' Benevolent Institution.

7 for 7.30 p.m. Dinner at the Hotel Metropole.

Faraday Society.

8 p.m. Meeting at the Institution of Electrical Engineers, 92 Victoria Street, Westminster, S.W. Among the Papers down for reading are the following:—(1) "The Electro-analysis of Mercury Compounds with a Gold Cathode," by Dr. F. M. Perkin. (2) "A New Electrical Hardening Furnace," by E. Sabersky and E. Adler.

WEDNESDAY, MARCH 31ST.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. Meeting at 92 Victoria Street, London, S.W. Paper to be read:—"Electricity Supply," by W. Bernard Thompson.

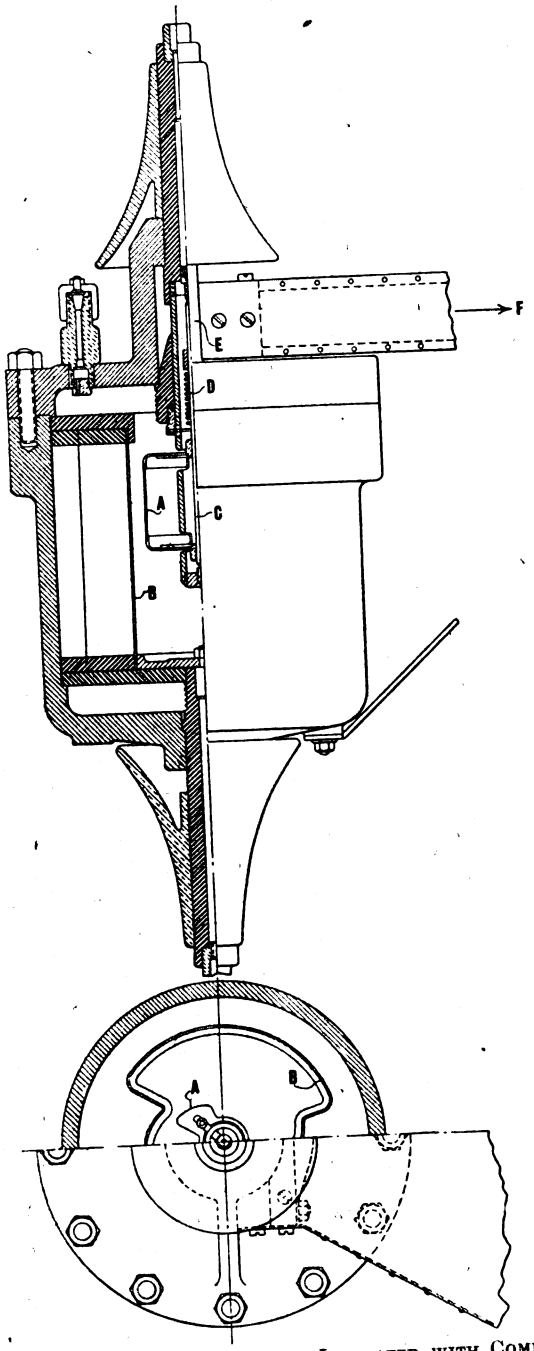
THURSDAY, APRIL 1ST.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster, London. Either the adjourned discussion on Mr. J. H. Rider's Paper to be read this evening will be taken, or, should the discussion be concluded to-night, the following Paper will be read:—"The Theory and Application of Motor Converters," by H. S. Hills.

FRIDAY, APRIL 2ND.

Royal Institution.



9 p.m. Evening discourse by Prof. Sir J. J. Thomson, F.R.S., on "Electrical Striations."

The National Telephone Co.'s Employees.—In reference to the position concerning the construction staff of the National Telephone Co., referred to in our last issue, the Secretary of the National Telephone Co.'s Staff Transfer Association has issued a statement in which he suggests a joint purse arrangement between the company and the Postmaster-General, whereby the constructive work can be maintained. By this means, he says, the cost could be allocated between the parties in proportion as they will respectively benefit from its use. Seeing, the statement continues, that the question of the dismissal of the construction staff arises from a state of affairs which has been created artificially, the staff feel sure they have general support in calling upon the parties to come to some arrangement.

Digitized by Google

A NEW VOLTMETER FOR 200,000 VOLTS

IT will be remembered that Mr. E. A. Watson, who read a Paper on the dielectric strength of compressed air before the Institution of Electrical Engineers on Thursday, March 11th, exhibited that evening an electrostatic voltmeter for measuring directly pressures up to 75,000 volts. The working parts of this voltmeter were insulated by being enclosed in an iron case containing CO_2 at a pressure of 150 lb. per sq. in. Mr. Watson mentioned that he had under construction an instrument for measuring pressures up to 200,000 volts, and he has sent us a

Voltmeter for 200,000 Volts Insulated with Compressed Air.

drawing and some particulars relating to this voltmeter, which is insulated with compressed air.

A direct-current voltage of this magnitude is by no means easy to measure by any of the ordinary methods, transformers being, of course, quite out of the question. Any voltage dividing arrangement employing large and small condensers placed in series, as sometimes used for alterating-current work, is also inapplicable owing to the leakage current of the condensers (which is generally negligible with alternating currents of ordinary frequency). An arrangement of resistances with a current-measuring instrument, as employed at the National Physical Laboratory (see page 287), would have been possible, but was rejected by Mr. Watson on account of the large amount of power which even a small current means at such a voltage as 200,000, and on account of the small amount of power (about one watt) which was available in his particular case.

It was decided, therefore, to construct a series of electrostatic voltmeters which should be capable of taking the full "line" potential on the working parts. The choice lay between instruments insulated with oil and those insulated with compressed air, and it was finally decided to adopt the latter type, the chief reason for this being the somewhat unsatisfactory behaviour of oil under high D.C. pressures.

In the instrument illustrated, which is intended to read up to 200,000 volts, an air pressure of 200 lbs. per sq. in. is employed; joints are made with rings of composition sheeting placed in grooves in such a manner that they cannot squeeze out. All joints at terminals, &c., are made self-sealing, and the air pressure can be maintained for long periods without any appreciable drop. In order to avoid brush discharges the moving member *A* is built of copper sheet beaten on a former of such shape that no sharp edges are presented, the construction being evident from the figure. By appropriate shaping of this and the fixed member *B*, the deflection is caused to be nearly proportional to the pressure, and a fairly uniform scale is obtained. The clearance between fixed and moving members *increases* with the pressure, and for the maximum deflection is about 2 cm. The dielectric strength of the compressed air employed (at 200 lbs. per sq. in.), is about 400,000 volts per cm. As can be seen from the figure, a mirror, *E*, is attached to a steel spindle, *C*, on which is fixed the moving part. A lamp throws a beam of light through the glass window in the case on to the mirror, which reflects it on to a scale, *F*, not shown in the drawing. The torque on the moving part is considerable, and acts against a coiled spring, *D*, of heavy piano wire.

ELECTRICAL TRADES BENEVOLENT FUND DINNER

SIR WILLIAM H. PREECE, F.R.S., will preside at the festival dinner of the Electrical Trades Benevolent Institution at the Hotel Metropole on Tuesday next at 7 for 7.30 p.m., and will be supported by Mr. W. M. Mordey, Mr. R. K. Gray, and Professor J. Perry as Vice-Presidents. Mr. T. E. Gatehouse has undertaken to be responsible for the musical programme. Applications for tickets should be sent in as soon as possible to Mr. W. Davenport, 2 Queen Anne's Gate, Westminster, London, S.W. The price of the tickets is 21s., including wine. We understand that very good results are anticipated from the subscription forms, which have been in circulation for some time; whilst the contribution to the fund coming from the Manchester Exhibition is likely to be very substantial. In addition, a further substantial balance from the Olympia Exhibition becomes available next year.

Shock on Electric Tramcar.—Whilst alighting from one of the cars of the Lanarkshire Tramways Co. in October, 1907, a Mrs. Struthers received an electric shock from the canopy rod, and subsequently fell into the roadway, sustaining injuries from which she died. Her husband had entered an action against the company for £500 damages, but when the trial came on last week, it was stated that the company had paid a sum in settlement.

Electrical Dispersal of Fog.—An action was heard last week at the Birmingham County Court, in which Messrs. Hoyer, Wideman & Co. claimed the sum of £67 5s. 4d. from J. R. Kessler for expenditure incurred in promoting a company to acquire and work an invention for dispersing fog by electricity. Mr. Kessler, who had been in the employ of the company, had persuaded his employers to interest themselves in this invention, and various agreements had been entered into between Messrs. Hoyer, Wideman & Co., Mr. Kessler, the inventor Mr. Micheluzzi, and a fourth party, Mr. Nobile. These related to the sharing of the expenses of promoting the company, and also to the sharing of the profits. A trial of the apparatus, which took place before representatives of the Admiralty on a gunboat, was a failure, and after other trials and experiments, which were also failures, the plaintiffs decided to stop supplying funds, and called upon Mr. Kessler for his share in the expenses. Payment was refused on the ground that the expenses were incurred in conducting experiments, and not in promoting the company, and the agreement related only to the latter expenses. The judge held that the wording of the agreement was quite plain on this point, and gave judgment for the defendant.

THE ELECTRICAL EQUIPMENT OF SELFRIDGE'S STORES

THE large steel-frame building which has been erected by Messrs. Selfridge & Co., Ltd., in Oxford Street covers a ground space of about an acre, and comprises five floors above ground and three basements, the lowest of which is 50 ft. below the street level. All the floors and most of the partition walls are of reinforced concrete, and the latter divide the interior of the building into a number of rectangular compartments, each about 24 ft. square. The consulting engineers for the electrical installation were Messrs. Wallis-Jones & Dent, of 50 Queen Anne's Gate, S.W., and the contractors were Messrs. Malcolm & Allan, of Glasgow.

The whole of the supply for both lighting and power is obtained from the St. Marylebone Borough Council's mains, and there is no private generating plant or battery reserve. Three trunk feeders direct from the central station, and interconnected with a battery sub-station, terminate at pillars in the neighbourhood of the building, and from these nine services enter the building at one point. These comprise four triple concentric and five concentric lead-covered cables, of which one is a spare cable in each case. There are thus seven active services. The cables are carried along from the incoming-point to the main switchboard in the lowest basement in sheet iron troughing filled with sand and suspended from the ceiling. The board is divided into three parts. The first is the lighting board, and consists of two panels, one for either side of the 2×240 volt three-wire system. An illuminated voltmeter and ammeter, and an automatic circuit-breaker, are fixed on each panel. There are thirty-six lighting circuits, each fitted with double-pole switches and tubular fuses of from 150 to 200 ampere capacity, for the ground and upper floors of the building, and the current for these circuits is measured by electrolytic meters and demand indicators connected across heavy shunts. Besides the above there are twelve lighting circuits for the basements, current for which is obtained on a flat rate. The middle board contains the Council's switch-fuses and meters and the bus-bars to which the service cables are connected. All the power circuits are controlled from the third board; these are twenty in number, eight at 480 volts. The fuses and switches for the power circuits are in cast-iron boxes, one for each pole, the handles being linked together. These boxes are fixed on the front of the board, and the lids are easily removed for replacing fuses. Both the boxes and the whole framework of the board are earthed, and earth wires for this purpose and for the earthing of the other boxes, &c., are run all over the building. Two large triple-pole hand-operated switches which, according to the specification, are capable of breaking the circuit at 1,000 amperes, are provided, one for lighting and one for power.

From the switchboard, the sub-mains rise up to the various distribution boards, of which there are thirty-four for the general lighting and many smaller ones. The cables, which vary in size from 37/12 to 19/16 S.W.G., were supplied by the Anchor Cable Co., and are of two qualities, 600 megohm C.M.A. grade for the lighting circuits, and 2,500 megohm grade for the power circuits. In all cases the cable is enclosed in heavy-gauge solid-drawn screwed steel conduit, supplied by the Credenda Conduits Co., Ltd., which was coated with a preservative enamel after erection. Except in the basements, these conduit tubes are embedded in the concrete walls, and the cables were drawn through after the whole of the conduit was laid. Sharp elbow joints have been avoided, and a large number of wrought-iron assembly and inspection boxes have been provided. The tubes, where they enter and leave these boxes and those containing the distribution boards, are bushed with ebonite.

The distribution boards, which were supplied by Messrs. J. H. Tucker & Co., Ltd., consist of slate panels mounted on waxed battens, these latter being fixed to the bottom of the wrought-iron enclosing boxes. Linked double-pole knife-switches are provided for the larger, and tumbler switches for the smaller circuits. The usual pattern of clip replacement fuses have been employed throughout. All the conduits are earthed by a special earth wire at each board. The boards are recessed into the wall, and are covered with handsome mahogany doors.

For the general lighting of the interior, Westinghouse enclosed arc lamps have been employed; there are in all 286 of these lamps. On the ground floor there are 60 ornamental $7\frac{1}{2}$ ampere lamps with 65 burning hours, and fitted with large opalescent diffusing globes. The remaining 226 lamps are 6 ampere lamps with 65 burning hours, and are scattered all over the building. To ensure safety, the lamps are hung, wherever possible, from the girders, and an interesting feature is that the conductors have been enclosed in the hollow links of the chains supporting them. All these lamps are wired two in series across the 240 volt circuit. Besides these arc lamps, there are nearly 6,000 incandescent lamps installed, most of which are metal filament lamps. In the basements, pendants of four Tantalum lamps, two groups of two in series, are used, and in some places the two lamps run in series are hung from separate ceiling-roses on the looping-in system. In the latter cases, the ceiling-roses are provided with three terminals, and in the event of high-voltage lamps running in parallel being substituted for the present series lamps, it will necessitate only a simple reconnection at the ceiling-roses. On the staircases and in other similar positions alternate lamps are wired on separate circuits. To provide for external decorative lighting, 36 special six-way terminal boxes, fitted with switch-fuses, have been erected at different points on the four upper floors. Conduit tubes run from these boxes to points between the piers on the exterior walls, and so illuminated devices hung outside can be readily supplied without any unsightly temporary wiring.

One of the most important features of the installation is the method of window lighting which has been adopted; a wide wrought-iron trough fitted with silvered glass reflectors is run along the whole length of each window at the top, but concealed from view. In each trough is fitted a number of pairs of 120 volt, 55 watt Osram lamps, burning in series. Although all the lamps are burning in a horizontal position, and a very large number were supplied, the contractors informed us three days after the opening of the building that only one lamp had failed, which speaks well both for the lamps themselves and for the careful handling. The effect of the above method of window lighting is excellent, as the usual glare on the eyes is entirely absent.

A large number of portable show-cases are in use on the various floors, and these are illuminated by interior trough fittings provided with opalescent glass linings. Tubular carbon-filament lamps are employed in these fittings; all the connections are made with asbestos-covered wire. A switch is fitted on each showcase, and current is taken by means of cable enclosed in flexible metallic tubing, from the nearest floor or wall plug of which there are a very large number. These latter are of Messrs. Lundberg & Co.'s pattern. The plugs are wired in special circuits controlled from the distribution boards.

The building is equipped with nine Otis electric

Digitized by Google

passenger lifts, designed to travel at a speed of 300 ft. per minute, and capable of each carrying 15 persons. In addition, there are two goods lifts of 5,500 lb. capacity each, and running at 150 ft. per minute. Each lift is operated by a special automatic controller, and provision is made to enable the lift to be run at the maximum or at a slower speed. Signals are fitted on each landing to indicate the approach of any lift in either direction. Among the other power applications which should be mentioned are the pumping plant in connection with the artesian well which is sunk 400 ft. below the level of the lowest basement. This plant is belt-driven by a 20-h.p. interpole motor, and is capable of delivering 5,000 gallons of water per hour into the storage tanks at the top of the building. A 5-h.p. motor drives an air compressor for the tube delivery system, and there are other motors used in connection with the ventilating system. A large number of smaller motors are also used all over the building.

This description of the electrical equipment of Messrs. Selfridge's premises would hardly be complete without some reference to the most complete and efficient system of temporary wiring which was put down by Messrs. Malcolm & Allan for providing light and power during the period of construction, which for a large part of the time was carried on day and night. A temporary main switchboard was erected in the basement, and several portable distributing boards on light wooden supports were in use. A mortar mill, and a sack hoist were electrically driven, and some portable electric tools were also used.

The whole building has been protected from fire by the Aero fire alarm system. In this system a small copper tube containing air at normal pressure is run through the various rooms and fastened up at the ceilings so as to be practically invisible. There are 45 lengths of this tube, the ends of which go down to a central switchboard on the ground floor, where they are coupled to registering devices called detectors. The detectors signal any pressure generated in the tubes which rises at a more rapid rate than the heating arrangements will account for. By the simple and ingenious method of having a controlled leak in the tubing, any rise in pressure due to the ordinary heating changes are allowed to pass unnoticed; but any abnormal heat expands the air in the tubes so fast that the leak cannot prevent the pressure rising, with the result that a detector is operated. This drops an indicator showing where the fire is situated, and simultaneously rings the fire gong and sends a message to the Aero Co.'s own call station at 92 Queen Victoria Street, London, E.C., which turns out the fire brigade. In order to test the system, a small quantity of air is injected into each tube, slightly increasing the pressure in it and dropping the indicator. The pressure produced by this means is very much less than any fire would create; therefore, if the apparatus responds to this test, it is an absolute certainty that a fire will be caught in its incipient stages. Within the building there are over seven miles of tubing installed, and the switchboard gives 45 distinct indications of the location of a fire, thus enabling the firemen on the premises, or the fire brigade, to go straight to the seat of the fire.

While the function of the Aero installation is to locate the fire, and to call the fire brigade, there is another protective installation, the Grinnell sprinkler system, which deals with the fire automatically before the arrival of the brigade. Water sprinklers or nozzles are arranged in the ceilings at short intervals, and each nozzle is provided with a valve which is kept in the closed position by two small levers soldered together. If the temperature in the neighbourhood of any nozzle rises above 150°F., the solder melts, and water is sprayed out over an area of about 100 sq. ft. Water is supplied from three separate sources: from a main in Somerset Street, from the special air-pressure tanks provided in the basement, and from an automatic injector connected to the hydraulic power mains in Oxford Street. Directly any valve in any part of the building is opened, the flow of water which takes place is caused to ring a fire gong. Besides these automatic devices, there are hydrants on each landing of the staircase in connection with the hydraulic mains. This latter and the Grinnell installation were supplied and erected by Messrs. Mather & Platt, of Salford.

In an establishment of this size, it is of great importance to be able readily to ascertain the whereabouts of the principal members of the staff. This is accomplished by an ingenious system of signalling by four electric lamps of different colours, fixed in various parts of the building, each combination of lamps corresponding to a different person. In the telephone exchange four switches are fixed, by means of which the lamps can be lit simultaneously at every signalling point, in any desired combination. The person required, on seeing the lamps alight in his particular combination, then rings up the telephone exchange from the nearest point, and is at once placed in direct communication with the inquirer.

The private telephone exchange is at present equipped for 20 public service lines and 160 local stations, but provision is made for 60 public lines and 400 stations. Portable telephone instruments are provided in the restaurant, which may be connected to the telephone wires at 54 different points, and used at any table. There are also portable sets on the counters for the use of customers. An installation of 60 electric tell-tales, worked at night from the telephone circuits by a change-over switch, to record the patrols of the night watchmen, is also provided, with portable telephones at two points for communication between an inside and outside watchman.

Electric clocks worked on the Synchronome system are used throughout the building, the equipment consisting of one master clock operating 19 dials, by means of half-minute impulses. The master clock is synchronised electrically with Greenwich mean time every hour. In conjunction with the clock system a special signalling apparatus is used for ringing bells at fixed hours each day to indicate to the staff the times of beginning and leaving off work.

Among the contractors who have supplied materials for the electrical installation and whom we have not already mentioned, are the following:—Fittings, Veritys, Ltd., Spital & Clark, General Electric Co., Ltd.; telephone installation, National Telephone Co., Ltd.; main switchboard, Johnson & Phillips, Ltd.; ventilation work, Ashwell & Nesbit.

In conclusion, we should like to acknowledge our indebtedness to Mr. W. G. Malcolm, of Messrs. Malcolm & Allan, for showing our representative over the installation.

Standardisation of Engineering Publications.—We have received a prospectus of an association which has been formed under the name of the Engineers Standardised Publications Association, with the object of effecting reform in regard to the standardisation and classification of manufacturers' price-lists, &c. The association is approaching engineering firms with a view to arranging for the issue of their lists, &c. in the standard size and form recommended, so that they can be collected together, filed, or bound in standard cases. A card index forms a part of the scheme. The association proposes to supply the files and index case to its subscribers, and also undertakes the issuing of manufacturers' lists to them. The advisory committee consists of Mr. A. H. Dykes, Mr. T. W. How, Mr. H. M. Sayers, and Mr. W. H. Booth. The secretary is Mr. J. D. Barton Innes, and Mr. John I. Hall is technical manager. The offices are at Craven House, Kingsway.

ELECTRIC WELDING AT A LONDON WHEELWRIGHT'S SHOP

A WELDING installation of considerable interest, and important because of its thoroughly practical nature, has recently been put down in the smiths' shop of Messrs. Kerswill Bros., wheelwrights and tyresmiths, of Crosskeys Mews, Marylebone Lane, W.

The welding machine is of the well-known Prescot type, and was supplied by British Insulated & Helsby Cables, Ltd. It has been especially designed for welding tyres and hoops of flat or channel section up to 4 sq. in. A general view of the machine is given in Fig. 1. On the heavy cast-iron base, within

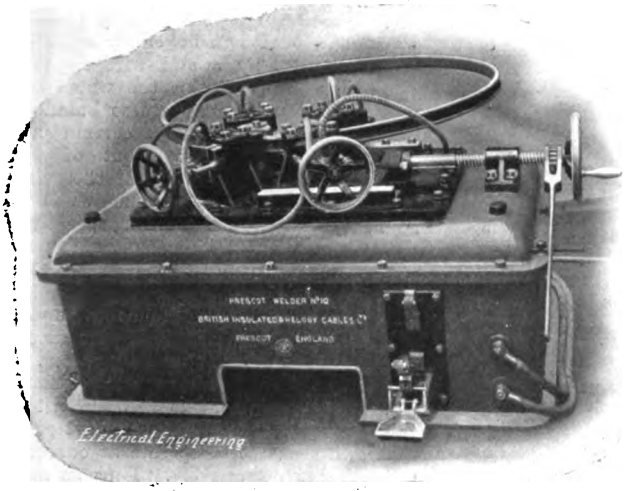

FIG. 1.—TYRE-WELDING MACHINE WITH WELDED TYRE IN POSITION.

which is the transformer, are fixed two copper plates, insulated from each other and from the base by fibre sheet. The bolts are also insulated from the plates by fibre washers and tubes. On the left-hand plate are two fixed clamping pieces, and on the right-hand plate two movable ones. Each clamping piece consists of a copper block provided with an internal channel for water-cooling, as shown in the sketch of Fig. 2. This block slides in a copper frame, and has a contact piece which can be changed to suit the section of tyre which it is required to weld. The two clamping pieces on the right are mounted on a sliding plate which can be moved towards or away from the fixed pieces by means of the handwheel shown on the right. For the "upsetting" movement, the lever and ratchet is employed. For

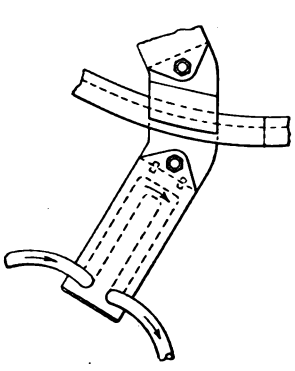

FIG. 2.—SKETCH OF JAWS, SHOWING DETACHABLE SHOES AND WATER COOLING.

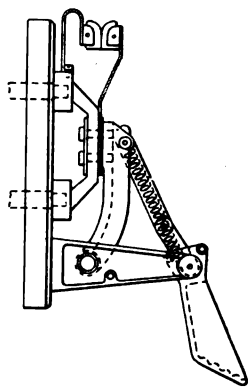

FIG. 3.—PEDAL SWITCH IN PRIMARY CIRCUIT OF TRANSFORMER.

adjusting and tightening the clamps, the two handwheels in the foreground are used.

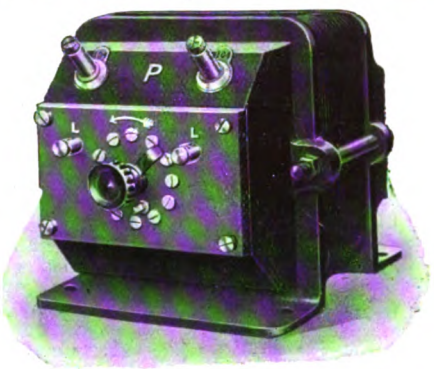
The two copper plates are connected to the secondary winding of the transformer, which has a ratio of approximately 80 to 1. The primary is supplied with current at from 100 to 200 volts, 50 cycles, and when welding, a current of approximately 17,000 amperes flows across the joint at a pressure of from ¾ to 1½ volts. The secondary of the transformer consists of a copper casting (a single turn), and is placed between sections of the primary winding to reduce leakage. When the ends of the tyre have been adjusted, the current is switched on by depressing the pedal of the main switch in the primary circuit. A sketch of this switch, shown open in the photograph, is given in Fig. 3, where it is shown closed. The voltage is regulated by means of a variable resistance in the field circuit of the alternator supplying the transformer, or, in the case of an alternating supply, by tappings on the primary of the transformer. The upsetting of the weld raises a burr at the joint, and if this is to be swaged on an anvil three men are necessary, two to do the swaging and handling, while one operates the machine. The capacity of the machine is about 35 tyres per hour. About eight gallons of water per hour are needed for cooling the jaws.

As the installation in question is supplied with current from the St. Marylebone 480-volt direct-current mains, a motor-generator is provided. This has a capacity of 35 kw., and is also used as a motor for driving a high-speed cold saw for cutting through tyres. The motor-generator is of the Lancashire Dynamo & Motor Co.'s make. The power required during welding depends largely on the shape of the tyre, but averages 65 h.p. for 2½ minutes.

WHAT IS BITUMEN?

ON Wednesday last week Mr. Chester Jones, Thames Police Court magistrate, gave his decision with regard to the summonses against Mr. W. H. Keys, of West Bromwich, who was alleged to have sold Trinidad bitumen under a false trade description. In all there have been ten sittings of the Court to hear the summons, and a general *résumé* of the case was given in our issues for February 11th and March 11th.

Mr. CHESTER JONES said that there were two summonses, one for selling goods under a false trade description, and another for falsely describing the country of origin of the goods, in respect of ten barrels of Keys' Standard No. 1 bitumen and ten barrels of Keys' Standard No. 3 bitumen, supplied to Messrs. George Wills & Co., Chapel Street, Whitecross Street, E.C. The real prosecutors were Messrs. Previté, who were the sole consignees of Trinidad Lake asphalte, which contained 60 per cent. of bitumen, 35 per cent. of mineral matter, and the balance organic matter. Until a few years ago this was the only bituminous product brought from the island of Trinidad, but later on manjak, which contained 90 per cent. of pure bitumen, was discovered. The whole case turned upon whether Trinidad manjak could be called Trinidad bitumen. He found it very difficult to say that it could not. The term bitumen was used in a very ambiguous way by both parties in this case, it having been held to apply to manjak by some witnesses, and by others only to the product of the lake or surrounding land with all its impurities. The latter had also been called asphalte, and he preferred this description of it, although one witness had stated that the proper term for it should be pitch. In his opinion that manjak might be called Trinidad bitumen, he was fortified by the evidence of Mr. Blount, who was called by the prosecution, although this fact was hard on Messrs. Previté. It was common ground that neither the lake asphalte nor manjak could be sold as a commercial article without treatment, and such was the change in its character when a flux was added that Mr. Callender himself could not recognise Trinidad Lake asphalte when mixed with shale oil instead of petroleum. Thus it appeared to be a very important matter as to the flux which was added. Keys' Standard No. 1 had a larger proportion of flux than was used with Trinidad Lake asphalte, and although manjak was used by Mr. Keys, Mr. Callender could not suggest any other name for it than Trinidad bitumen. If it were permissible for Messrs. Previté to add a flux, as they were bound to do, and still call it Trinidad bitumen, then Keys' Standard No. 1, even though it had a slightly greater percentage of flux, could also be called Trinidad bitumen, and the same applied to Keys' Standard No. 3. It was the active part of the material that mattered, and as this admittedly came from Trinidad, he had come to the conclusion that there was no false description so far as the country and origin were concerned.



The next point to be considered was whether to call the material supplied Trinidad bitumen was a false trade description having in mind its constituents. In this connection he could not help recalling the specification put in by a witness from the Admiralty, which stipulated that the material should not contain more than 30 per cent. of mineral matter, at the same time calling for Trinidad bitumen. Obviously the Admiralty could not expect the material from the lake, because it contained more than 30 per cent. of mineral matter. Strictly speaking, the moment the material was dealt with, Trinidad Lake bitumen was ruled out of the matter altogether, and he was faced with the position of two sets of people giving different meanings to the term "Trinidad bitumen." It was therefore useless to ask him to convict, for he did not think that "Trinidad bitumen" had such a general meaning in the trade that everyone buying it would imagine he was getting the material from the lake. There was another aspect of the case, viz., that on the quotation for the twenty barrels which were the subject

Digitized by Google

of these summonses the words "Keys' Standard No. 1" and "Keys' Standard No. 3" were underlined in red, and Messrs. Wills, who alleged that they knew of only one grade of Trinidad Lake bitumen, must have known that they were not getting it. On these grounds, therefore, he dismissed both summonses, and allowed £150 costs to the defendants.

SMALL REGULATING TRANSFORMERS

THE accompanying illustration represents a type of variable-voltage or regulating transformer suitable for incandescent lamp testing, medico-cautery work, and for purposes wherever a wide range of voltage is required, which has been brought out by the Foster Arc Lamp & Engineering Co. In actual practice transformers of this description have been supplied having a range of voltage from 400 to 5 in steps of 20, 10, and 5 volts, and capable of delivering 20 amperes at any pressure. The illustration is taken from a photograph of a cautery transformer having

Foster Regulating Transformer.

a range of 0–10 volts on the secondary side, and designed for 104 volts primary at 50 frequency. The switch being directly attached to the transformer, which is of fireproof construction similar to that of the firm's well-known metallic filament lamp transformers, gives a neat and compact appearance to the apparatus. The transformers are manufactured complete by the company at their Wimbledon works. The firm also supplies the coils to switch manufacturers and the trade generally for auto-starters.

Institution of Electrical Engineers.—In addition to the list given on p. 269 of our last issue, the following should have been mentioned as having been elected to the class of students: H. V. C. Cotton, G. A. Houghton, F. Jackson, E. Jones, E. L. S. Minors, F. L. Pedley, H. M. Schofield, O. Thornycroft, F. Tyrrell, and A. Welch.

Large High-voltage Single-phase Motor.—A description of a 150-h.p. single-phase motor supplied direct from the 3,900-volt mains at Elberfeld, Germany, is given in the *Elektrotechnischer Anzeiger*. The motor drives a large fan in a foundry, and has some interesting features. The main stator winding is divided into two halves, these being put in series at starting. An auxiliary winding, which is connected to the mains during starting only, is put in series with a choking coil to produce the necessary phase displacement. When full speed has been attained the two halves of the main winding are connected to the main supply in parallel. The auxiliary winding is switched off automatically directly the resistance in the rotor, which is wound three phase, has been short circuited, but to indicate if it is left in circuit accidentally, a red lamp is put in series with the relay which keeps the switch of the auxiliary-winding circuit closed.

Effect of Radiations on the Brush Discharge.—A Paper by Mr. A. E. Garrett on this subject was read at a recent meeting of the Physical Society by the author. Willows and Peck, in 1905, found that radium radiations have the power to extinguish a brush discharge produced by a Wimshurst machine when the gap is greater than 3–4 cms. The present experiments show that the same phenomena can be produced by means of an induction-coil capable of giving a 6-in. spark. The observation of Willows and Peck that the β-rays are responsible for the effects produced is confirmed. Experiments are described which illustrate the effect of the nature of the anode on the sensitivity of the positive brush. The appearance of the brush is viewed in a rotating mirror, and also by means of a microscope fitted with a 3-in. objective, and a marked difference is noted between the appearance of a sensitive brush and that of the brush from a pointed anode on which radium has practically no effect. By this means, and also by altering the capacity, it is found that the sensitive nature of the brush depends upon the oscillatory nature of the discharge, and it is thought probable that a side discharge takes place when the brush is extinguished by the radium.

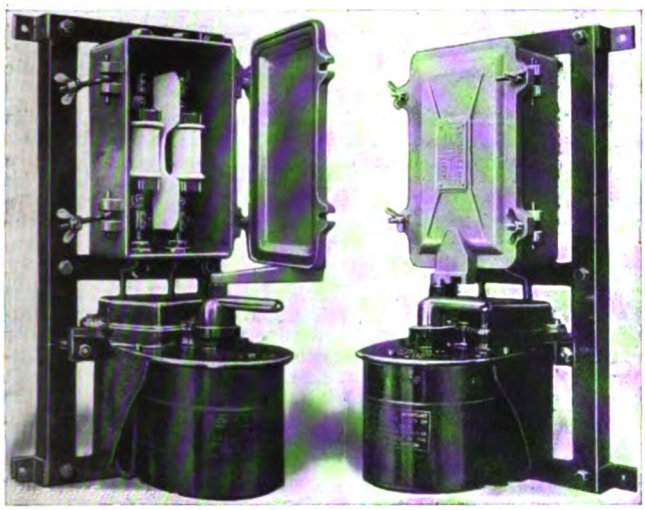
WIND-DRIVEN ELECTRIC GENERATING PLANT

A DEMONSTRATION of the working of a wind-driven generating plant was given on Monday at the works of Messrs. J. G. Childs & Co., Ltd., of Hawthorn Road, Willesden Green. The plant consists of a 16 ft. diam. wind turbine on a steel tower 50 ft. high, governing and switching gear, generator and battery. The main frame of the machine swings round a vertical pivot, and is held in the correct position by three tails. The small tail on the one side is fixed, but the two larger tails are free to rotate about a horizontal spindle from the vertical plane into a horizontal plane. When these tails are in the vertical plane, the machine is in the running position with its wheel at right angles to the wind; but when the two tails are turned into the horizontal position, the force of the wind slews the wheel round until the wind is blowing approximately parallel with the plane of the wheel and thus has no effect upon it. The two movable tails are connected by a steel-wire rope to the bottom of the tower, and by means of this the wheel can be thrown out of the wind. The movable tails are so balanced on their pivots that when the wind rises beyond a certain predetermined limit, the tails automatically move out of the vertical position, and in proportion to the velocity of the wind tend to take a horizontal position, thus allowing the wheel to turn more and more away from its normal working position. The effect of this is that, in heavy winds, the amount of power exerted by the wind on the turbine can be kept within the measure of that required for the generator.

The generator is of 2-kw. capacity, and has a speed variation from 800 to 1,600 revolutions per minute. Its armature shaft is placed vertically, and is driven direct by means of a belt from a pulley placed at the bottom of the vertical shaft of the wind-turbine tower. The control of the field circuit is effected by relay switches in the main circuit. In this particular plant there are six of these switches, set to operate at currents of 5, 8, 11, 14, 17, and 20 amperes respectively. Thus as soon as the speed of the machine, and consequently the pressure of the dynamo, rises to such an amount that the current delivered is about 5 amperes, the first relay switch operates and inserts a resistance in the field circuit. The speed of the turbine is thus allowed to increase as the velocity of the wind increases. As this corresponds to greater power, the next switch does not operate until the current exceeds 8 amperes, and so on. Thus the governing is done on the output instead of the speed of the wheel, the object being, of course, to allow the wheel to run at its most economical speed. Besides the relay switches there are the usual automatic switching arrangements for cutting the battery in and out in accordance with the voltage of the generator. Charging can go on day and night and through the week ends without any attention whatever.

The plant running at the works is capable of producing about 1,500 units per year with the conditions of the winds such as obtain in London at the height of 50 ft., but, by running the tower higher, better results would be obtained. On some parts of the coast the wind power available is from three to four times greater than it is in London. The turbine, tower, generator, and switchboard could be supplied for about £150; but the cost of the battery, which should be of sufficient capacity to deal with the normal load for at least three days, must be added to this. We are informed that the cost per unit available from the battery for a plant of the above size amounts to about 2·5d., including capital charges. The plant at the works supplies current for lighting, cooking, heating, and power for the purpose of demonstrating the use of such an installation.

Proposed Tax on Electricity in Germany.—A Reuter telegram states that the Finance Committee of the German Reichstag on Saturday rejected, without debate, the new gas and electricity taxes proposed in the Government's Taxation Bill.



Arc Lanterns for Cinematograph Theatres.—The new cinematograph shows which are now being run all over London and in the suburbs are proving good customers of the supply stations. For example, the lantern room of the Marble Arch "Palace" contains two large Pathé Fréres cinematograph outfits, each provided with an arc lamp taking from 40 to 50 amperes. The voltage across the arc is about 50 volts, and, as current is taken direct from the 240-volt supply of the St. Marylebone Borough Council, the remaining 190 volts is taken up by resistances, only one lamp being used at a time. There is a third but smaller lantern taking about 20 amperes for throwing ordinary slides on the screen. A small 220-volt motor drives the film mechanism of each apparatus. The film rollers are enclosed in sheet-iron cases, which are automatically closed if the film is burnt through, and there are many other ingenious devices for obviating all fire risks. The lantern-room itself is entirely fireproof.

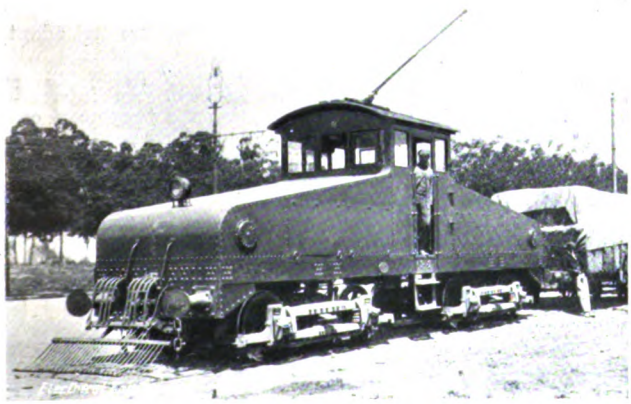
OIL-SWITCH AND FUSE-PANELS

THE accompanying illustration is reproduced from photographs of one of a group of oil-switch and fuse-panels of a special design which Messrs. Reyrolle & Co., Ltd., of Hebburn-on-Tyne, have just completed in considerable quantities for a large order.

Each panel is fitted with one of the firm's standard 50-ampere oil-switches and a standard 50-ampere watertight distribution box, and an interesting point is the way in which the lid of the distribution box is interlocked with the handle of the oil-switch



Special Pattern of Reyrolle Oil Switch and Fuse Panels.

so that the switch cannot be put on unless the lid of the distribution box is closed; and, conversely, the lid of the distribution box cannot be opened while the switch is in the "on" position. The quadrant attachment to the distribution-box lid has a slot running its whole length, and forming part of a circle, of which the hinge of the box is the centre. The pin on the oil-switch handle has a certain amount of circular movement, and it is only in the "off" position of the handle in which the position of the pin coincides with the radius of the slot in the quadrant.

ELECTRICAL LOCOMOTIVES FOR SOUTH AMERICA

THE photograph below shows one of six electric locomotives recently supplied to the Rural Tramways, La Croze, South America. These locomotives, which were built by Messrs. Dick, Kerr & Co., are of the ordinary central cab type, and are mounted upon Brill 27 E.1. type bogie trucks. Each locomotive is equipped with four of Messrs. Dick, Kerr & Co.'s 7.B. traction motors, which motors are capable of an output of

Electric Locomotive for La Croze Tramways.

50 h.p. on the one-hour rating basis when operating on a 500-volt D.C. circuit. The total tractive effort of the locomotive at full load is 5,720 lbs. at the car wheels at a speed of 13·2 M.P.H., the current taken being 90 amperes per motor, or a total of 360 amperes. The diameter of the truck wheels is 34 in., and the gear ratio of the motors is 71/15. The gauge of the track is 4 ft. 8½ in. The motors are operated through the agency of a type Q.2. Form A. controller. This controller has five series notches and three parallel notches. There is no electrical brake, but each locomotive is fitted with a Christensen straight air-brake equipment, type C.3. The current is collected from the overhead trolley wire by means of a single trolley of the straight under-running single-deck type. The maximum speed is a little over 20 miles per hour. The locomotive measures 30 ft. long over the head stocks and 7 ft. wide over the side sills. The bodies were built at Messrs. Dick, Kerr & Co.'s general engineering works, at Kilmarnock, the equipments being made at the firm's electrical works at Preston. The principal contractors for the Rural Tramways were Messrs. J. G. White & Co., to whom Messrs. Dick, Kerr & Co. were sub-contractors for the locomotives described above.

BATTERIES AND TRANSMISSION LINES

A WRITTEN communication to the discussion on Mr. A. M. Taylor's Paper entitled "Extending the Limits of Power Transmission," read recently before the Birmingham Section of the Institution of Electrical Engineers, has been received from Mr. R. Orsettich (General Electric Co., Witton, Birmingham).

Dealing first with the question of voltage, the writer thinks that the figure of 270 initial volts per mile is taken too low. The well-known American rule of thumb is 1,000 volts per mile for the first three miles, and 400 volts per mile for each subsequent mile. In this way a transmission of 15 miles would require 7,800 volts, whereas only 4,000 volts would be considered suitable by the author. On a 100-mile line instead of the 27,000 volts proposed, one would have to take 42,000 volts. If one considers that the cost of the copper is in inverse ratio to the square of the voltage, it will be easily seen what would be the effect of the alteration.

The necessity of using high voltage in order to increase the range of operation is also borne out by the fact that several companies, who, in the beginning, had put down a plant working at what was estimated at the time to be sufficiently high voltage, found out later that, in order to obtain economical conditions of working, they had to raise their voltage as soon as the experience gained in the working of the line enabled them to do so with safety. Other parts affected by an alteration of the initial voltage would be the supports, the transformers, and the switchgear.

As, however, the increase of all these items taken together will represent only an increase of about 28 per cent. of the cost for doubling the voltage to 40,000, it will be seen that this is entirely cancelled by the saving in copper, which will now be reduced to one-quarter of the original amount.

Mr. Orsettich considers Mr. Taylor's estimates of cost of support of the line higher than necessary, and also the amount taken for depreciation. The communication concludes as follows:—

"To the proposed adoption of storage batteries in connection with long-distance transmission, I am afraid most engineers will have some grave objections. The principal one would be the necessity of converting the alternating current to continuous, with its well-known handicap of rotating machinery and expensive switchgear. Further, the range of distribution from each battery would be very limited on account of the low voltage, this in its turn requiring very expensive feeders and heavy drop, which will come in addition to the losses of transformation in the machines and in the battery. The limited range of each battery would have, as a consequence, the necessity of using a very large number of batteries. It is well known that the area of distribution is a very large one in most of the existing transmissions, as is shown by the fact that many times the distribution itself is done at 2,000 or 3,000 volts. The argument of the author that the use of batteries will not necessitate a second line of transmission because of the increased safety does not appear to me to hold good, as the battery would be only designed to supply the peak load, and, therefore, in the best cases to keep up the supply for half a day in case of breakdown. The peak itself is not of real importance as far as the line is concerned in an installation of this kind, because there is always a large amount of reserve in a generating station which can be used to overcome the drop of the line at the moment of maximum demand. The real difficulty with hydraulic plants lies in the fact that the supply can be kept up only for 9 or 10 months at the most, and that a reserve in steam plant is necessary for the other two months. This steam reserve is always placed in the centre of the area of distribution, and the cost of the line, therefore, affects the current produced under these circumstances in an entirely different way. Whether, under these circumstances, it is advisable to use one or more storage batteries seems to me a very difficult question to answer, and most probably can only be decided in each individual case.

CORRESPONDENCE

BATTERIES AND TRANSMISSION LINES.

To the Editor of Electrical Engineering.

Sir,—I cannot allow Mr. Addenbrooke's statement that "the relative position between batteries and generating plant has altered but little during thirteen years" to go unchallenged. He says that batteries and accessories then cost £19 per kw., but omits the all-important question as to the rating of the accumulators. Now, Mr. Highfield, in 1901, gave £20 for a one-hour rating (probably too high), and Mr. Snell, in 1904, gave £8 for a one-hour, and £15 10s. for a three-hour rating (ex-buildings), whereas I now give £5 10s. and £9 10s. respectively. Consequently, if Mr. Addenbrooke's 1896 figure is on a one-hour rating, the cells have come down from, say, £18 (ex. buildings), to £5 10s., while the steam plant has only come down from £19 to £13 (Mr. Addenbrooke's figures), in the same period. Even if Mr. Addenbrooke's 1896 figure was for a three-hour rating (which, I think most unlikely), the battery costs have come down from £18 to £9 10s. per kw.

I therefore cannot agree that the relative position is unaltered, even on capital costs. But I have shown elsewhere that the saving in *fixed charges alone* will suffice to pay twice over for the perpetual maintenance of the cells—the question of the saving on these fixed charges being never realised till lately—and this, again, alters the complexion of the problem.

Lastly, our notions of the cost of the energy entering the battery have, during these thirteen years, come down from about 0·7 penny per unit to 0·1 penny, and this, again, totally alters the aspect of the seriousness of the waste in the battery, and enables us to consider the taking up of proportions of the peak load that nobody would have thought of doing thirteen years ago.

As regards the employment of 50,000 volts, I quite realise its practicability in many instances, and of course I was aware of its advantages; but the argument of my Paper remains unchanged if Mr. Addenbrooke will double the abscissæ, representing distances, on my Fig. 1, and read 54,000 volts instead of 27,000 volts.

In conclusion, I would say that I am only too pleased to give Mr. Addenbrooke all credit for the good work he has done in his early Papers, and his pioneer work in the Midlands district, which we all admire.

Yours faithfully,

A. M. Taylor.

King's Heath, Birmingham.

CATALOGUES AND PAMPHLETS RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

ELECTRIC BUILDERS' HOIST.—A pamphlet from Mr. G. Wüthrich, of the British department of the Oerlikon Co., describes a self-contained motor-driven drum on a wheeled truck, which should prove very useful as a hoist-gear for building operations and similar purposes where electric current is available, and in warehouses alongside wharves, &c. The motor drives the drum through a worm-gear, and the starter and brake are interlocked. The apparatus, complete with a 6-b.h.p. motor, weighs a little over a ton, and is suitable for raising loads up to half a ton at a speed of approximately 1′ 8″ per second up to a height of 82 ft. Continuous-current, single-phase, or three-phase motors can be used.

TRANSFORMERS FOR METAL FILAMENT LAMPS.—The Sun Electrical Co., Ltd., of 113 Charing Cross Road, have issued a new list of auto-transformers and balancing transformers for metal filament lamps. These are standardised in various sizes up to 1,800 watts for frequencies from 40 to 100 cycles. They are designed for high efficiency at all loads rather than exceedingly high efficiency at full load only, and have very small voltage drop from no load to full load.

WOOD CASING, &c.—A leaflet is to hand from Messrs. C. G. Bates, timber merchants, 80 Fenchurch Street, giving prices of electric light casing and capping made from American Tupelo whitewood.

A.E.G. ELECTRICAL PLANT, APPARATUS, &c.—Amongst a group of pamphlets, &c., being issued by the A.E.G. Electrical Co. of South Africa, Ltd., Caxton House, Westminster (agents for the A.E.G. Foreign Department of Berlin), is one devoted to the A.E.G. Curtis steam turbine, of which a number of patterns are illustrated for both electrical generating plant and marine work. Another pamphlet gives particulars of continuous and alternating-current brake magnets for cranes, &c., and a leaflet calls attention to the advantages of the combination of A.E.G. metal filament lamps with holophane globes. One of the most attractive of the series, however, is a booklet containing some very effective illustrations showing examples of the use of a system of decorative illumination by means of flexible strips, fitted with large quantities of small incandescent lamps, together with a variety of forms of advertising signs.

HORSE-POWER METERS.—A list just issued by Messrs. Crompton & Co., Ltd., of London and Chelmsford, deals with wattmeters calibrated to read direct in horse-power, assuming an average efficiency for the motor with which they are to be used. These should be very convenient for ascertaining the approximate power taken by various classes of machinery, and determining the most economical size of motor to use.

ELECTRICITY SUPPLY.—The Electricity Supply Department of the Borough of Harrogate are issuing a handsome pamphlet giving a quantity of information relating to the supply of electricity and the capabilities of modern metal filament and arc lamps, cooking apparatus, and other domestic appliances.

ADVERTISING SIGNS.—A list from Credenda Conduits Co., of Scholefield Street, Birmingham, illustrates and describes an attractive illuminated device known as the Venner sign. In these signs the letters are formed by means of glass balls let half-way into a piece of sheet metal, which forms the front of a box. The back of the box is a reflector, and each ball has the benefit of direct or reflected rays from every lamp in the box.

SIGNALLING GEAR FOR MINES.—A comprehensive catalogue from Messrs. Siemens Brothers & Co., Ltd, of Caxton House, Westminster, gives particulars of the Siemens mine-signalling system, which is in extensive use abroad. Electrically actuated step-by-step dial instruments of the nature of engine-room telegraphs are employed, and these are made in a great variety of forms. Mining telephones, water-tight bells, &c., are also included, and a special illuminated signal apparatus, adapted for use as level indicators and as safety devices for cages with several decks. Particulars are also given of a depth indicator and speed regulator, which can be used for both steam and electric winding plants.

Tramway Rail Renewals.—A cyclist who was thrown, at the junction of Brighton Road and the Portsmouth Road, near Surbiton, on account of his wheel having caught in the rails of the London United Tramways Co., has been awarded £175 damages. The resident engineer for the company stated that the rail in question would not require renewing for over a year. A stay of execution was granted with a view to appeal.

New Hungarian Single-phase Railway.—A new railway is to be constructed this year between Budapest and Waitzen, with a total length of about 30 miles, including a branch line to Gödöllö. According to *Elektrische Kraftbetriebe und Bahnen*, the line will be equipped for single-phase working at 10,000 volts 15 cycles. The 70 sq. mm. contact wire will be hung on the double catenary suspension system, with automatic adjustment of the tension on the wires. The rolling-stock will consist of eleven motor-coaches each with two 120 h.p. motors, a number of trailing coaches, and four locomotives for the goods traffic. Each locomotive will contain two 250 h.p. motors, and will weigh about 40 tons. Power for the line will be obtained from a steam-power station; the machines, of which there will be three 1,000-kw. sets, will generate direct at 10,000 volts 15 cycles. Three 700-kw. three-phase sets generating at 5,500 volts 42 cycles will also be installed for supplying energy for light and power purposes to the various railway stations and depôts in Budapest. The work will be carried out by the Hungarian Siemens-Schuckertwerke-Ges.

Electric Cooking in Marylebone.—The convenience and adaptability of electricity for temporary lighting and heating when a supply is available and also for temporary power purposes under the same conditions is unquestioned. An interesting and suggestive example of its application for temporary cooking purposes is afforded by an installation which has been fitted up every Thursday for the last three weeks in connection with some practical lectures on cooking given in the Cavendish Rooms, Mortimer Street, W. These lectures have been organised by Miss Hope, of the Gordon League for the benefit of women of the working classes. On account of the rooms being required for other functions on the other days of the week, it was necessary that the whole apparatus should be removed after each lecture, and the expense and trouble of laying and connecting gas piping would have been considerable. A couple of leads are brought up from the main switch in the basement, and the cooking apparatus and a couple of radiators to warm the room are supplied through these. The apparatus used comprises a "Phœnix" range, and a number of auxiliary fittings, including a grill, hot-plates, electric saucepans, and kettles, and a flat-iron. All the apparatus, with the exception of the large range, has been loaned by the St. Marylebone Electricity Department, from whose mains the current is taken. There would seem to be a good opening for such electrical cooking installations in training colleges and other similar institutions where lectures and demonstrations on cooking are given. We are indebted to Mr. F. H. Davies, Commercial Engineer to the St. Marylebone Electricity Department for the above information.

THE DIELECTRIC PROPERTIES OF AIR CONSIDERED FROM A RADIOTELEGRAPHIC STANDPOINT

By C. C. F. Monckton

THE Paper read by Mr. E. A. Watson before the Institution of Electrical Engineers recently should be of considerable practical importance to the manufacturer of radiotelegraphic apparatus. As was pointed out by Dr. Russell, in the discussion that followed the Paper, the formulæ and experimental data of the Paper are not applicable for an oscillatory discharge. On the other hand, in the case of a transmitter, it is only during a very small interval of time that an oscillatory discharge is taking place, and during the rest of the time charges are accumulating on the spark-knobs much in the same manner as would be occurring in the experiments described.

When using secondary sending circuits of large capacity, as employed, for instance, by Marconi, a considerable amount of energy can be easily stored at a comparatively low potential, so that the spark-gap is short, and, in general, the distance between the spark-knobs would be less than the diameter of the knobs, so that a disruptive discharge would take place without the formation of a corona. On the other hand, with smaller capacities as used, say, in the single sending system of Lodge, this sparking distance sometimes becomes much greater than the spark-knob diameter. Several years ago the writer was using a spark-gap of $2\frac{1}{4}$ inches, and knobs only about $\frac{3}{8}$ in. diameter. Probably this was a cause of great loss due to the formation of a corona; and this would not have occurred if the knobs had been made several inches in diameter. It was realised in the very earliest experiments that something was wrong in the first practice of small knobs and long spark-gaps. Several inventors, including Lodge, Righi, and Marconi, found a remedy in using multiple spark-gaps. This device has long been discarded by Marconi with his large capacities, but it has been retained by Lodge. It is evident that an insulated conductor between the knobs would get oppositely charged by induction from the two main knobs, so that the multiple knobs enable the total spark-gap to be increased without the formation of a corona.

Compressed air was used for radiotelegraphy by the Rev. Jervis Smith as early as in 1902, and it has also been largely used by Fessenden. The writer has thought that the use of compressed air round a spark-gap might be of great use for isolated land systems up to 300 or 400 miles, when a single sending circuit is used. For the same energy stored, the shorter oscillatory spark in compressed air would have considerably less resistance, and consequently the damping effect would be greatly reduced; or, on the other hand, using the original spark-gap and aerial system, a much larger store of energy could be efficiently accumulated. When, two years ago, the question of using the existing radiotelegraph station at Tobago for signalling to Demerara was under consideration, the writer made a number of preliminary inquiries with regard to the possibility of obtaining a satisfactory spark-gap designed to work in compressed air, as he thought that by this means the increased distance would have been efficiently worked with the existing aerial.

NOTES ON SAFETY OF WORKING ELECTRICAL PLANTS IN COAL MINES

AT the Glasgow Section of the Institution of Electrical Engineers, on Friday, a Paper was read by Mr. Sidney A. Simon, of the Electrical Co., dealing with the risks of explosions being caused by electrical plant in coal mines, and the safeguards that should be adopted to minimise these. In the first place, however, he pointed out that there has been a remarkably small number of serious accidents involving loss of life or injury to persons or property, and that particularly no accidents have occurred which have occasioned explosion of firedamp or coal dust.* But although this would tend to show that engineers and colliery owners are working along the right lines, and that with good work carried out by reliable people with a reputation at stake these dangers become fairly insignificant, this should not, however, be taken as a reason for relaxation of precautions; although the danger of an accident may not be imminent, yet the effect of one occurring might—and probably would—be very disastrous. Further, owing to the past immunity from accidents there is no indication by actual experience as to which of the variety of protective designs may be less safe.

The special rules distinguish between two distinct classes of location of electrical apparatus, viz.: (1) Places or parts of mine where General Rule No. 8 of the Coal Mines Regulation Act, 1887, applies; (2) all other places. This rule is quoted verbatim below.†

Rule 4 of Section V. (Motors) only provides for the enclosure of all current-carrying parts of motors, switches, starters, and accessories in flame-tight uninflammable enclosures of sufficient strength to resist the effects of an explosion in the interior in all locations under Class 1, unless the place in question is a room separately ventilated with intake air.

The author then proceeded to consider the precautions that should be taken in ordinary use in mines where total enclosure under the above rule is unnecessary. In underground working, the author continued, the atmosphere is usually warm and very often damp, whilst in many cases, such as in the neighbourhood of pumps, it may be charged with moisture, or there may even be water actually dripping from the roof or leaking pipes, splashed from projecting rocks, or sprayed from the pumps. Due precautions should therefore be taken that the insulation of the winding and current-carrying parts is of a character to resist the continued action of moist atmosphere. The insulating material used for high-tension work is generally better suited to stand this action than that commonly used on low or medium pressures, and it is therefore specially important in cases where medium pressure is employed to pay particular attention to the class and method of insulation, and to avoid the use in it of any material of a hygroscopic nature. The accumulation of coal dust on the windings should be avoided as much as possible, as it might form a conducting film or layer over the insulation to the frames. Periodical inspection and cleaning should be enforced as a preventative.

From the above considerations it will be clear that the motors should be placed in well-built chambers, properly lighted and ventilated with intake air, and to which, by being as far as possible shut off from the main roadways, there is less liability for the penetration of coal dust. Such chambers can easily be kept clean, and the writer has seen many of them in Continental mines, which, with their arched roofs and spotless tiled pavements, it was difficult to conceive were 600 or 700 yards below the surface of the ground. The engine-man having care of

* In the discussion (see our Report on a later page) it was mentioned that one such accident had recently been recorded. A note with regard to this also appeared in Electrical Engineering at the time.

† Extract from the Coal Mines Regulation Act, 1887:—

"Rule VIII.

"*Use of Safety Lamps in Certain Places.*

"No lamp or light other than locked safety lamp shall be allowed or used.

"(*a*) In any place in a mine in which there is likely to be any such quantity of inflammable gas as to render the use of naked lights dangerous, or

"(*b*) In any working approaching near the place in which there is likely to be an accumulation of inflammable gas.

"And when it is necessary to work the coal in any part of a ventilating district with safety lamps, it shall not be allowable to work coal with naked lights in another part of the same ventilating district situated between the place where such lamps are being used and the return air way."

Digitized by Google

machinery in such a chamber has every inducement to take a pride in the condition of his charge.

If it is impossible to avoid dripping or spraying water by building the chamber with waterproof arches and walls, or by arranging a suitable roof over the motor to lead off the water and prevent it dropping on to the motor, it is necessary to have recourse to enclosing covers which should be of the weather-proof ventilating pattern, and easily opened for examination of the windings. Totally enclosing covers, admitting of no ventilation, do to a great extent prevent the accumulation of dust, but interfere very considerably with the cooling, and necessitate the use of large types of machines in which the material is insufficiently utilised, with a consequent lower efficiency and higher price. Even the choice of larger types with reduced output, said the author, is not always sufficient to keep totally enclosed motors within the limit of permissible temperature rise, and artificial means of cooling, such as water-jacketing of the motor cases and bearings, has to be resorted to, which still further increases the price of the motor, the complexity of working, and the running cost. There is, moreover, a practical difficulty in regular inspection, examination, and cleaning of a motor with enclosing covers, and it is less difficult to get the average attendant to clean up and blow out an open-type motor regularly, firstly, because there is less troubled involved, and secondly, because the inspecting official is more likely to notice any default on his daily rounds.

The probability is that the majority of the motors in a mine would be of the induction type; those working on continuous service for driving endless haulages, pumps, creepers, or fans would, if of the slip-ring type, in all probability be provided with devices for short-circuiting the rotating windings and lifting the brushes, so that the moving contacts would only be in use for a short period of time when starting up. Such motors undoubtedly do not require enclosures of any sort, as an attendant could always ascertain and avoid starting the motor if fire-damp were present. Motors which require frequent stopping, starting, or speed regulation, however—*e.g.*, for main and tail haulages, staple winders, hoists, &c.—would not be provided with short-circuiting and brush-raising devices, and there would be a likelihood of sparking occurring the whole time they were in service. Even for such cases, however, no hard-and-fast rule for enclosing can obtain. The advisability of enclosing such slip-rings would depend on local conditions, which determine the degree or probability of the unexpected presence of fire-damp in the chambers.

For all motors with their apparatus and accessories located in positions where General Rule 8 applies, and which are not in chambers separately ventilated with intake air, the rules call for total enclosure, and it therefore only remains to investigate from experience gained how far such means afford protection, and to what extent this protection should be applied to cases above discussed where the total enclosure is not actually required by law.

Experiments were carried out for the purpose of determining the value of totally enclosing as a protection against explosion at the time of the special committee on the use of electricity in mines, and details of these experiments are contained in the minutes of evidence published in 1904, upon which the report and recommendation were based. Exhaustive experiments with the same object were also commenced on the Continent about the same time, and extended into 1905. The author gave a short account of the results of these tests in his Paper, as he believed that no account of them had been published in this country in a readily accessible form.

The trials in question were carried out conjointly by six of the leading electrical engineering firms in Germany, and the committee of the Westphalian Mining Fund, who kindly placed special experimental galleries at their disposal, and bore a share of the expenses. In these galleries the apparatus to be tested was operated in explosive atmospheres, both of air and actual fire-damp, and of air and fine coal dust. The fire-damp was drawn from a disused working of the mine on which the galleries were built. A first series of tests of special apparatus and machines submitted by various firms was made in 1903, and showed that practically all the protective devices proposed were either insecure and a positive danger in an explosive atmosphere, or ineffectual for mechanical or electrical reasons. Such, for example, were enclosing of complete motor with wire gauze or solid covers, enclosing of overhung slip-rings in solid so-called gas-tight covers, or immersion of slip-rings in oil. So far as the totally enclosing of the complete motor or of the slip-rings was concerned, it was found practically impossible to prevent the entrance of explosive mixture into the interior, especially if the motor were frequently started and stopped with consequent alternate heating and cooling of the enclosed gases.

If sparking occurred in the service of these motors, an internal explosion resulted, which generally either blew the enclosing covers off, otherwise damaged the motor casing, or expelled flames and ignited gases through the bearings and oil wells, thus in most cases communicating the explosion to the surrounding atmosphere. It was found, however, that if gaps were provided of a certain size, *i.e.*, not too small to prevent the egress of the heated gases and cause a dangerous rise of pressure, and not so large as to allow free passage of the burning gases, the communication of the explosion was avoided.

The covering of the openings with wire gauze (even with two layers) was not found altogether satisfactory. In many cases this may have been due to the too coarse mesh which had been provided, but generally it was found that the gauze did not offer sufficient cooling surface relatively to the large volume of gas enclosed to prevent its being raised to a dangerous temperature, and finally allowing the explosion to be communicated to the external atmosphere. A curious phenomenon was observed with this method of enclosure which also tended to render the protection ineffective: the continued combustion inside the motor of fire-damp after the first explosion had ignited it. As combustion proceeded, the hot products were carried off through the gauze at the top of the motor, and fresh fire-damp was introduced below to take its place and thus feed the flame. The consequence was that the gauze was soon raised to a very high temperature and destroyed, and an explosion took place in the gallery. A further disadvantage of this class of motor is an electrical one, due to the very small amount of ventilation which the fine-meshed gauze required permits, in deference to which it is necessary to design the motor practically on the same lines as a totally enclosed one, so that the electrical characteristics are not of the best, and the motor is large, heavy, and high in price.

In the case of slip-ring motors the immersion of the slip-rings in oil was found to cause difficulties of an electro-mechanical nature, which entirely precluded their employment.

In consequence of the negative results of these trials, a second series of experiments was undertaken in 1904. In the first place, the nature of the explosion was studied, and how this depends on the volume of gas, quality of the mixture, configuration of the enclosing casing, and position of the origin or point of ignition. In particular, observations were made on the extent to which the nature of the explosion was modified by introducing partitions with orifices and other obstacles.

When a mixture of fire-damp and air is exploded in a closed vessel free of internal obstacles, the author explained, the maximum pressure of the explosion is about $6\frac{1}{2}$ to 7 atmospheres when the volumetric percentage of methane is about 7 to 8 per cent., the pressure being attained about one-fifth of a second after ignition. With a smaller or larger percentage, not only is the maximum pressure less, but the explosion takes place at a slower rate, *e.g.*, with about $5\frac{1}{2}$ per cent. methane, the pressure rises to about $3\frac{1}{2}$ atmospheres, the maximum being reached in about half a second, while with about $13\frac{1}{2}$ per cent. methane the maximum pressure is only about 4 atmospheres, this being reached about one second after ignition.

Experiments with various sizes of containing vessels showed that the actual rate of explosion depended to some extent on the shape and volume, but the maximum pressure was practically independent of these variants. This, however, does not apply if obstacles are introduced which materially alter the configuration, nor to two vessels communicating with one another through a small aperture. If ignition takes place in one of the two vessels, the pressure in the second may rise to much more than 7 or 8 atmospheres. In some cases it was found to rise to as much as 12 atmospheres. This is of the greatest importance in designing enclosed apparatus for mining purposes, and shows that the designer must under all circumstances avoid apparatus enclosed in several separate compartments communicating with one another through small apertures, *e.g.*, a case containing a switch and fuse in separate compartments, with small holes between the two through which the electrical connections pass.

At first sight the statement might seem paradoxical that the more gas-tight the lid of such a case fits, the greater is the danger if an explosion does occur inside. A test on such a switch and fuse-box, however, proved this conclusively. Each compartment *A* and *B* was closed with a separate lid held in place with four screws. When tested by exploding an explosive mixture in each compartment separately, the apertures being closed with tight-fitting plugs, no adverse results were observed; when both compartments were filled with an explosive mixture, however, and the plug in one of the apertures in the dividing partition was removed on igniting the mixture in compartment *A*, a violent explosion occurred which completely wrecked compartment *B*, and that notwithstanding that the lid of *A* was not a tight fit, but allowed some of the gas to escape round its edges.

A similar result was observed in an enclosed three-phase motor with slip-rings enclosed in a separate casing outside the bearing. The motor casing was provided with several small openings

Digitized by Google

covered with fine gauze, while the slip-ring casing was provided with a so-called labyrinth seal, the function of which was to prevent a serious rise of pressure in case of an explosion—in fact, to act as a sort of safety-valve. The motor was run in an explosive atmosphere (in the trial gallery), and, after running some time, the gas in the motor casing was artificially exploded to simulate the effect of an earth or short circuit. A violent explosion occurred in the gallery, and it was found that the casing of the slip-rings had been blown off, the 47 rivets, 3 mm. diameter, being torn asunder. The explosion in the motor casing had been communicated to the gas in the slip-ring casing through the oil well of the bearing, the high pressure generated in the motor casing, notwithstanding the gauze-covered openings, being sufficient to force the oil out of the oil well and drive the ignited gas into the slip-ring casing, igniting the mixture there with the above described results. Owing to the explosion taking place there under pressure, it was much more severe than it would have been under ordinary circumstances, so that the safety-valve arrangement above described was no protection.

Owing to the difficulties of building motors and other electrical apparatus actually gas-tight, *i.e.*, in which there is no communication between the inside and the surrounding atmosphere, and the observed fact that an explosion can take place in a box with a badly-fitting lid without communicating itself to the surrounding atmosphere, a series of experiments was undertaken with a view of studying this phenomenon. Without giving the details of these experiments, the Author gave the result, viz., that with a very explosive mixture of about 9 per cent. methane an explosion can take place within a vessel with a comparatively large aperture, without the surrounding gas being ignited by the flame issuing from the aperture; with a greater or lesser proportion of methane the danger of igniting the surrounding gas increases, and the limiting size of aperture for safety decreases. The immunity from external explosion also depends on the distance of the point of ignition from the aperture, the nearer the point of ignition to the aperture the greater the danger of external explosion. This immunity from external explosion depends on two factors—the so-called "expansion action" and the time element. Experiments have shown that an explosive mixture of fire-damp ignites at a minimum temperature of about 650° C. It must be exposed to this temperature for about 10 seconds, however, before ignition takes place. The hot gases issuing from the casing at a high pressure expand, and in so doing cool themselves below the temperature of ignition of the surrounding gas. If the pressure of explosion in the casing is high enough, the hot gases issue at such a velocity that the duration of exposure to the surrounding mixture through which they are ejected is not sufficient to cause ignition before they are cool. The results of these experiments may be summarised as follows:

1. The maximum pressure developed in a vessel of moderate capacity by an explosion of accumulated fire-damp is about 6·5 atmospheres. If in the inside of the vessel small portions are divided off by internal objects, and the compartments thus formed communicate with one another through comparatively long and tortuous passages, some portion of the enclosure may be exposed to a pressure of 8 atmospheres. Moreover, if the interior is partitioned off into large spaces communicating with one another through small apertures, according to the size and number of these compartments, internal pressure may be developed which no practicable method of enclosure can be made to resist. In mines of very great depth the internal pressure is proportionally higher.

2. Small openings, such as narrow gaps or fine slits in the enclosure, are not dangerous. The larger the area of opening, the less effective is the enclosure, and especially so if the aperture does not expose cooling surfaces to the gas in its passage through it. Moreover, it is less effective the nearer the point of ignition is to the aperture, and the danger increases inversely with explosiveness of the gas. An enclosure which is not gas-tight, or one with openings, is generally safe if the pressure of the ignited gas rises to 1·1 atmosphere or more before flames are expelled.

It was further found on extending these experiments to motors that the rotation of the rotors modified considerably the effects produced. Thus an enclosing cover of the slip-rings of an induction motor was found to be perfectly safe with an opening of 60 sq. mm. in all kinds of gas when the motor was at rest. When the motor was running, however, with a hole of 100 sq. mm., the internal pressure of explosion rose so high as to burst the cover off and cause an external explosion, while in subsequent trials with a still larger opening, although the internal pressure remained within safe limits, yet the flames issuing through the opening caused an external explosion. The rotation, therefore, appeared to increase the pressure and rapidity of the explosion. In another case a totally enclosed continuous-current motor had holes of 8 mm. diameter drilled through the covers. When stationary, 16 holes with an area of about 800 sq. mm. together were found safe; while with 20 holes, with an area of 1,000 sq. mm., an external explosion occurred. When running 32 holes (1,600 sq. mm.) were still safe; but with 34 holes (1,700 sq. mm.) an external explosion took place. Although then an enclosing cover with apertures in it may, under certain circumstances, be an effective protection, it cannot be relied on in every case, as its efficacy depends on the composition of the gas, the position of the point of ignition relatively to the aperture, and to the state of motion of the rotating parts—all of which, and particularly the last factor, may influence the effect of an explosion in a manner which cannot be determined *a priori*. Under the most favourable circumstances, moreover, the maximum safe area of the openings is small, so that a motor would have to be designed practically with the characteristics of a totally enclosed motor.

In order to increase the effectiveness of this method of protection, the labyrinth enclosure was proposed. This consisted of two or more perforated covers placed one in front of another and arranged with the apertures in adjacent covers staggered so that the gases had to pass some distance over the surface of the covers in passing from one opening to the next, whereby it was hoped that some of the heat would be extracted by the metal covers. Although by this means the size of the openings could be made much larger than in the case of the single cover, it was still found that the results of an explosion inside depended on the same factors, and only in the case of the point of ignition being in close proximity to the opening could any cooling effect be noticed. Similar results were found to occur with the use of tubes in front of the openings, in passing through which it was hoped that the gases would be cooled. All these methods of protection were thus found to be unreliable, and had to be discarded.

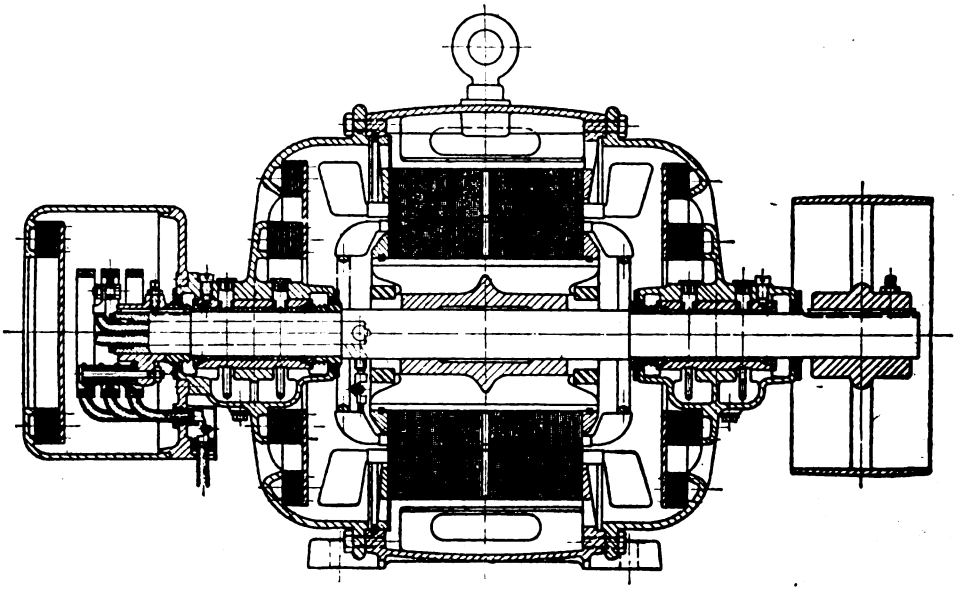
In order to combine the advantages of a ventilated motor with a reliable flame-proof protection, a series of experiments was carried out to test the efficacy of wire gauze, the utility of which in the case of the Davey lamp has stood the test of time. Steel, copper, and brass wire gauze were used in the tests, having 144 square openings to the square centimetre, with wires 0·35 mm. diameter, in which the openings cover about one-third of the total area. They are practically the same dimensions as employed in the safety lamp.

In the first place, the material of the gauze did not affect the result to any appreciable extent. As in the case of covers with apertures, it was found that the protection depends on the position of the point of ignition of the gas, and is also influenced by the configuration of the internal parts and the state of motion of the rotating parts. The effects of position of points of ignition were found to be entirely the reverse of the effects in the case of the enclosure with aperture. The danger of an internal explosion, being communicated to the outside, increased with the distance of the point of ignition and depended directly on the explosiveness of the gas. There appeared to be a relation between the minimum area of the gauze and the volume of the vessel. By adding layers of gauze (with a small intervening space between adjacent layers) the total minimum efficacious area of gauze is reduced. Thus for a certain vessel a single layer of not less than 455 sq. cm. was required, a double layer of $2 \times 176 = 352$ sq. cm. was sufficient, and a triple layer of $3 \times 41 = 123$ sq. cm. was still quite safe. By increasing the number of layers the ventilation is seriously impaired, while a single layer is very liable to mechanical injury, which might impair its mechanical strength.

When gauze protection is used it is of the utmost importance that no other openings or gaps are present, such as might occur through a badly fitting joint, as thereby the protection would be subverted. Even a hole in the gauze, caused by the removal of the little cross between four holes, was found to be sufficient to impair its efficacy and cause an explosion. A gap round a cover of 1 mm. width was found to be a source of danger. A gap not exceeding ½ mm. width and 50 mm. deep was found to be safe, as the hot gases, in passing the 50-mm. surface, were cooled sufficiently to prevent danger.

One of the greatest disadvantages of gauze protection was found to be the "burning" mentioned before, which although in most cases not sufficient to damage the windings, yet was enough to cause local heating and final destruction of the gauze at those points, with a consequent explosion.

From the observed fact stated above, that slits or gaps of not more than 0·5 mm. width and about 50 mm. depth are not sources of danger, finally a form of protection was devised which embraces all the advantages of gauze without its defects. It is the so-called "plate" protection. It possesses mechanical strength, permits of ventilation, prevents an explosion by cooling the issuing gases, and is not damaged by after burning should this phenomenon take place. It consists of a series of plate, usually ½ mm. thick and 50 mm. deep, placed side by side at a distance of ½ mm. from one another in openings of the motor or apparatus



Digitized by Google

casing. These plates are usually in the form of rings or hollow squares, but they can be any shape or size. Any number can be used, according to the amount of ventilation required, and the protection secured is independent of the position of the point of ignition, the relative volume of the containing vessel to the area of opening and of the composition of the gas. A drawing of such a motor is given below.

Summarising the above observations, the author said that of all the various methods proposed as protective devices, the use of a labyrinth enclosure, an enclosure pierced with pipes, and the so-called flange enclosing are totally unreliable as protective devices, and must be rejected as unsafe. On the other hand, the complete enclosure, the enclosure in wire gauze and the "plate" protection, afford reliable methods of protection, and can safely be adopted when suitably applied. To these he added oil immersion, which is mainly applicable to switchgear, junction boxes, and very small motors. The plate protection is, in the author's opinion, the most suitable enclosure for all motors.

As far as possible the electrical apparatus which is installed underground, and especially larger motors driving pumping plant, main and tail or endless haulages, winches, hoists, creepers, &c., which can be grouped close to the pit bottom, should be placed near the downcast shaft, in the neighbourhood of the main airways; or if in the neighbourhood of the upcast shaft, in separate chambers specially ventilated with intake air, so as to avoid the necessity of any special protective device against explosion.

Where, however, this is not possible, so that the motors and the switchgear must be placed in locations coming within the provisions of Rule No. 8 of the Coal Mines Regulation Act, then, the author contended, as far as possible plate protection should be provided on the motors; the windings should be enclosed in one enclosure, and any part (such as slip-rings) in which sparking is liable to take place in service should be enclosed in a separate enclosure, particular care being exercised to prevent any communicating passages between the two enclosed spaces, total enclosure being only adopted in the very smallest motors.

Motor with Plate Protection for use in Mines.

DISCUSSION.

Mr. Sam Mavor (Mavor & Coulson) said that although we must not exaggerate them, we must acknowledge that there were certain risks, and do our utmost to prevent them. While he could not go so far as to say that no serious mishaps had occurred with electrical plant, it was true, nevertheless, that there had been remarkably few. He regretted that the Home Office had not given us more guidance as to how to make motors safe; the experiments made by Mr. Garforth in 1903 had done little more than to show that a spark from a commutator, switch or other electrical device would ignite an explosive mixture of gas and air. Some time ago he had made a practice of hermetically sealing the communication between the two compartments of a switch and fuse-box, merely with a view to reduce the space in which a gaseous mixture could accumulate and the maximum pressure that could occur in it, and not for the reason pointed out in the Paper. Referring to the Author's remarks as to the total area of the vents in a motor-case, he asked whether the proper ratio between the area of the vents and the total free capacity of the case had ever been determined. He also wished to know whether the motor illustrated had been ascertained by experiment to be safe. He himself had for some time used several sheets of gauze placed above one another over each opening in the motor-case and separated from one another by distance pieces. Coal-cutters, he pointed out, represented a more difficult problem, because at the coal face sudden outbursts of gas were likely to occur. Openings in the case were impossible in such a situation, as coal dust would enter, and therefore they had to be completely enclosed. There might be a certain risk of explosion for the reasons explained in the Paper, but no accident had yet occurred with them. It must be remembered that the collier who used them was a skilled man, and he had always the indication of the safety lamp to guide him. Mr. Mavor also pointed to the danger of the plates in the form of protection described by the author becoming dented, so that a risk would be created by the minimum distance between them being increased.

Mr. J. Hally Craig (The Electrical Co.) said that a great deal of machinery had been designed without regard to the principles explained in the Paper.

Mr. George Stevenson insisted on the necessity of periodical inspection and cleaning, although he thought that a tiled motor-room was not absolutely necessary. If men were given good plant to start with, he said, they took sufficient interest in it to keep it clean and in order. He noticed that the author had said nothing about cables in the Paper, although they were as difficult to look after as other parts of the plant. He suggested that motors with fans in them might be now arranged so that air passed into the motor-case from the down-cast shaft, and was led out again to the up-cast shaft. A difficulty with the motor illustrated, he suggested, would be that it would be difficult to make the joints again after it had been taken to pieces for cleaning purposes. He also asked what was the effect of this design on the rating; that is to say, what would be the increase in output by using this "plate protection" instead of a totally enclosed motor. Mr. Stevenson also asked for particulars as to the experiments made with tubes placed in front of the openings in the motor-case. He concluded his remarks by stating that the whole Paper emphasised the importance of using squirrel-cage motors whenever possible, and he deprecated the use of air-break switches for mining purposes.

Mr. H. W. Clothier (A. Reyrolle & Co., Ltd.) regretted that there had not been more reference to switchgear in the Paper. He corrected the author's initial remark about the entire absence of electrically-caused explosions, and said that only a few weeks ago an explosion had occurred from a defective joint between a switch base and its cover. It was one of those in which a rubber ring was fitted in a groove, and the rubber jointing material had become displaced, leaving an aperture sufficiently large to explode the gas. To obviate this danger, his firm use a wide flanged joint on all their switches, machined so as to give a good metal-to-metal surface. The cover is clamped down by a number of bolts at fairly close centres, and if the arrangement is not actually gas-tight it would give practically a series of narrow slits, mentioned in the Paper as one form of protection. It was questionable whether oil-break switches should be used on D.C. circuits, owing to the rise of pressure that occurred when breaking under oil. He also said that it was not certain that the oil in itself would afford protection, as the flame can rise through the oil; and he had known cases in which switches had had their oil tanks actually blown off, and others in which the flame had come out between the switch and the oil tank. Oil was also messy to have in a switch in a mine, and, if the switches were far from the surface, the cleaning of the switch and replenishing the oil

Digitized by Google

would be liable to be neglected. He did not think the type of plate protection described would be suitable for switches, owing to the possibility of coal dust penetrating into the switch, and he preferred total enclosure and a wide flange metal-to-metal joint as explained.

Mr. A. H. Kelsall (Lancashire Dynamo & Motor Co.) said that more satisfactory cleaning of the motors was the most important point to be observed. He suggested that, in Mr. Mavor's method of using several layers of gauze with distance pieces between, the back layers could be of a coarser gauze.

Mr. J. A. Robertson (Burgh Electrical Engineer, Greenock) said that the user of electricity was greatly indebted to the designers of colliery apparatus, because the design of switches, &c., for colliery work had proved valuable in shipyards and similar places. He pointed out that the German experiments alluded to had not been made by the German Home Office, but by an association of manufacturers, and suggested that a similar course would be desirable in this country.

Mr. Clothier asked if the manufacturers had not been supported by a Government grant in the German case.

Mr. D. M. McKenzie asked whether the plate-protected openings in the motor described by Mr. Simon did not get choked with coal dust.

Mr. Simon, replying to the discussion, said that, at the time he wrote his Paper, the accident in the colliery at Featherstone, Yorkshire, alluded to by Mr. Clothier and inferentially by Mr. Mavor, had not occurred. So far as he remembered, however, investigations had pointed to carelessness in the use of the apparatus, that the switch was in a defective condition, and that the practice had been to remove the cover in order to operate it.

Mr. Clothier, interposing, said that Mr. Simon was misinformed; the rubber joint had been displaced, but otherwise the switch had been in perfect condition.

Mr. Simon, continuing his reply, answered some of the questions with regard to the plate-protected motor. The area of the openings were as far as possible in accordance with a standard design of carcase, in order that the motor should not have to be given a special length of shaft. The end shields were of the ordinary pattern, and the plate protection was made up in packets and inserted. The plates were fixed to the cover and came away inside it when it was removed, and, anyhow, the plates did not have to be reassembled. Being inside the cover, they were more or less protected from mechanical injury. For cleaning purposes, the end shields could be taken off at the end remote from the slip-rings and the dust could then be blown out. Such motors had been tried both in a test gallery and under actual working conditions with satisfactory results. In the case of gauze protection, figures had been obtained for the proper ratio between the area of the openings and the volume of the motor, both for single, double, and triple gauze, but he had not got the figures by him. Referring to the self-ventilating method suggested by Mr. Stevenson, he said that a similar arrangement had been adopted in textile mills to keep the temperature of the work-rooms even; in the case of mines the piping would have to be perfectly air-tight to prevent the gases being sucked in and carried to the motor. He had not dealt with cables in his Paper, as detailed regulations were given in the Home Office rules. The main point was that the metal sheathing of the cable should be continuous and earthed. It was advisable to provide sealing and dividing boxes for leading in to the motors and switches In reply to Mr. Stevenson's question, he said that the arrangement of tubes in front of the openings in the motor case had not been found to be effective. The use of squirrel-cage motors was not always possible, for, in such cases as main and tail haulage, staple winders and hoists, speed regulation was necessary.

THE EXPLOSION AT THE HAIGH MOOR COLLIERY

In our issue of February 4th we reported briefly the proceedings at the inquest in connection with the explosion which occurred at the Acton Hall (Haigh Moor) Colliery, Featherstone, near Pontefract, on January 21st. Previous to the inquest, a Home Office inspection had been made in the ordinary course, and the following facts were placed before the coroner. These were not made public at the time, but we are now in a position to place them before our readers.

A man, who subsequently died from the effects of the explosion, stated that he was in the act of switching off current from a small electric motor driving a ventilating fan, and this had first suggested the possibility that the explosion had an electric origin. An examination of the electric cables was first made. These were two small rubber-insulated unarmoured cables, each about five-eighths of an inch overall diameter; the only use for current in the neighbourhood was to drive the fan motor above referred to. The outer covering of the cables showed distinct evidence of scorching, due without doubt to the flame of the explosion. The cables conveyed direct current at 500 volts, first to a double-pole switch and fuse in a cast-iron box, then to a starting switch, also in a cast-iron box, and, lastly, to a 4-h.p. motor of the totally enclosed type. Each of these pieces of apparatus was designed to be "gas tight." The gas-tight glands through which the cables were led to each piece of apparatus appeared to be in order, and on removing the gas-tight covers of the motor and the starting switch no evidence could be found of the explosion having originated in either.

The main double-pole switch and fuse box was next examined. It consisted of a cast-iron box about five-sixteenths of an inch thick, and measuring about 3 ft. long by 8 or 10 in. wide, by 8 or 10 in. deep, within which was a double-pole switch and two fuse handles. The porcelain fuse handles were covered fairly thickly with dust. There was no clear evidence to the naked eye of general and widespread burning inside the switch box; though a piece of insulating material very close to one of the switch terminals had the appearance of having been burnt, an adjacent piece of cable showed no obvious sign, but the burning of the insulation indicated that the switch had been in the habit of arcing considerably in operation.

The method of securing a gas-tight joint between the lid and the body of box was then examined. The lid was provided with a recess, into which a piece of rubber measuring about three-eighths by three-sixteenths of an inch was laid, and this latter was supposed to fit on the top edge of the box, measuring, as above-mentioned, about five-sixteenths of an inch. The difficulty of ensuring that the rubber joint was in place was aggravated by the design of the lid, which was hinged along one side. According to the man who last made the joint between the lid and the box, the rubber ring could only be made to go the whole way round the top of box by stretching it, under which conditions it was practically impossible to secure a continuous rubber joint. There was clear evidence that the rubber ring was bearing properly in parts, but in parts only, and that gaps must have existed. The above evidence all tended to show that the joint was not gas-tight, and that the fatal explosion was caused by the spark at the terminals of the switch in opening the circuit of the fan motor.

LIVERPOOL CORPORATION TRAMWAYS

The report of Mr. C. W. Mallins, General Manager of the Liverpool Corporation Tramways for the year 1908, states that the number of passengers carried amounted to 121,927,883, the receipts to £563,144, and the mileage to 12,244,353. The comparison for the year 1908 with 1907 is as follows, viz.:— Passengers: Decrease 2,115,356, or 1·7 per cent. Receipts: Decrease £9,678, or 1·7 per cent. The average earnings per car mile amounted to 11·04d., as against 11·24d. for 1907. The General Manager is of opinion that the decrease in the receipts is principally due to the very great depression in trade experienced during the year, particularly as regards the shipping of the port, on which the prosperity of Liverpool so largely depends. In addition, during 1907, the Sept-centenary Celebrations were held, and his Majesty's Fleet visited the city, which caused an abnormal amount of traffic. The returns, therefore, are not quite comparable with those of 1907.

The question of insurance against third-party risks has received attention during the year at the hands of a sub-committee, whose recommendation that the policy hitherto taken out with the company should be discontinued, and the risks undertaken by the Tramway and Electric Power and Lighting Committee itself. In this connection it is gratifying to note that the number of collisions occurring during 1908 has been reduced by 196 compared with 1907.

On October 1st, 1908, a service of first-class cars was inaugurated, and between that date and the end of the year 112,321 passengers were carried, the receipts amounting to £1,202. During the year each of the car-sheds have been equipped with hanging platforms, which have been found to be of great practical use in connection with the cleaning of the upper part of the cars, in addition to reducing the possibility of accident and creating a financial saving. The stock of cars at present amounts to 534. With regard to accidents, 22 people who had been knocked down, or had fallen in front of cars, were pushed clear of the metals. There were eight fatal accidents, and a verdict of "accidental death" was returned in each case.

The total expenses amounted to £401,181, and the revenue, including receipts from advertising, &c., to £574,977. After meeting capital charges and contributing £24,858 to the rates, the sum of £49,716 is transferred to reserve, renewals, and depreciation account.

THE NATIONAL PHYSICAL LABORATORY

The General Board of the Laboratory met at Bushey House, Teddington, on Friday last, and several visitors were also present. After the meeting, at which the report of the work for the past year was accepted, the members of the Board, together with the visitors, made a general inspection of the laboratory.

The report for the past year contains a large amount of interesting information. In the Physics Department, much work has been done relating to the mercury standard of resistance and other standards, and a number of experiments have been carried out. Among these latter were some tests on current-transformers as used for instruments, to determine the ratio of primary to secondary current, and the angle of lag of

Digitized by Google

the primary behind the reversed secondary current for various loads and frequencies. A number of tests were made on samples of submarine telephone cable, for the purpose of investigating the attenuation and wave-length constants. Some tests have been made by a wattmeter method, on the total power loss in sheet iron due to hysteresis and eddy currents, the effect of wide variations in the form factor has been investigated. A wavemeter for use in wireless telegraphy has been calibrated for the Post Office authorities, and a standard wavemeter has been constructed, consisting of a variable air condenser, a set of self-inductance coils, and a thermo-ammeter.

In connection with the work of setting up electrical standards in the photometric department, progress has been made in the establishment of two sets of standard lamps of a higher efficiency, and therefore of whiter light than those commonly used for electric sub-standards. These run at 3·5 and 3·1 watts per candle respectively, and have been carefully aged before standardisation. Metallised carbon filament lamps made by the British Thomson-Houston Co. have been found most valuable for this purpose. Efforts are being made to obtain satisfactory metal filament lamps to give further steps down to 2 and 1·5 watts per candle. In this way it is hoped that, in the near future, reliable standards may be issued to those concerned with the photometry of metallic filament lamps. Very complete arrangements have been made during the year for systematising the tests on glow lamps to the Engineering Standards Committee specification, and a new equipment has been designed and constructed. The new electrostatic wattmeter which has been under construction in the laboratory workshop during the latter part of the year is now practically completed. A further valuable addition to the testing facilities is that of a second alternator coupled to the same shaft as the existing Siemens test alternator, its field being capable of rotation with reference to that of the first machine. This will enable varying phase displacements to be obtained between current and volts with single-, two- or three-phase circuits. The two alternators and the motor are now mounted on a single bed-plate. The variation of phase by rotation of the field is brought about by means of a small motor connected to a double reduction worm gear—allowing of control from a distance of the power factor of the circuit.

Considerable advances have been made in the equipment for high-tension work. The new Westinghouse 20-kw. 100,000-volt transformer has been working since September. The accurate measurement of the high-tension voltage has now also been arranged for. The apparatus consists of a 500-volt large dial voltmeter taking 0·2 amperes for full deflection, and capable of being used to an accuracy of two parts in 1,000. In series with this are 18 resistance boxes with a total resistance of 5 megohms, the whole being capable of connection across the 100,000-volt mains, and dissipating in all 2 kilowatts. By a special arrangement of H.T. multipoint switches, sections of this resistance are short-circuited, giving various ranges from 500 to 20,000 volts. For higher ranges than this the ratios are changed by special contact pieces across the boxes. For carrying out disruptive tests at different temperatures, a large electrically heated oven has been constructed.

The general test work has increased considerably. A number of the watt-hour meters tested had a range of from 1,000 to 2,000 amperes, and 400 to 600 volts. Among other instruments may be mentioned a precision type ammeter, tested to 8,000 amperes; and a standard shunt, the resistance of which was measured, and the temperature coefficient determined, with various currents up to 6,000 amperes. The tests on primary batteries mentioned in last year's report have been considerably advanced; there are at present 160 cells of various makes under test. In the electrical departments nearly 2,000 tests and measurements were made, as against 1,150 in the previous year. Over 720 incandescent lamps were tested, the corresponding number in the year 1907 being 400.

The new electric furnace-room has been completed, and is partially equipped. A new carbon-tube furnace has been devised by Mr. W. A. Price and Dr. Harker. In this furnace the carbon tube is retained as a lining only, the heat being supplied by current in a graphite spiral, surrounding but carefully insulated from the central tube. This furnace attains a temperature of 2,000° C. with 150 amperes at 40 volts, while the average life of the furnace is much greater than that of the older pattern. Three permanent furnaces, specially designed for verification of radiation pyrometers, have also been installed.

In the engineering department, a machine which has been designed for testing the tensile strength of long wires at varying temperatures, and for which funds have been provided by the Post Office, the National Telephone Co., and the India Office, is being constructed in the workshop and is now nearing completion.

LOCAL NOTES

ASHTON-UPON-MERSEY: *Tramways.*—Notice is given of the intention of the Council to lease to the Manchester Corporation some 2¼ miles of tramways in Ashton.

AUSTRALIA: *Tramways.*—A scheme of tramways between Prahran and Malvern (Victoria) has been adopted by the respective Councils. The length of the route is approximately 4½ miles, and about 2½ miles will be double track. A supply of electrical energy will be taken from the Melbourne Electric Traction and Lighting Co.

BELFAST: *Street Lighting.*—An experiment in street lighting is to be carried out by fixing flame arc lamps to the tramway centre poles.

BOOTLE: *Electricity Works.*—The members of the Liverpool and District Electrical Association paid a visit to the Municipal Electricity Works last week.

BOURNEMOUTH: *Tramway Receipts.*—The receipts of the Corporation tramways continue to decrease, and it is estimated that for the year ending March 31st there will be a deficit of about £5,000.

BRADFORD: *Third-Party Risks.*—The Tramways Committee are considering tenders for third-party insurance in respect of the tramways. Hitherto the committee have dealt with claims themselves.

CARDIFF: *Tramwaymen's Grievances.*—Trouble is again being experienced with the tramway employees at Cardiff, this time as the result of the dismissal of a conductor by Mr. Arthur Ellis, the Electrical Engineer and Manager. In fact, the men's Union went so far as to threaten a strike almost immediately should their request for a thorough inquiry into the matter be refused by the Committee.

This special meeting of the Committee was held on Monday, when, after hearing both sides, it was decided to confirm Mr. Ellis's action in the dismissal of the conductor.

CHORLTON: *Telephone Assessment.*—The Assessment Committee have appointed a valuer to re-value the telephones in the district. It will be remembered that the Assessment Committee recently won an action against the National Telephone Co., giving them the right to assess the company's undertaking in the district upon its earning capacity, and not, as hitherto, at a fixed rate per mile of wire.

CLEETHORPES: *Electric Lighting Order.*—In connection with the extension of time within which the Council is to put into force its electric lighting order, the Board of Trade have made several alterations in its provisions. Cables have to be laid in the compulsory area within twelve months, and the "Northumberland" clause has been inserted, providing that the charges during the first five years must be sufficient to meet the expenditure; in other words, there must be no rate-in-aid. A clause has also been inserted allowing the Council to purchase electricity in bulk, which opens the way to negotiations with the tramways company to this end.

CLITHEROE: *Electric Lighting.*—The Board of Trade have granted an extension of one year for putting their electric lighting Provisional Order into force.

DUBLIN: *Action against Tramway Co.*—An action is pending against the Dublin United Tramways Co., at the instance of a Mr. W. F. Thompson, who claims damages to the extent of £2,000 for personal injuries alleged to have been sustained by him owing to the company's negligence in not maintaining their tramway tracks in a fit and safe condition for public traffic. The wheels of a hackney carriage in which the plaintiff was travelling caught in a rut at the side of the tramway track, with the result that the plaintiff was thrown out and sustained serious injuries. In the King's Bench Division last week an application was made for certain documents to be handed over by the company, which was granted.

Position of Electricty Undertaking.—The Corporation have rejected the proposal of the Electric Lighting Committee to increase the charges for electricity for lighting purposes by 10 per cent.

DUNDEE: *Tramway Extension Rejected.*—The proposal to extend the tramways between Arclay Street and Clepington Road, at a cost of £12,000 (exclusive of overhead equipment), has been rejected by the Council in consequence of a report by the Tramways Manager that the tramways undertaking is not capable of maintaining any additional capital burden.

EDINBURGH: *Marine Gardens.*—The management of the Marine Gardens at Portobello have made an application for a supply of electricity by the Corporation. It is stated that the supply will probably amount to about £1,500 per annum. The matter has been referred to a sub-committee, as it involves the laying of a new main.

Electric Shock Regulations.—The Council have agreed to supply power consumers with cards containing regulations for treating persons suffering from shock. The new Home Office Regulations, it will be remembered, compel power users to have such regulations fixed in prominent places, and the Electric Lighting Committee consider that they should bear the cost of providing the cards.

GREENOCK: *Admiralty Supply.*—It is stated that the agreement with the Admiralty for a supply of electricity to the new torpedo works will be completed during the next few weeks, and

Digitized by Google

that the work of laying the necessary cables will then be commenced.

GRIMSBY: *Electricity Works Assessment.*—The Chairman of the Electric Lighting Committee reports that the Assessment Committee have increased the assessment of the electricity works from £665 to £3,037. He states that although there have been considerable extensions to the works since the last valuation, this increase is altogether disproportionate to the extensions. After some discussion, it was decided to consult an expert on the point.

GUERNSEY: *Telephone Accounts.*—The accounts of the Guernsey States Telephone Department for the year ended December 31st, 1908, show that the gross receipts amounted to £5,864, and the expenses to £2,015. After deducting depreciation account at the rate of 3 per cent., sinking fund, and a special sinking fund of 2 per cent., there is a net profit for the year of £380. The number of subscribers' lines is now 1,459, an increase of 54 during the twelve months.

HANDSWORTH: *Tramway Arbitration.*—Mr. H. Graham Harris has been appointed to settle the dispute between the City of Birmingham Tramways Co., Ltd., and the Council, as to the price to be paid for the portion of the company's undertaking in this district.

HERNE BAY: *Electric Lighting.*—At a meeting of the Ratepayers and Town Improvements Association last week, a resolution was passed, calling upon the Council to take a poll of the ratepayers before embarking upon an electric lighting scheme.

LLANELLY: *Electric Lighting and Tramways.*—The Council have transferred their Electric Lighting Order to a company, who will shortly proceed with the conversion of the old horse tramways to electric traction, and the erection of a generating station for the supply of light and power. The company in question are negotiating with the Llanelly Harbour Trust for the acquisition of a site for the generating station.

LONDON: *London County Council: Tramways.*—A system of through fares has been arranged between the London County Council and the Croydon Tramways Committee.

City of London: Street Lighting.—The sub-committee appointed by the City Council a short time ago to examine the various systems of street lighting left for the Continent last week.

Marylebone: Street Lighting.—As foreshadowed in an editorial note in our issue of March 11th, the Borough Council has decided to appeal to the Local Government Board against the decision of the London County Council refusing a loan of £8,000 for street lighting purposes. In the meantime the scheme is to be proceeded with.

Paddington: Tramways.—It is stated that, as the agreement between the London County Council and the Metropolitan Electric Tramways, Ltd., for the reconstruction of the Harrow Road tramways will have to be sanctioned by Parliament, and that therefore work upon it cannot be commenced until next July.

St. Pancras.—The Electricity Committee have considered the question of complying with the regulation respecting "earthing" of the neutral wire of the Council's mains. Mr. Sydney Baynes, the Chief Electrical Engineer, has pointed out the possible danger of strictly complying with this regulation, and considers it unnecessary. It appears that in most other metropolitan undertakings the requirements are met by the provision of an automatic cut-out in the earth circuit, which, as soon as a fault occurs, opens the earth circuit, and thus obviates the cessation of supply, which would otherwise take place. As the Board of Trade do not seem willing to waive their request, the Chief Electrical Engineer is experimenting with an automatic device to meet the case.

LOUGHBOROUGH: *Wiring.*—The Local Government Board has sanctioned a loan of £229 in respect of capital expenditure incurred to October 31st, 1908, for the wiring of consumers' premises. The loan is to be repaid in nine years.

Position of Electricity Undertaking.—Mr. J. F. C. Snell has made a report upon the position and working of the electricity undertaking, and has made a number of recommendations and suggestions. Mr. Snell is to make further recommendations after he has been supplied with certain data, which will not be available until after the close of the financial year ending March 31st.

MACCLESFIELD: *Electric Supply.*—The Tradesmen's Association have asked the Corporation to come to some decision as soon as possible as to whether it will inaugurate an electrical undertaking itself or give the necessary facilities to a private company.

MIDDLESBROUGH: *Trackless Trolley System.*—In a report upon the proposed adoption of the trackless trolley system, Mr. H. M. Taylor, the Borough Electrical Engineer, states that the company owning this system intends to equip an experimental line at Hendon, and that the Leeds Corporation is sending a deputation to inspect it. He trusted that Middlesbrough would do the same. This suggestion was adopted.

OLDHAM: *Tramways Assessment.*—The assessment of the Oldham Corporation Tramways has been reduced from £16,570 to £10,478.

PARTICK: *Electricity Committee's Tour.*—A deputation from the Electricity Committee is now making a tour of large cities in the United Kingdom owning electricity works.

PORTADOWN: *Electric Lighting.*—Schemes for the erection of electricity works have been placed before the Council by Messrs. Wilkins & Burden, of Dublin, and Messrs. Miller, Wilson & Pegg, of Belfast. After considering these the Council has decided to abandon any negotiations for the purchase of gas works. An electric lighting scheme is favoured by the Council should general support be given to it by those who would be large consumers.

PRESTON: *Electricity Supply.*—The Corporation have again had under consideration the proposed purchase of the undertaking of the National Electric Supply Co., Ltd. An expert is to be called in to advise as to the value of the undertaking.

RHYL: *Tramways.*—The poll of ratepayers with regard to the proposed light electric railway between Rhyl and Prestatyn, has resulted in a majority in favour of 386.

SAN PAULO: *Electricity Supply.*—The city authorities have granted permission to the representatives of the American General Electric Co. to establish a competitive service of electric lighting and power supply with that of the San Paulo Tramway, Light & Power Co., Ltd. The existing company, it is stated in the *Times*, opposed the grant of these new powers, and promised to reduce their prices.

SITTINGBOURNE: *Overhead Wires.*—The Sheerness & District Electric Power & Traction Co., Ltd., was summoned last week at the instance of the Board of Trade for erecting overhead wires to plans not approved by the Board. The wires in question were in existence from October 9th to November 6th last year, and it appears that a workman was killed by coming into contact with them. The company, who admitted the offence, was fined £10 for the first day, and 10s. for each subsequent day.

SUNDERLAND: *Power Company's Bill.*—A resolution has been passed by the Council deciding to oppose the County of Durham Electric Power Supply Bill in order to secure protection from a clause which, it is claimed, would allow the company to lay mains in Sunderland without the Corporation's consent.

The company, however, have since decided to amend the Bill so that it shall not apply to Sunderland, and on this understanding the Corporation has withdrawn its opposition.

TORQUAY: *Electricity Charges.*—The Electric Lighting Committee recommend the Town Council to adopt a flat rate of 4½d. per unit from March 25th. At present the maximum demand system is in use, and the proposed flat rate involves considerable reductions.

WOLVERHAMPTON: *Tramcar Life Guards.*—A child was knocked down and killed by one of the Corporation tramcars last week, due to the life-guard not dropping.

YARDLEY: *Electric Tramways and Supply.*—The Tramways and Electric Lighting Sub-Committee report the receipt of a cheque for £1,000 from the Tramways Co., which was the penalty in the event of failure to construct the tramways to Shirley and Olton within five years from 1903. The sub-committee is to visit Rugby and other places to inspect combined electricity generating works and refuse destructors.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

AUSTRALIA.—Two electric lighting schemes are before the Hawthorn (Victoria) City Council, one prepared by Mr. W. Corrin and the other by the Melbourne Electric Supply Co. Mr. Corrin's scheme estimates an expenditure of £80,720 for a limited area, £93,490 for an extended area, and £94,650 for the whole city. The Electric Supply Co. estimate an expenditure of £31,260, based on a supply for private lighting to 700 houses as against 3,900 houses by Mr. Corrin.

BRIDLINGTON.—A new boiler is to be purchased at an estimated cost of £700.

BURY.—A 2,000-kw. generating set is to be installed at an estimated cost of £1,500.

HASTINGS.—A Local Government Board inquiry was held on Tuesday into an application by the Corporation for sanction to borrow £5,000 for mains extensions.

INDIA.—The Lahore municipality propose to install an electric tramway system.

IRELAND.—Mr. F. C. Porte, of Cork, is promoting a local company for the supply of electricity to Fermoy with a capital of about £6,000.

LONDON: *Stepney.*—The Borough Council is to apply to the London County Council for sanction to borrow £10,000 for laying feeder mains from Blyth's Wharf to the western portion of the borough.

Miscellaneous

FAREHAM.—Tenders are invited for (1) mains, (2) transformers, (3) arc lamps and accessories. Particulars from Messrs. May & Hawes, Caxton House, Westminster, London, and tenders to the Town Clerk by April 22nd. (See advertisement this week.)

Digitized by Google

HULL.—An expenditure of £240 is to be incurred upon additional telephone cables.

LONDON: *London County Council.*—The Highways Committee recommend an expenditure of £200 upon feeder pillars in connection with the tramways.

PONTEFRACT.—Tenders are invited for an electric lighting installation at the Whitley Bridge Waterworks of the Corporation. Particulars from the Town Clerk, and tenders by April 3rd.

SWINDON.—Tenders are invited for (1) electrical and tramway equipment, accessories, fuses, and service boxes, &c.; (2) lubricating oils and grease; (3) direct-current meters. Particulars from the Tramways Manager and tenders to the Town Clerk by April 10th.

WEST HAM,—The Council have adopted a recommendation by the Electric Light and Tramways Committee for the borrowing of £15,000 for transformers, and £8,000 for motors to be hired out. These sums will cover the estimated expenditure under these headings for the next three years.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—Addition to the London Hospital Medical College, Turner Street, Whitechapel, for the Governors.

N.E.—Meeting hall, Tower Street, London Fields, Hackney. Builders, F. Gates & Son, 187 Queen's Road, N.E.

N.W.—Bank, Church Road, Great Stanmore, Hendon, for the London & South Western Banking Co. J. Luscombe, Manager, 170 Fenchurch Street, E.C.

S.E.—Electric Theatre, Sangley Road, Catford. Builder, J. Watt, The Lodge, Bromley Road, S.E.

S.W.—Bank of England Record Office and other buildings, Priory Lane, Putney. Architect, J. C. Radford, 223 Upper Richmond Road, S.W.

Factory for the British Incandescent Mantle Works, Ltd., Ravensberg Road, S.W.

W.C.—Building for the General Accident, Fire & Life Assurance Corporation, Aldwych, Strand. Architect, J. J. Burnett, 2 Montague Place, W.C.

PROVINCES.

AYR (N.B.).—Additions, Lorne Castle (£5.000). Architect, H. E. Clifford, 223 St. Vincent Street, Glasgow.

BARKING.—Police station (£9,660). J. Dixon Butler, Surveyor, New Scotland Yard, S.W.

BIRKENHEAD.—Additions, Isolation Hospital. C. Brownridge, Surveyor, Birkenhead Town Council.

EPSOM.—Fire station. E. R. Capon, Surveyor, Epsom U.D.C.

ERITH.—Tenders are invited for executing certain work during the year ending March 31st, 1910, in connection with the Council Assisted Wiring scheme. Particulars from the Engineer and Tramways Manager, and fee one guinea, returnable.

GLOUCESTER.—School (£9.000). J. Trew, Station Chambers, Gloucester.

HORSHAM.—Isolation Hospital (£2,500). Builders, Rowland Bros., East Street, Horsham.

ST. ALBANS.—Proposed Roman Catholic day-school for the Roman Catholic Community, St. Albans.

SALISBURY.—Church. E. D. Webb, The Gateway, Salisbury.

SHOEBURYNESS.—Public Hall and Council Chamber. H. Harris, Shoeburyness.

SHREWSBURY.—High school for girls (£8,000). E. C. Peele, Secretary, Shropshire Education Committee, Shrewsbury.

SOUTHEND-ON-SEA.—Club-house (£2,000). Secretary, Crowstone Yacht Club, Southend-on-Sea.

SWANSEA.—Centres for cookery, laundry, housewifery, and manual instruction at Danygraig (£5,400) and Terrace Road (£2,200) Schools. J. Thomas, Clerk, Swansea Town Council.

School, Glanmor (£21,000). J. Thomas, Clerk, Swansea Town Council.

WEYMOUTH.—Hotel. Architects, Crickmay & Sons, 13 Victoria Street, S.W.

Action re Damage to Cables.—In the Salford County Court on Friday, the Salford Corporation claimed £3 14s. for damage done to their cables by Duncan, Carmichael & Co., contractors. It appears that the damage was done by one of the contractors' labourers, who was engaged in opening up a drain in a schoolyard. The cables were lead-covered cables, laid in a concrete trough filled up with bitumen. The labourer drove his pick into this mass, but apparently did not reach the copper. For the defence it was urged that, although corporations were exempt from the conditions of the Electric Lighting Clauses Act of 1899, which compelled cables to be laid in such positions as to give proper access to drains, &c., the present cableway should have been laid underneath and not above the drain in question. The judge agreed with this, considering that the Corporation was guilty of negligence, and gave judgment for the defendants with costs.

TENDERS RECEIVED AND ACCEPTED

ACCRINGTON.—An order has been placed with Messrs. E. Green & Sons, Ltd., of Wakefield, for two economisers at £400.

BARKING.—The Council received the following tenders for the installation of mechanical stokers to four of the boilers at the electricity works, the prices being exclusive of the cost of unskilled labour and brickwork: Babcock & Wilcox, Ltd., £680; Bennis & Co., Ltd., £687 10s.; Erith Engineering Co., Ltd. (accepted), £695; Underfeed Stoker Co., Ltd., £712.

BELFAST.—The following are among the tenders accepted for the supply of stores during the coming year, for the Tramways Department—Cables, Messrs. Ward & Goldstone; wiring and cells, General Electric Co.

BIRMINGHAM.—The whole of the motor contract for the next twelve months, consisting of 240 motors varying from ½ h.p. to 50 h.p., has been placed with the Phœnix Dynamo Manufacturing Co. (This is claimed to be the largest municipal motor contract ever given out to one firm.)

CAPE TOWN.—The Phœnix Dynamo Manufacturing Co. are supplying a 100-kw. motor booster and switchboard to the Corporation.

CARDIFF.—An order has been placed with the Phœnix Dynamo Manufacturing Co. for two 300-kw. D.C. to single-phase motor-generator sets.

CROYDON.—The Council has accepted the tender of William Cory & Son, Ltd., for the annual supply of Welsh steam coal to the electricity undertaking.

The Guardians have accepted the tender of Pryke & Palmer for the supply of electrical fittings.

EAST HAM.—The Council have accepted the tender of Newton & Co., at £362, for motors and switchboard required in connection with the raising of the effluent at the sewage works.

LONDON: *London County Council.*—An offer by Messrs. Hadfield's Steel Foundry, Ltd., to supply for £590 the special track-work and check rails, &c., for the junction line at Gt. Eastern Street and High Street, Shoreditch, has been accepted.

Battersea.—The Council have accepted the following tenders for the annual supplies to the electricity undertaking:—Price's Candle Co., Ltd., oils; W. H. Willcox & Co., Ltd., engine-room stores (except packing); K. Beldam & Co., asbestos, &c., packing; The Sloan Electrical Co., Ltd., carbons for arc lamps, &c.; Electrical Co., Ltd., Nernst lamps and fittings; British Thomson-Houston Co., Ltd., incandescent lamps; Pryke & Palmer, ironmongery tools, &c.; Callender's Cable Construction Co., Ltd., bitumen.

Camberwell.—The Council have accepted the following tenders for annual supplies, &c.:—S. Burnby & Son, Maxim electric lamps, plain, 100 and 200 volts, 8 and 16 c.p., 6s. per dozen; 32 c.p., 8s. per dozen; frosted, 8–16 c.p., 6s. 6d. per dozen; 32 c.p., 8s. 6d. per dozen; "Tantalum" lamps, 100 volts, 8 and 16 c.p., 20s. per dozen; Osram lamps, 100 volts, no c.p. mentioned, 55s. 6d. per dozen. Electrical Engineering & Maintenance Co., maintenance of private telephones and electric bells, Town Hall, £5 15s. per annum; Grove Vale Depôt, £3 15s. per annum.

Islington.—The Guardians have accepted the tenders of Pryke & Palmer, and Baxter & Caunter, for the supply of electrical fittings and sundries.

Stepney.—The Council received the following tenders for condenser pipe work (partly subaqueous), settling tanks, valve chamber, and river wall, in connection with the "Blyth's Wharf" extension scheme; F. Handman & Co., £5,500; Daniel T. Jackson (accepted), £6,900; John Aird & Sons, £7,726; Perry & Co., Ltd., £7,890; Cochrane & Sons, £8,219; G. Webb & Co., £8,307 17s. 9d.; W. Muirhead & Co., £8,419 19s. 6d.; T. W. Pedrette, £8,900; Louis P. Nott, £8,953 17s. 4d.; William Rigby, £10,500; Pedrette & Co., £11,900; Deewra & Son, Ltd., £12,496; Mowlem & Co., Ltd., £12,901.

The Council have entered into an agreement with the Tudor Accumulator Co., Ltd., for the maintenance of a battery at Osborn Street station, for ten years, at £34 per annum, or 10 per cent. per annum on the cost of the battery.

SWANSEA.—The Council received the following tenders in connection with the electrical engineering equipment of the new technical college: 8-kw. experimental motor-alternator with special switchboard, Sunderland Forge & Engineering Co., Ltd. (accepted), £277; Crompton & Co., £330. Direct-current plant, with switchboards and accumulators, General Electric Co., Ltd., £200; Electric Construction Co., Ltd., £257. Alternating-current plant complete, with switchboard, General Electric Co., Ltd., £200; Electric Construction Co., Ltd., £210 11s.

WEST HAM.—The Council have accepted the following tenders for annual supplies of electrical fittings and accessories: Evered & Co., Ltd., Sunbeam Lamp Co., Metallic Seamless Tube Co., British Electric Manufacturing Co., E. M. F. Manufacturing Co., Siemens Bros.' Dynamo Works, G. Braulik, Electric & Ordnance Accessories Co., General Electric Co., J. H. Tucker & Co., W. T. Henley's Co., British Westinghouse Co., Armourduct Manufacturing Co., Simplex Conduits, Equipment & Engineering Co., Davis Electrical Co., Baxter & Caunter.

COMPANIES' MEETINGS AND REPORTS

LONDON UNITED TRAMWAYS.—The report for 1908 shows gross receipts amounting to £348,390, and working and general expenses, maintenance, and repairs to £220,252, leaving, with the balance brought forward from last account, a net revenue of £129,445. After payment of interest on debenture stock and loans for the year, and the payment of the dividend of 5 per cent. per annum on the preference shares for the first half-year and providing for income tax, there remains a balance of £30,170. Although this amount would have sufficed for the payment of the full dividend of 5 per cent. on the preference shares for the second half-year, the directors feel that the preference dividend should be limited to 2½ per cent. per annum for the present with a view to making provision for future renewals and the strengthening of the reserve funds, as stated in their circular of December 31st last. A dividend of 2½ per cent. per annum for the half-year ending December 31st has therefore been paid on account on the 5 per cent. cumulative preference shares, making 3¾ per cent. for the year, and the directors now propose to place £15,000 to the reserve fund for renewals, and to carry the balance of £326 17s. 8d. forward to the next account. With the amount now added, the reserve funds will total £39,168 6s. 5d. The gross receipts show an increase of £2,819, and the total number of passengers carried was 59,255,919, an increase of 529,939. During the present year the question will arise as to the company being required to sell to the local authority the four lengths of tramway within the Borough of Hammersmith. Although short in length, varying between one mile and one and a half miles only, these four portions of tramway are very important as forming the eastern terminals of the company's main lines and are all worked as parts of through routes. Any interference, therefore, with the company's possession, the directors state, would result in the public being deprived of the valuable privileges and services they now enjoy, so that, in the exceptional circumstances of the case, the directors have deposited a Bill in Parliament to postpone the period for any acquisition by the local authority. Under the Bill powers are also sought for mutual running facilities over some of the tramways of the company and the London County Council respectively that lend themselves to being operated as through routes for the greater convenience of the public.

At the meeting on Monday, the report and accounts were adopted. Mr. C. G. J. Cater Scott, the chairman, expressed his regret at the balance sheet. The main reason for the increase in expenses was the extra cost of coal, namely, £4,432, whilst repairs were also responsible for an increase of £2,816. On the other hand, the total receipts had increased only by £2,822. The company's trouble undoubtedly was the want of expansion of receipts, for the development of the traffic had certainly not come up to their expectations. For this he thought there were three reasons. First, the unfavourable weather. Secondly, the attraction of the Franco-British Exhibition, which had prevented people from patronising the line to the same extent as in the previous year, and, thirdly, motor-omnibus competition. With regard to the latter, he felt it was the company's duty to protest very strongly against this unlimited competition, which had arisen after they had spent large sums of money in obtaining their Parliamentary powers. A simple remedy, he thought, was the creation of a Traffic Board on lines recommended by the Royal Commission on London Traffic, for, by such means, he believed, tramway proprietors would be guaranteed a reasonable return for their money, whilst the public would be certain of a permanently good service.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION.—The report for 1908 shows gross receipts amounting to £37,014, and expenditure to £17,817, leaving a balance of £19,197, to which has to be added £2,479 brought forward. After providing for depreciation and interest on temporary loan from bankers, there remains the sum of £14,770, and the Board recommend a dividend of 5 per cent. per annum on the ordinary shares, carrying forward £1,770. At the end of 1908 there were connected to the company's mains the equivalent of 187,962 8-c.p. lamps, showing the substantial net increase for the year of 25,696 8-c.p. lamps. In addition, applications were in hand for 4,600 lamps not then connected to the circuit. The re-adjustment of the various capital accounts referred to twelve months back, and rendered necessary by the general order made by Mr. Justice Neville, on March 14th, 1908, to reduce the share capital of the company by the sum of £65,000, has now been completed. The units sold, which amount to 3,182,820, show an increase of 521,366, or 19·6 per cent. in excess of the previous year—the total costs per unit sold being 1·34d. as against 1·64d. in 1907—a reduction of 18 per cent. The ratio of total costs to revenue was last year 48·2 per cent.

At the meeting on Tuesday, the report and accounts were adopted. Mr. J. Atherton, the Chairman, stated that their total costs had been reduced from 1·64d. per unit to 1·34d. per unit, or 18 per cent., due mainly to the economies effected by gradual rebuilding and the improvements made upon the original boilers and plant. The increasing output demanded the installation of further plant, and an order was about to be placed for a 1,500-kw. turbo-alternator with condensing plant, which it was hoped to have at work by November next.

BRITISH INSULATED & HELSBY CABLES.—The report for 1908 shows that the profit for the year amounts to £195,852, in addition to £28,335 brought forward, making a total of £222,167. After deducting directors' and debenture trustees' fees, and interest on debenture stock, transfer to reserve account (£10,000), transfer to special reserve account (£17,000), transfer to patents and goodwill account, transfer to debenture stock redemption account, transfer to tools and drums account, dividend on preference shares to Dec. 31st, 1908, and interim dividend on ordinary shares to June 30th, 1908, there remains a balance of £81,004. A further dividend of 6s. per share on the ordinary shares, making, with the interim dividend already paid a total of 10 per cent. for the year ended Dec. 31st, 1908, is recommended, carrying forward a balance of £51,004.

At the meeting on Monday, the report and accounts were adopted. Mr. E. K. Muspratt, after dealing with the report, stated that a large addition had been made in the sales of tramway fittings and appliances, for which an additional brass foundry had been erected. A mill for rolling aluminium sheets was also in full working order, and furnaces and machinery for the manufacture of bronze wire had been provided.

WINDERMERE & DISTRICT ELECTRIC SUPPLY CO.—The report for 1908 shows a net balance of £2,060. After meeting debenture interest and an interim dividend of 1 per cent. on the preference shares, £600 has been transferred to depreciation, and a further 1½ per cent. dividend is to be paid upon the preference shares, leaving £33 to be carried forward.

DIRECT SPANISH TELEGRAPH CO.—At the annual meeting last week, the report and accounts given in our issue for March 11th were adopted. The Marquis of Tweeddale, who presided, attributed the decrease of £1,104 in the traffic receipts to the general depreciation in trade, as well as to the fact that no exceptional events of international importance occurred last year, as was the case in 1906 and 1907.

CITY OF LONDON ELECTRIC LIGHT CO.—At the annual general meeting last week the report and accounts given in our issue for March 11th were adopted. Mr. J. B. Braithwaite, who presided, said that during the coming year the capital expenditure, unlike that of recent years, would increase somewhat, owing to the necessity for providing a new generating set, and to make certain other alterations at the works. It was satisfactory, however, that they would be able to meet this expenditure without any further issue of capital. Although the gross revenue had increased by £2,379, owing to increased expenditure, the net revenue had decreased by £55,622, which was largely accounted for by coal. However, they had since placed their coal contracts on considerably improved terms, right through to the summer of next year. Although there had been a decrease in the net revenue, the amount available for dividends was increased by nearly £7,000 over that for the previous year, due to several large items which appeared last year not occurring again, such as heavy Parliamentary expenses, and the cost of the experimental street lighting. At the close of his speech, Mr. Braithwaite gave the details of the London Electric Supply Act of 1908, and stated that the directors were perfectly satisfied with the position thus created.

HASTINGS & DISTRICT ELECTRIC TRAMWAYS CO.—At the annual general meeting held last week, the report and accounts given in our issue for March 11th were adopted. The chairman, Mr. E. C. Morgan, stated that the past year had been an exceedingly disappointing one, there being both an increase in expenses and a reduction in receipts. The increase in expenses was partly due to maintenance and repairs, owing to the necessity for extensive repairs to the track. But the principal item of increase was the maintenance and upkeep of the Dolter system on the front, the cost of which up to the present had been borne by the directors. They would remember that they were prevented by the Corporation from having overhead wires on the promenade, with the result that they had been forced to use the Dolter system. The expenses of this, however, had proved far in excess of what they had been led to expect. During a period of nearly twelve months they had to remove no less than 1,068 dead studs, and although they had been able to introduce some economies, he feared that this portion of their line would always prove unduly expensive. The receipts had diminished by £1,535, although the receipts per car mile were larger than they were in 1907. He did not think they would attribute this to any slackness in the management of their business, as the decrease in traffic receipts of tramway undertakings had been almost universal during 1908. With regard to the future, their main anxiety was to reduce expenses, a most important item in which was the cost of coal. Being under very stringent regulations with regard to smoke, they had hitherto been compelled to use the most expensive quality of Welsh coal, but arrangements had been made with Messrs. Babcock & Wilcox for the installation of four chain-grate stokers, which, it was explained, would enable them to use a much cheaper class of coal. Another of their efforts to reduce expenses was the sinking of a well in order to avoid the heavy cost of water. With regard to increasing the receipts, they were in negotiation with the Corporation for an alteration in the fares, which were at present the result of an agreement between the Corporation and the original promoters of the company. But they had always thought these fares too low, especially upon their principal routes.

PARLIAMENTARY INTELLIGENCE

PROGRESS OF ELECTRICAL BILLS.—The South-Western and Isle of Wight Junction Railway Bill was read a second time in the House of Lords on Wednesday last week.

The Anglo-Argentine Tramways Bill was read a third time and passed in the House of Lords on Monday. The North Metropolitan Electric Power Bill was read a third time in the House of Commons on Monday.

ELECTRIC LIGHTING ACTS (AMENDMENT) BILL.—This Bill, of which we gave full particulars in our last issue, was read a second time in the House of Lords on Wednesday last week.

LIVERPOOL TRAMWAYS.—The Tramway Bill of the Liverpool Corporation came before a House of Lords Committee last week, and was ordered to be reported for a third reading. The Bill contains proposals for the construction of six new tramway routes at an estimated cost of about £100,000.

THE NATIONAL TELEPHONE CO.—Replying to Mr. Summerbell in the House of Commons last week, the Postmaster-General stated that he was not in a position to make any statement with regard to the negotiations with the National Telephone Co. for the construction of plant designed for use after 1911. Of course, the Company had to provide for the normal growth of their business during the remainder of their license, but he could not compel them to replace obsolete or worn-out plant. If no satisfactory arrangement could be made with the Company, the Post Office would have to undertake to provide for the service after 1911.

In answer to a further question on this subject on Tuesday, the Postmaster-General stated that, as the Company was bound to continue to meet all new applications for telephone service until the conclusion of their licence, he ventured to hope that it would not be necessary to carry out the numerous discharges which were the subject of so many alarming rumours at the present time.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 5s. to £58 15s. per ton. (Last week, £56 10s. to £57.)

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A meeting of the Municipal Electric Light & Power Corporation, Ltd., will be held at 37 and 39 Essex Street, Strand, on April 20th, at 11 a.m., to hear the liquidator's report of the winding up.

Messrs. Bridgewater & Wright, electrical engineers, of 78 York Road, King's Cross, London, have been adjudicated bankrupts. The date of the first meeting of creditors is April 2nd at noon, at the Bankruptcy Buildings, Carey Street, London, and the public examination will take place on April 28th at 11.30 a.m. at the same address.

BRUCE, PEEBLES & CO., LTD.—Messrs. Bruce, Peebles & Co., Ltd., are in a position to take in hand orders at once for La Cour motor-converters, and for motors and dynamos, at their well-equipped works at East Pilton, Edinburgh.

"PHŒNIX" CONTRACTS AND ORDERS.—Among the orders secured by the Phœnix Dynamo Manufacturing Co., Ltd., during the last two months are the following:—For a large flax mill in Belfast: 42 three-phase motors, averaging 10 h.p. each. For the Cape Town Corporation: 100-kw. motor booster and switchboard. For the Cardiff Corporation: Two 300-kw. D.C. to single-phase motor-generator sets. For the Birmingham Corporation: The whole of the motor contract, comprising 240 motors varying from ½ h.p. to 50 h.p. in size (this is the largest municipal motor contract ever given out to one firm). For a large firm of cocoa manufacturers: Slow-speed generator for coupling to gas-engine output, being 368 kw. at 160 r.p.m., and motors. For a large gas-engine firm: Slow-speed generator for coupling to gas engine for their works plant, output 160 kw. at 150 r.p.m. For the Liverpool Corporation, Darlington Corporation, and for local electric lighting companies in South Wales and Herefordshire: Various motors, generators, and boosters. For the Birmingham University and Manchester and Dewsbury Technical Colleges: Plant, consisting of special motor alternators, boosters, and transformers. In addition to the above they are completing the manufacture of a turbo-generator of 600-kw. direct current and four special motors, each of 250 h.p., for a concern in the north. The company report that January and February were very good months with them for orders, that they have over 400 machines on order at the present moment, having a total h.p. of considerably over 10,000. They are commencing upon an extension of their works, and have recently placed orders for more machinery to enable them to cope with the continued increase in their business.

LONDON ELECTRIC FIRM.—We are informed that the London Electric Firm, George Street, Croydon, have recently received a large number of orders for their "one-working part" arc lamp lowering gear and self-sustaining winches, including 1,000 sets for the Westminster Electric Supply Corporation, 1,000 sets for various Government dockyards, 200 sets for the L.C.C., 140 sets for the Tottenham and Edmonton street lighting, 140 sets for the Croydon Corporation, 350 sets for the Buenos Ayres & Pacific Railway, 100 sets for the Wimbledon Council, and orders ranging from 10 to 80 sets from a number of municipalities, railway companies, &c.

TANTALUM LAMPS.—Messrs. Siemens Brothers Dynamo Works, Ltd., inform us that on Friday, April 2nd, their incandescent lamp and fittings department will be removed to much larger premises at Tyssen Street, Dalston, N., in order to cope more effectively with their increasing business. All communications referring to the above matters previously addressed to 6 Bath Street, City Road, E.C., should after that date be sent to their new address at Dalston. It has for some time been an open secret that the company have practically completed a large works for the manufacture of tantalum lamps at Dalston, from which an output of British-made lamps on a considerable scale may be expected very shortly.

THE SANTONI ARC LAMP CO.—We are informed that the Globe Electrical Co. has been formed, and is about to be registered to carry on the business of the Santoni Arc Lamp & Engineering Co., Ltd. All the assets, including the stock-in-trade, of the old company have been acquired, and all orders can be dealt with promptly. The London address is 11 Farringdon Avenue, E.C.

UNION ELECTRIC CO.—The Union Electric Co., Ltd., of Park Street, Southwark, have been awarded a first-class diploma for trade and municipal appliances for their exhibit of arc lamps and motors at the Sheffield Smoke Abatement Exhibition.

MISCELLANEOUS CITY NOTES

BRITISH ALUMINIUM CO.—The Company proposes to create new debentures to the extent of £240,000 5 per cent. redeemable mortgage debentures of the Loch Leven Water & Electric Power Co. The debenture-holders have already given their approval to the proposal.

METROPOLITAN ELECTRIC TRAMWAYS.—A dividend of 4½ per cent. on the ordinary shares is recommended for the year 1908.

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the register:—British Blahnek Arc Lamp Co. and the Electrical Investment Syndicate.

The name of the London-Provincial Electrical Co. will be struck off the register within three months unless cause is shown to the contrary.

KRIEGER ELECTRIC CARRIAGE SYNDICATE.—Before Mr. Justice Parker in the Chancery Division, on Saturday, a resolution passed by this company for the reduction of its capital from £100,000 to £72,250 was sanctioned.

APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. E. H. Hewlett, Electrical Engineer at Mansfield, has been increased from £250 to £275 per annum.

Mr. R. B. W. Pirie, who has been chief accountant of the Clyde Valley Electric Co. since its inception, is leaving shortly for Vancouver to take up an appointment as chief internal auditor to the British Columbia Electric Railway Co.

A clerk of works is required in connection with the erection of the new generating station of the Bury Corporation; salary, £3 per week. Applications to the Borough Engineer, Mr. A. W. Bradley, by April 2nd.

Private Telephone Wires.—The action by the Postmaster-General against the National Telephone Co., in which he claims a monopoly in the matter of private telephone wires, and consequently a royalty from the company, came before the House of Lords on Monday, but at the close of arguments judgment was reserved.

Canadian Telegraph and Telephone Systems.—Under the Canadian "Dominion Railway Act," all telegraph and telephone companies in Canada must now submit their tariffs and arrangements for working to a Government Board for approval. As the Provincial Governments have in some cases bought out the companies owning the telephone lines, it is quite possible that the above measure is only a preliminary step towards ultimate acquisition of telegraphs by the nation.

Telegraph Traffic and Movements of Cable Ships.—The submarine cable between Tenedos and Lemnos was interrupted on the 19th inst. The landlines of the Indo-European Telegraph Company were restored to working order on the 20th inst., after a short interruption on that day. A very quick repair was effected of the Tenedos-Lemnos cable on the same day, which points to the break being somewhere near the shore. The French Cable Co.'s route to the Guianas and Brazil is still awaiting repair. The cable steamer *Minia* was engaged on a repair in the neighbourhood of Newfoundland recently, whilst the cable steamer *Mackay Bennett*, since her overhaul, has not had occasion to leave Halifax, N.S. The cable steamer of the Campagnie Française des Cables Télégraphique, the *Amiral Caubet*, repaired the company's New York-Haiti cable in the vicinity of New York.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 18th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

3,995/08. **Electrolytic Meter.** W. M. Mordey and G. C. Fricker. Polarisation, which causes serious errors in shunted meters working on light loads, is compensated for by inserting a resistance with a high temperature coefficient in series with the meter. This resistance is heated by its own current or by heat produced by a resistance in the main circuit, so that the current through the cell at heavy loads is decreased in the same proportion as it is decreased at light loads by polarisation. Eight claims, four figures.

13,787/08. **Mercury Motor Meter.** British Thomson-Houston Co., F. W. Carter, and A. J. Martin. This invention relates to meters of the pattern described in Electrical Engineering, Feb. 18, p. 157, in which the armature is in the form of a disc or an inverted cup, immersed in mercury. To improve the torque, the pole-force of the permanent magnet is heart-shaped, the point of the heart being opposite that point of the cup or disc where the current is concentrated, and the broad end of the pole opposite that part where the current is more distributed. Two claims, five figures.

14,537/08. **Flat-iron Heater.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*) Instead of the flat-iron being connected to the circuit whilst in use, it is heated on a stand. The heating grid is in the iron, and the contact pins slide into spring clip-contacts provided on the stand, which is inclined, and constructed of a heat-insulating material. On placing an iron on the stand, it slides down and completes the circuit automatically. Two claims, two figures.

19,118/08. **Supports for Metal Filaments.** T. McKenna. (*Glühlampenwerk Anker Ges.*) To prevent the filaments sticking to the metal supporting hooks, the latter are coated with a lower oxide of tantalum or niobium. The iron or nickel hooks are dipped in colloidal tantalic or niobic acid, dried, and then heated to about 1,300°C. in a current of hydrogen to convert the coating into the required oxide. One claim.

26,053/08. **Aerial Telephone Cable.** C. E. Egner and R. F. Fredriksson. The conducting wires are enclosed in a lead sheathing, and the steel supporting wire is also enclosed in lead; this latter sheathing is integral with the cable covering, being pressed on at the same time. Two claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Holman, 2,261/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Beaver and Claremont [Cable accessories] 6,477/08; W. T. Henley's Telegraph Works Co. and Pfiffner [Cables] 9,790/08; Peterson, and Callender's Cable & Construction Co. [Submarine cable] 11,163/08; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Lightning arresters] 18,619/08; Jackson [Distribution system] 26,120/08.

Dynamos, Motors, and Transformers: Felten & Guilleaume Lahmeyerwerke Akt.-Ges. [Direct-current machinery] 26,607/07; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Machines] 5,974/08; Soule [Control of motors] 28,017/08.

Electrometallurgy and Electrochemistry: Friedheim [Electrolytic deposition on hollow articles] 4,744/08.

Ignition, Electric: New Ignition Syndicate, Ltd., Rouse and Sandy [Battery connections] 11,610/08; Cleveland (*Backe*) [Distributors for ignition systems] 17,033/08.

Incandescent Lamps: Rock [Lamp-holders] 10,773/08; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Filaments] 14,867/08; Kremenezky [Process of sealing filament carrier into bulb] 18,278/08; Siemens & Halske Akt.-Ges. [Metal filament lamps] 21,385/08.

Switchgear, Fuses, and Fittings: Atkinson and Garside [Controllers or switches] 4,962/08; Jordan [Fuses for blasting purposes] 6,079/08; Vernum [Terminals] 7,565/08; Conradi [Luminous switches] 12,225/08; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Electromagnetic relays for motor control] 12,684/08; Lohay [Control of mechanism from a distance] 14,431/08; Dickson [Thermal switches] 19,906/08; Tiffany [Switch] 22,210/08.

Telephony and Telegraphy: Fessenden [Production of high-frequency oscillations] 28,647/07; Siemens & Halske Akt.-Ges. [Telegraphs applicable to fire-alarms] 16,446/08; Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Automatic telephone exchanges] 19,509/08; De Forest [Wireless communication] 20,206/08; Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Telephone exchanges] 24,330/08.

Traction: Saunders, Davis, and Griffiths [Signalling] 98/08; Pringle [Brakes] 4,646/08; British Thomson-Houston Co. and Park [Track brakes] 4,857/08; Peacock [Operating points] 11,264/08; Siemens Bros. & Co. (*Siemens & Halske*) [Relays for signalling systems] 17,348/08; Barnes [Signalling] 17,686/08.

Miscellaneous: Upward [Electric clock systems] 4,689/08; Krüger [Foot-warmers] 8,148/08; Bénard [Electrically controlled gas valves] 13,772/08; Siemens Bros. Dynamo Works and Grimston [Search-lights] 14,657/08; Webber [Driving mechanism for clockwork] 16,701/08; Goldschmidt [Production of high-frequency currents] 17,835/08; Chetwynd, Kelvin & James White, Ltd., and Clarke [Compasses] 18,509/08; Christensen [Lightning conductor] 24,259/08; Beck [Choke coils] 26,165/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Röchling'sche Eisen und Stahlwerke Ges., and Rodenhauser [Induction furnaces] 18,513/08; Akt.-Ges. Brown, Boveri et Cie. [Commutation of variable voltage dynamos] 20,786/08; Couade [Servo-motor] 2,374/09; Storer [Armature windings] 3,831/09; Leopold [Ignition of gas-lamps] 3,941/09; Soc. Francaise Electrolytique [Extraction of metals] 4,558/09 and 4,574/09; Maschinenfabrik Oerlikon [Single-phase commutator motor] 4,652/09; Allgemeine Elektricitats Ges. [Protective devices for A.-C. systems] 4,705/09; Lay [Railway signalling] 4,772/09.

Grant of Patent Refused

As the result of opposition, the grant on the following application has been refused.

461/08. **Support for Metal Filaments.** C. H. Stearn and C. F. Topham. A steel support, flat in the plane of the filament loop, has a hook at its extremity which engages with the end of the loop. Lateral torsion of the filament is prevented, but longitudinal expansion is taken up by the flat spring.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: C. E. Foster [Hot-wire regulating mechanism] 24,863/01; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Magnet coils] 26,457/05.

Distribution Systems, Cables and Wires, Insulating Materials, &c.: C. J. Grist [Insulating material] 25,286/98; E. A. Claremont [Impregnated insulating material] 21,804/00; F. W. Howorth (*F. Eeerhart and J. Dossert*) [Cable coupling] 26,174/05.

Dynamos, Motors, and Transformers: C. D. Abel (*La Soc. Anon. pour la Transm. de la Force par l'electricité*) [Rotary converter] 25,314/98; C. A. Ablett [A.-C. commutator motor] 26,272/02; C. de Kandó [Cascade connections for polyphase motors] 26,477/02; W. L. D'Olier [Vertical motor for hydro-extractor] 26,247/05.

Electrometallurgy and Electrochemistry: J. Hargreaves [Treatment of sewage with electrolytic chlorine] 25,064/95; W. Bein [Electrolytic apparatus] 24,058/99; W. Garroway [Electrolytic preparation of basic ferric sulphate] 26,314/05.

Incandescent Lamps: M. Clemmson [Lamp caps] 26,818/02.

Instruments and Meters: E. A. Carolan (*General Electric Co., U.S.A.*) [Recording mechanism for instruments and meters] 26,647/02; C. W. Atkinson [Electrolytic prepayment meter] 26,268/03.

Storage Batteries: A. Bainville [Electrodes] 24,511/01.

Switchgear, Fuses, and Fittings: J. Sachs [Fuse plug] 24,557/01; British Thomson-Houston Co. (*E. M. Hewlett*) [Overload and reverse-current circuit-breaker] 24,804/01; J. G. Statter [Switchboard construction] 26,420/02.

Telephony and Telegraphy: M. Byng and G. L. Anders [Telephone switch mechanism] 26,917/02; C. J. Andersson [Microphones] 26,111/03.

Traction: F. B. Behr [Mono-rail vehicles] 27,549/96; British Thomson-Houston Co. (*S. H. Libby*) [Pneumatically-operated contact shoes] 23,737/99; A. J. Boult (*W. J. Richards*) [Control of air-brakes] 24,512/01; G. Bleynie and T. Ducousso [Signalling system] 24,820/01; A. Honey [Electromagnetic device for increasing adhesion] 26,557/02; C. de Kandó [Control of collector-bow] 26,967/02; T. Stewart, W. Turner, and R. Dixon [Electrically-operated tramway points] 26,124/05.

Restoration of Lapsed Patent

An Order has been made restoring the following patent.

1,499/04. **Ignition System.** L. J. le Lorrois. Two or more sparking-plugs in each cylinder are connected to transformers, the primaries of which are supplied with currents differing in phase from a polyphase generator. A form of generator with displaced permanent-magnet pole systems and a rotating inductor is also claimed.

"ELECTRICAL ENGINEERING," ALTHOUGH THE CHEAPEST ELECTRICAL PAPER (PRICE **1d.** WEEKLY), CONTAINS THE MOST USEFUL AND PRACTICAL ARTICLES, THE BEST ILLUSTRATIONS, AND THE LATEST NEWS. IT IS READ BY THE LEADING ELECTRICAL ENGINEERS, AND IS REGARDED AS A RELIABLE AUTHORITY IN ALL MATTERS CONNECTED WITH THE ELECTRICAL INDUSTRY.

SUMMARY

MR. W. P. J. FAWCUS, one of the early workers in the electrical industry, died last Sunday. (Page 297.)

THE report and accounts of Messrs. Willans & Robinson for the half-year to December 31st, 1908, show a net sum available for distribution of £21,266. After meeting the dividend on the six per cent. preference shares and paying interest on and partly redeeming funding certificates, it is proposed to carry the balance of £1,470 forward, no dividend being declared upon the ordinary shares. Mr. Mark Robinson has had to resign his position as chairman owing to ill-health. (Page 298.)

IN a Paper presented to the Institution of Electrical Engineers last Friday, Mr. J. H. Rider gave a very complete description of the electrical system of the L.C.C. tramways, describing the plant and the whole system in great detail. In the discussion, which will be continued to-night, Mr. Frank Bailey, of the City of London Electric Lighting Co., spoke chiefly on the condensing water and boiler-feed arrangements; Mr. B. N. Jenkin (of Kennedy & Jenkin) hinted a doubt as to the desirability of employing induction motor-generators in the sub-stations owing to their low power-factor; and Mr. Martin Roberts, of the Post Office, touched upon a few other points in the Paper. In the Paper itself, a matter of fairly wide interest is the description of the troubles experienced owing to excessive rise across the coils of the motor-generators on switching in, and the manner in which this has been remedied by specifying a particular winding in the later machines and inserting a choking coil when switching in. An automatic switching arrangement for preventing heavy local currents between the generators through the earthing connections on the central points of the stators was also described for the first time. (Page 299.)

AN article on "Track Brakes," by Mr. H. M. Sayers, compares and discusses the tests recorded in the Brake Reports of the two Tramway Associations, on track brake blocks of different materials, and shows that, while the question needs further investigation in certain indicated directions, practical experience and the test results taken together support the general use of wooden blocks for the control of speed on steep gradients. (Page 303.)

Digitized by Google

The owners of the Ilgner patents relating to the electric driving of reversing rolling mills, have commenced proceedings against the Electrical Construction Co. for infringement, and application has been made by James Gray, Managing Director of the Electrical Construction Co., for the revocation of the patents. The owners of the patents, the Donnersmarkhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges., objected to filing their declarations in answer to the application, holding that the applicant should first make out his case. After a special hearing, however, the Comptroller has decided that this is not necessary, and has called upon the patentees to leave their declarations. We give brief extracts of the two patents, for the revocation of which application has been made. The first is for the method of driving a reversing rolling mill with current from the dynamo of a flywheel motor-generator set, and the second is for means of obtaining a speed variation of the flywheel set wider than that due to the inherent properties of the motor. We also give a few details of the equipment of the reversing rolling mills put in by the Electrical Construction Co. at the works of Messrs. Alfred Hickman, Ltd. In the power-house for these, Premier gas-engines are employed, utilising blast-furnace gas. (Page 305.)

Delivering a judgment in an appeal last week against a decision of the Comptroller-General of Patents, revoking a patent under the new Patent Act, Mr. Justice Parker discussed what, in his opinion, was the intention of the legislature under the revocation clause, and also criticised the rules under which applications for revocations have to be made. His view as to the desirability of alteration in the present procedure is opposed to that expressed by the Comptroller. (Page 314.)

A letter has been received from Mr. A. M. Taylor containing a reply to Mr. R. Orsettich's communication relating to Mr. Taylor's recent Paper on the application of batteries to transmission lines. (Page 306.)

The overhead equipment of the L.B. & S.C. Railway between the Peckham Rye and Battersea Park stations is now complete, and the test runs and the training of the motor-men will be commenced shortly. The members of the Junior Institution of Engineers visited Denmark Hill station on Saturday and inspected the switch-cabin there, and also the complete three-coach train with which trial runs are now being made. We give some further details of the equipment, in particular the means adopted for preventing access to the high-tension gear unless it is earthed. (Page 307.)

A conveniently arranged switchboard for a small private laboratory where various groupings of the cells are required is described in a short article. (Page 308.)

We give some particulars of a line of small generating sets driven by paraffin-oil engines, and a new pattern of three-phase induction motor with self-contained starting resistance is also described. (Pages 309 and 310.)

Among the patent specifications published by the Patent Office on Thursday is one by Siemens Bros. & Co., for a relay for railway signalling apparatus, which is unaffected by alternating currents or ordinary direct currents, responding only to a series of unidirectional impulses. Copper supports for metal filaments, which are provided with steel cores to strengthen them, are patented by the Siemens & Halske Akt. Ges., and the British Thomson-Houston Co. have protected an improved process for the manufacture of "metallised" filaments. The improvement consists in roughening the carbon core before depositing the graphite skin. Opposition has been entered to the grant of patents to S. O. Cowper-Coles for galvanising apparatus, and to W. Timbrell and C. E. Gabriel for a life-guard for tramcars. A patent for a system of block signalling for railways expires this week after a life of fourteen years, and two patents for brake-shoes, which had been allowed to lapse, have been restored. (Page 311.)

The first festival dinner of the Electrical Trades' Benevolent Institution was held on Tuesday, under the chairmanship of Mr. W. M. Mordey, who was supported by Mr. R. K. Gray and Mr. J. H. Rosenthal. Mr. Mordey, who explained that the institution was not for the benefit of workmen, but for the higher grades in the electrical industry, announced that the sum of £220 had been collected at the dinner, and that the total sum at their command was £2,591. He also pointed out that this fund and the benevolent fund of the Institution of Electrical Engineers were in no way competitors, and he threw out the suggestion, in his private capacity, that there should be co-operation between the two. (Page 313.)

Alderman George Pearson, the chairman of the Bristol Electricity Committee, has been awarded £30 damages in a libel action against a local publication.—Mr. Howard Smith, of London, has been retained to report upon the condition of the Cardiff tramway track.—A poll of the Hythe ratepayers has resulted in a majority against the use of the overhead trolley system.—The running of "first-class" tramcars in Liverpool has proved a failure.—The Highways Committee of the London County Council recommend that notice should be given of the Council's intention to purchase the sections of the London United tramways which are within the County of London.—An endeavour is to be made by the London County Council to obtain the consent of the Board of Trade and Commissioner of Police for sanction to run trailer cars for passenger traffic. (Page 314.)

Large extensions of the generating plant are contemplated at Brighton, and similar extensions to the value of £30,000 are recommended at Walsall. Extra high-tension and low-tension cables are required at Blackpool; underground conduit cables at Edinburgh; a motor-driven pump at Belfast; and cables, electricity meters, and arc lamp carbons at Glasgow. A Local Government Board inquiry was held at Lowestoft with regard to a loan of £2,000, and another at Hastings for £5,000, for electrical purposes. (Page 315.)

At the meeting of the Newcastle-upon-Tyne Electricity Supply Co. last week, it was stated, in answer to criticisms on the question of depreciation, that the company was really meeting this out of revenue. The report of Messrs. Vickers, Sons & Maxim for 1908 allows of the payment of a dividend of 10 per cent. on the ordinary shares, and the carrying forward of £186,672. (Page 317.)

There is already an important difference of opinion between the Comptroller of Patents and Mr. Justice Parker, to whom appeals under the revocation clause of the Patents Act have so far been referred. Under the clause, it is open to anyone, whether a rival manufacturer of the patented article, an interested user of it, or a "common informer," to apply for the revocation of a patent on the ground that it is worked mainly or exclusively outside the United Kingdom. Unless the patentee proves that the patent is worked to an adequate extent in this country, or gives satisfactory reasons for this having been neglected, the patent will be revoked. The point in question is that the Comptroller thinks that, in ordinary cases, one hearing only is necessary; that is to say, before he considers whether the petitioner's allegations are correct, he asks for the patentee's reply. This is submitted to the petitioner for him to put in the counter-allegations if he so desire, and, in fact, the whole of the patentee's evi-

Digitized by Google

dence is disclosed to the petitioner. It has been pointed out that this inflicts a hardship upon the patentee, who may be forced to disclose valuable information as to the extent of his business to a trade competitor whose application may ultimately be found to be quite unreasonable. Mr. Justice Parker upholds this view, and in accordance with his reading of the Act, petitioner should prove that he has a *primâ facie* case before the patentee is called upon to reply. There is no doubt, therefore, that the Patent Office rules with regard to applications under this clause will have to be revised, and the alteration in procedure suggested by Mr. Justice Parker is that the Comptroller alone should be acquainted in the first instance with the information which the patentee has to give to defend his position, whereupon he will presumably hold a preliminary inquiry. We think, however, that a still more drastic change in the procedure will become necessary, once this point is conceded. Even if the petitioner has a *primâ facie* case, and the patentee is unable to show that manufacture has been carried on in the United Kingdom to an adequate extent, he may yet be able to give thoroughly satisfactory reasons for not having been able to start manufacture. To do so, however, might involve a disclosure of the details of his agreement with licensees in this country, and possibly also particulars of their endeavours to find an extended market for the product in question; in fact, the information so given to his adversary might in the end be far more valuable to him than would be an actual revocation of the patent. There is one moral to be drawn from all this. Owners of patents for metal filament lamps will be well advised to proceed with the utmost celerity with their arrangements for manufacture in this country. If, for instance, application were made for revocation of the fundamental patents for the tantalum lamp, and it could be shown that there was reason to believe that the number of tantalum lamps made in this country was still but a small percentage of the number imported, there would be a *primâ facie* case for a petitioner for revocation. It would certainly not be agreeable to the owners of the patent, if, for the benefit of a trade competitor, they had to go through the whole history of the establishment of their factory here; to give possibly the causes of delay in its completion, and the reasons which render manufacture difficult, and long training of the operatives essential; and, finally, if questions of finance and administration had helped to postpone the completion of the British works, to detail these for their publication in the Comptroller's report, and their subsequent discussion in public on the appeal to the High Court, which would inevitably follow, whether the Comptroller's decision were in favour of the petitioner or the patentee.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 1ST.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster, London. The adjourned discussion on Mr. J. H. Rider's Paper, "The Electrical System of the London County Council Tramways," will be taken.

FRIDAY, APRIL 2ND.

Royal Institution.

9 p.m. Evening discourse by Prof. Sir J. J. Thomson, F.R.S., on "Electrical Striations."

MONDAY, APRIL 5TH.

P. and O. Batti-Wallahs Society.

7.30 p.m. Informal meeting at the Holborn Restaurant, London.

Royal Society of Arts.

8 p.m. Cantor Lecture III., by Mr. G. G. Stoney, on "Steam Turbines."

WEDNESDAY, APRIL 7TH.

Institution of Electrical Engineers, Birmingham Section.

7.30 p.m. Meeting at the University.

THURSDAY, APRIL 8TH.

Mining Institute of Scotland.

6 p.m. Annual general meeting at 32 Cadzow Street, Hamilton, N.B.

Institution of Electrical Engineers: Dublin Section.

8 p.m. Meeting at the Royal College of Science.

OBITUARY

William P. J. Fawcus.

We regret to announce the death of Mr. W. P. J. Fawcus, which took place in London on Sunday last. In recent years, Mr. Fawcus has been prominently identified with the financial side of the electrical industry, but some time ago he left England and settled down in British East Africa, where he devoted his attention to agricultural and engineering enterprises. Last Christmas he returned home to undergo an operation, from which he recovered, but before he had fully regained his strength he fell a victim to influenza, and subsequently pneumonia, from which, unfortunately, he did not recover.

Mr. Fawcus, who was born in 1863, received his early training with a number of prominent engineering firms. In 1889 he was selected for the post of manager of the Manchester Edison-Swan Co., and twelve months later was appointed managing director. Subsequently he was managing director of the Edison & Swan United Electric Light Co., Ltd., and of Messrs. W. T. Glover & Co., Ltd. He has also been a director of Messrs. Crossley Bros., Ltd. A large number of the older municipal and company power stations were designed by him, and since 1900 Mr. Fawcus's name has been familiar as a promoter of power companies and similar concerns, including the Lancashire Electric Power Co. He was the third president of the Northern Society of Electrical Engineers, which he was largely instrumental in forming, and serving a term as a member of the Council of the Institution of Electrical Engineers.

The following tribute to Mr. Fawcus's memory has been sent us by one of those who were closely associated with him for many years past:—

Mr. Fawcus belonged to a type which is, unfortunately, too rare in these strenuous days of acute competition, when the pressure of professional or business life engrosses almost the whole of men's time and attention. Work was to him not entirely an end in itself, as it is to so many men, but rather the means to an end—that of the wholesome enjoyment of life amid the companionship of his family and friends. He was intolerant of the minutiæ and narrow view points which make up so much of the daily round of a business career, and his invincible good-humour and faith in his fellows brought him the high reward of the affection of all who came in contact with him. He may at times have paid the penalty of disillusion exacted from the man of optimistic temperament, whose creed is that "all's right with the world," but he was amply compensated, not only by his own uniformly cheerful outlook upon life, but by his unconscious power of infusing it among those around him. A marked characteristic, which will be remembered gratefully by many, was the disinterested trouble he would take to assist others in their career or in difficulties of any kind, either by counsel or by exerting his influence on their behalf. All who knew him were his friends, for of enemies he had none, and they are the poorer to-day for his loss.

Institution of Electrical Engineers.—The following is the result of the ballot for new members, at the meeting on Thursday:—*Member:* D. A. Starr. *Associate members:* G. Dania, G. M. Maddock, G. E. Marley, N. D. B. Phillips, A. H. Smyth, F. H. Wardle, A. C. Wright. *Students:* G. J. Baldock, H. P. Clinch, P. J. Cottle, R. D. Fairclough, W. H. Grint, B. H. Leeson, A. H. Ogden, H. P. Pentelow, E. A. Richards.

MESSRS. WILLANS AND ROBINSON

THE report and accounts for the half-year ended December 31st, 1908, state that as regards Rugby, after writing off £9,624 15s. as depreciation, there is a profit of £14,045. As regards Queen's Ferry, there is a net loss in respect of the trading operations preparatory to closing the works, and in completing contracts, of £825. This figure covers proportionate contributions to debenture interest and directors' salaries. The net profit for the half-year is £13,220, and the total amount available for distribution or otherwise, including the sum brought forward from last half-year, is £21,266. The directors propose to pay a dividend at the rate of 6 per cent. per annum upon the preference shares, and to apply £1,750 partly in paying interest upon and partly in redeeming funding certificates, in accordance with the approved scheme. In view of the unfavourable prospects of business, the directors do not feel justified in recommending the payment of a dividend upon the ordinary shares. They recommend instead, that the balance of the half-year's profit (£1,470) be added to the amount carried forward.

The business outlook, which at the time of the last report was extremely unfavourable, has undergone no improvement. The continued restriction of enterprise in this country has checked the demand for the company's manufactures, and at the same time has enhanced competition among makers, and has reduced the margin of profit. Owing to improved organisation and methods of work, the company's output for the half-year has been greater than for some years past, but orders are not coming forward so freely as before to replace those completed. Although every effort is being made both to effect economies and to develop the business upon new lines, it has recently become necessary to run the works upon reduced time, though it is hoped that this may be required only for a short period. It may reasonably be anticipated that the causes at present adversely affecting the company's business are not of a permanent character, and that the prospects of an early recovery of prosperity, which until recently appeared very bright, are only postponed for a short period. The directors have not yet succeeded in disposing of the lease and premises at Queen's Ferry, but the surplus plant, other than that which it was expedient to retain for sale with the buildings, has been sold by auction at prices which compare favourably with the auctioneers' valuation.

The directors record, with great regret, the death, in November last, of Lieutenant-General Sir Richard H. Sankey, K.C.B., R.E., one of the two trustees for the debenture stockholders. The directors have appointed Mr. Mark H. Laskey to fill the vacant position, and the debenture stockholders have been invited to approve the appointment. The directors unanimously recommend the election of Mr. Leslie S. Robertson as an additional ordinary director. It is proposed to fix his remuneration, as an ordinary director, at £400 per annum. It is considered that this is the least sum for which gentlemen of standing and experience can be expected to give their services. The meeting is on April 6th.

Accompanying the report is a circular letter which states that Mr. Mark Robinson, the chairman, has been obliged to place his resignation in the hands of the Board owing to ill-health. Mr. Robinson has still two years to serve as chairman, and having regard to his past services to the company, the directors will propose at the annual meeting that an allowance of one year's salary, viz., £2,653, be made to Mrs. Robinson, or trustees on her behalf. Mr. Robinson's doctor has advised that his only chance of recovery is in permanent relief from his duties.

Electrification of the Victorian Railways.—With reference to Mr. C. H. Merz's report upon the electrification of the Victorian suburban railways, and the subsequent adverse report of the Railway Commissioners (see ELECTRICAL ENGINEERING, Vol. IV., pp. 456 and 848), *The Australian Mining Journal* states that Mr. Merz's confidence in his estimate and scheme is not shaken by this latter report. It will be remembered that in his report Mr. Merz recommended electrification in the belief that the change would lead to an increase in traffic, and would, within a reasonable time, show a fair margin of profit. On both these points the Commissioners joined issue with him, and advised that the scheme be not adopted, as it appeared to them to involve a considerable annual loss. Mr. Merz has replied to the report of the Commissioners, and is stated to maintain his former position, without any abatement.

Telegraph Traffic.—The *viâ* Hanekine route was interrupted between Alip and Bagdad, and between Mossoul and Bagdad on the 26th ult., but repairs were effected on the 28th ult. The Compagnie Française des Cables Télégraphiques has been engaged in repairs of its southern sections, providing communication with the Guianas and Brazil, and it was successful in repairing the cable between Cayenne and Salinas on the 29th ult. The cable between Paramaribo and Martinique still awaits attention, having been broken since February 18th. On the 28th ult. the same company's cable between Martinique and Guadeloupe ceased operations. The Tourane-Amoy cable route has been interrupted since January 19th last. Apparently a settlement of the Venezuelan telegraphic imbroglio has not yet been arrived at, and, if the report be true that President Castro will return to Venezuela, little hope of a speedy settlement of this long outstanding question may be entertained.

PARLIAMENTARY INTELLIGENCE

SURFACE-CONTACT SYSTEMS.—In the House of Commons last week, Captain Faber, who is interesting himself in the proposal of the National Electric Construction Co. to abandon the use of a surface-contact system on the Folkestone, Sandgate, and Hythe tramways, asked the President of the Board of Trade why the Dolter surface-contact system had been abandoned between Mexboro' and Swinton. Mr. Tennant, who replied on behalf of Mr. Winston Churchill, stated that although frequent complaints were made to the Board of Trade of the occurrences of live studs on this particular system, the company running it decided, on its own initiative, to replace it by the overhead system.

LONDON COUNTY COUNCIL TRAMWAYS AND IMPROVEMENTS BILL.—Notice is given of an intention to apply for the insertion of an additional provision in this Bill, authorising the London County Council and the Metropolitan Electric Tramways, Ltd., to carry into effect the agreement recently come to with regard to the Harrow Road and Paddington tramways. (See ELECTRICAL ENGINEERING, Feb. 25th.)

PROGRESS OF ELECTRICAL BILLS.—This Board of Trade Bill, which constitutes the London County Council the purchasing authority of the West End electric lighting companies, has been allowed to proceed by the Standing Orders Committee. The Examiners for proofs of compliance had referred the Bill to the Committee on account of the statutory notice being late.

The Baker Street & Waterloo Railway Bill was read a second time in the House of Commons on Wednesday last week.

The Edgware & Hampstead Railway Bill and the Holywood Tramways Bill were read a second time in the House of Commons on Monday.

NORTH-WEST LONDON RAILWAY.—The Court of Referees on Tuesday granted the Great Western Railway Co. a *locus* against Clause 5 of the North-West London Railway Bill, which proposes the construction of a loop line from the authorised Edgware Road station, joining up with the Baker Street and Waterloo Railway.

TORQUAY & PAIGNTON TRAMWAYS.—This Bill came before the Standing Orders Committee of the House of Commons last week, and was allowed to proceed subject to Tramway No. 2 being deleted. This tramway, which is in the district of Paignton Council, has been rejected owing to the promoters failing to obtain the consent of the Council.

CENTRAL LONDON RAILWAY.—The second reading of the Central London Railway Bill, which was down for Thursday last, has been postponed until this evening.

WALLASEY TRAMWAYS & IMPROVEMENTS BILL.—This Bill was before a Committee of the House of Commons, presided over by Mr. Russell Rea, last week. The Bill provided among other things for tramway extensions to Wallasey Village at a total estimated cost of £10,627, and to this there was no opposition.

COUNTY OF DURHAM ELECTRIC SUPPLY BILL.—A Committee of the House of Lords, presided over by Lord Newton, considered this Bill on Friday, and ordered it to be reported for third reading. The Bill empowers the Newcastle-upon-Tyne Electric Supply Co., the County of Durham Electric Power Supply Co., and the Cleveland & Durham Electric Power Co. to combine and link up their works under a scheme of co-operation. Originally there had been many petitions deposited against the Bill, but most of the opponents had been settled with before the Committee stage, and it only remained for a few minor clause adjustments to be made. Mr. Vesey Knox K.C., who appeared for the company with Mr. Lynden Macassey, said that the three companies named supplied a quantity of electrical energy equivalent to 25 per cent. of the total sold in the whole of the United Kingdom, whilst upon Tyneside they supplied 95 per cent. of all the power used.

The Högner Flame Arc Lamp Patent.—On March 16th, an appeal against the decision of the Comptroller General of Patents to revoke patent No. 23,606 of 1902, under section 27 of the new Patents Act, in accordance with the petition of Mr. G. Braulik, was lodged by the owners of the patent, Messrs. Körting and Mathieson. The decision of the Comptroller was published in the last week in February, and an abstract of the text of the decision was given in ELECTRICAL ENGINEERING, February 25th, page 178. The patent was taken out by Mr. Paul Högner, Chief Engineer of the German firm of Körting & Mathieson, whose agents in this country are the Union Electric Co., Ltd.

The Airship Explosion at the Franco-British Exhibition.—In the Marylebone County Court a short while ago the widow of the man who was killed in the airship explosion at the Franco-British Exhibition in August last, was awarded £300 compensation under the Workmen's Compensation Act against the Franco-British Exhibition Co. A full account of the accident was given in ELECTRICAL ENGINEERING, Vol. IV., p. 381. The Appeal Court, however, have held that as the man who was killed was employed by a Captain Lovelace, the owner of the airship who was exhibiting it, and not by the Franco-British Co., the widow's remedy was against him and not against the company. The appeal was, therefore, allowed.

THE ELECTRICAL SYSTEM OF THE L.C.C. TRAMWAYS

A PAPER by Mr. J. H. Rider (Chief Electrical Engineer to the London County Council) was read last Thursday before the Institution of Electrical Engineers. In the absence of Mr. Rider through temporary illness, the Paper was read by Mr. J. Shepherd. After giving some historical notes on the taking over and equipment of the lines and the temporary arrangements made from time to time for the power supply before a permanent generating station was established, the author proceeded to a detailed description of the power house at Greenwich. This power house, by the way, is situated on the Thames exactly on the meridian of Greenwich, a fact which led to some difficulties with the Greenwich Observatory, in consequence of which one of the four chimneys has not been carried up to the full height of the others. The total length of the London County Council tramways at the end of March last year was 120⅜ miles, of which 68⅝ miles were electrically equipped.

A prominent feature of the station is the coaling arrangements, in connection with which a special pier was constructed, projecting into the Thames for a distance of about 118 ft. in front of the river wall. Electric jib cranes remove the coal from the barges, and electric locomotives, supplied from a third rail at 550 volts, haul the coal trucks to the outside bunker house. Interesting details were given in the Paper of the methods of sampling and testing the coal, and the way in which the price paid to the contractor is determined by the results of the tests.

From the outside bunkers an extensive series of electrically-driven bucket conveyors take the coal to the bunkers over the boiler house, from which the furnaces are fed. An interesting point in the construction of the conveyors is the care that has been taken to prevent damage to the conveyors in the event of the chains breaking.

The driving gear is fixed at the top of the first vertical rise in the boiler house, and, to prevent the conveyor from running backwards when the motor stops, owing to the excess weight of the coal in the vertical limb, a pawl is arranged to engage between the links of the conveyor chains. This pawl would also prevent the chain from falling should the chain break from any cause. At the south end of the boiler house, where the conveyor chains descend empty, two continuous vertical runners have been fixed the whole height of the building, and, should the chain break, it can only fall for a distance of a few inches, as it would quickly jam in the runners, as will be seen by Fig. 1. It should also be noticed that, in case of accident, the conveyors can be stopped from a number of convenient points by means of push-buttons.

The Paper then goes on to give particulars of the boilers, of which the first 24 were of the Stirling pattern, and the second 24 of the Babcock and Wilcox pattern. Twelve of the latter are still in course of erection. The good results of the furnaces as regards smokelessness are attributed by Mr. Rider largely to the excellent combustion chamber provided by the Stirling boiler, by the fact that the Babcock boilers are raised some 12 in. higher than is usual above the fire-bars, and the use of a large fire-brick arch immediately over the grate. There is a popular belief at the station, however, that the smokelessness of the chimneys is accounted for by the notice, "Smoking strictly prohibited," which is prominently fixed in the boiler house on the base of one of the chimneys.

Make-up feed water is taken from an artesian well, the water from which is softened with lime water and carbonate of soda in Harris-Anderson softeners. Purifiers made by the same firm are used to remove the oil from the water coming from the condensers of the reciprocating engine; the chemicals used in this case are sulphate of alumina and carbonate of soda.

The steam-pipe system was designed so that the line of the pipes should fall the whole way from the boiler stop valve to the engine separator (so that all water would travel in the same direction as the steam), and the principle has also been followed that the expansions and contractions due to changes of temperature should be controlled by provision of facilities for the movements of the pipes in certain directions and restrictions of the movements in others.

An interesting feature of the steam-pipe system is the design of the separators. These are merely steel vessels, in which the direction of the steam flow is suddenly changed, and they rest upon a series of steel balls, which are carried upon spring-borne supports in cast-iron stands bolted to the floor of the engine-room. The separators can thus move in any direction, either sideways by rolling on the balls, or up or down by relieving or compressing the springs. A drawing of the lay-out of the pipes, and an illustration of the movable separator, appeared in an article by Mr. Rider in Electrical Engineering, of December 19th, 1907 (Vol. II., p. 973).

The engine-room contains at present four vertical-horizontal reciprocating engines, coupled to alternators of 3,500-kw. capacity, at a power factor of 0·94, and two turbo-alternators, each of 5,000-kw. capacity at a power factor of 0·85. Two additional turbo-alternators of the same output are also in course of erection. The general design of the original reciprocating engines, with their vertical high-pressure cylinders and horizontal low-pressure cylinders, is now well known. A special advantage of this arrangement over the use of a horizontal high-pressure cylinder and a vertical low-pressure cylinder, as usually employed with this class of engine in America, is that a perfectly natural system of drainage is obtained, and the large water pocket formed by the receiver pipe is avoided.

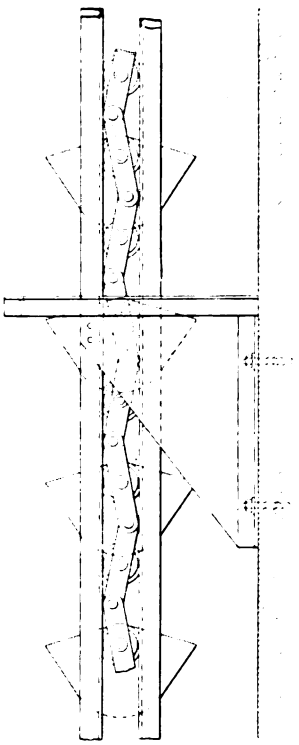

Fig. 1.—Conveyor Safety Device.

These engines were built by Messrs. J. Musgrave & Sons, Ltd., and run at 94 r.p.m.; the alternators are mounted on the shafts between the pairs of cylinders, and have sufficient fly-wheel effect in their rotors to keep the angular variation of velocity within 0·15 per cent. up or down. The generators were built by the Electric Construction Co., and are of the revolving field type, with 32 poles. They deliver three-phase currents at 6,600 volts between phases, and 25 complete cycles per second. The special features of their design include the shaping of the pole pieces to taper off the field suitably and the provision of dampers.

Tests of one of these sets have given steam consumption of 16·88 lbs. per kw.-hour at full load, and 16·67 lbs. per kw.-hour at half load. These tests were taken with a vacuum of 26·74 and 26·8 in. respectively, and steam temperatures of 460 and 446° F. respectively. The only alteration that has been made in these engines is the substitution of phosphor-bronze piston rings for those of cast iron. Each machine has its own rope-driven exciter.

The four turbo-alternators are each of 5,000-kw. normal output, and 6,250-kw. output on overload. They run at 750 revs. per minute. The two at work were built by Messrs. Willans & Robinson, Ltd., and Messrs. Dick, Kerr & Co., Ltd., and are of the reaction (Parsons) type, while the two now being erected are built by the British Westinghouse Co., Ltd., and are of the impulse (Rateau) type. The Willans turbines are of the standard pattern made by that firm, with 98 rows of blades in 11 stages on both rotor and stator. The generators are also of the standard construction of Messrs. Dick, Kerr & Co., Ltd. The fields are of the revolving type with salient poles. The stators have six slots and eighteen conductors per pole per phase. The exciter is carried on an extension of the generator shaft, and is of 37·5-kw. capacity. Each Willans turbine has one surface condenser in the basement, with a vacuum augmentor. The guaranteed steam consumption is 15 lbs. per kw.-hour on full load, with steam at 550° F. and a 95 per cent. vacuum, but this figure has not yet been verified. No bonus is

Digitized by Google

offered for better results, but a penalty will be incurred if the results are worse.

In the author's opinion a number of the blade-stripping troubles which have been experienced with reaction turbines in the past have been largely due to striving after low steam consumptions. What should be really desired, he says, is perfect immunity from blade troubles under all possible conditions of working, as the financial result of a shut-down of a big set is not to be measured by the cost of the repair so much as by the loss due to the disorganisation of traffic or the failure of the supply. A reputation for absolute continuity of supply is worth a great many pounds of coal per annum.

No particulars are given in the Paper of the new Rateau sets The engine-room plant is completed by a pair of 150-kw. continuous-current sets for station lighting and auxiliary purposes.

The switchgear at the Greenwich station was described in a Paper by Mr. F. Walker, read before the Glasgow local section of the Institution of Electrical Engineers in February, 1907 (published in an abbreviated form in ELECTRICAL ENGINEERING, Vol. I., page 390). It is of the electrically operated remote-control type, arranged in two galleries, and was supplied by the British Westinghouse Co. Provision is made for eight generators and 32 feeder circuits in eight sections. Each section of four feeders has its own bus-bars, which are normally connected to a generator independently of the main bus-bars.

The switchgear is arranged in two galleries. The lower gallery contains the control desks, the instrument boards, the generator and feeder isolating plugs, and the instrument transformers. The upper gallery contains the oil switches and their isolating plugs, the main bus-bars, and the spark gaps. A simple system of illuminated signals gives instructions from the switch gallery to the engine drivers, and there is also an electrically actuated governor adjustment to the generating sets operated from the gallery.

Reverse-current relays are fitted on the generator circuits and time-limit overload relays on the feeder circuits. Experience with the reverse relays has almost converted the author to the opinion that the generators should have no tripping relays of any kind whatever. All the spark gaps are connected to a common earthing system, and until recently the central points of the star windings of the stators of the generators were also directly connected to this earthing system. The experience at Greenwich, however, has been similar to that at other places, viz., that when more than one machine is running, heavy local currents are set up between the various machines through this earthing connection, the currents having a frequency equal to three times the normal. It was also found that, when an earth connection took place at any part of the external high-pressure system, the heavy resulting current brought the voltage of the whole station down, pending the opening of the time-limit circuit

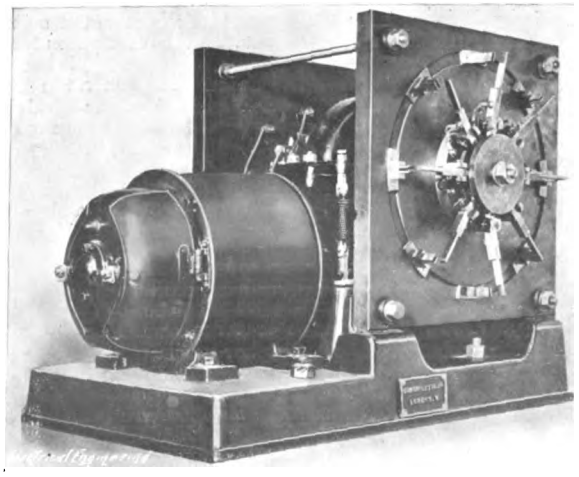

FIG. 2.—AUTOMATIC EARTHING SWITCH.

breaker. It was therefore decided that a resistance should be used to limit the earth current, but as the long feeders have an appreciable resistance, the earthing resistance had to be very low to make the action of the circuit breaker certain if the fault occurred at the end of the longest feeder. It was finally decided to connect the neutral of only one machine to the earthing resistance, and an automatic switch designed by Mr. E. V. Shaw was adopted, by which, if any machine which has its central point connected to earth is shut down, another machine is immediately connected.

The apparatus is shown in Fig. 2, and Fig. 3 gives a diagram of its connections. It consists of two independent sets of circular switches, upon two panels at opposite ends of a shaft, operated by a motor. The switches on one panel are of the single-pole knife type, and are eight in number, arranged in a circle. They are operated by a cam on the end of the worm-wheel shaft, and control the working of the motor. The switch on the other end is of the flat spring contact type, and makes connection between two sets of contacts arranged in concentric circles. This switch controls the closing solenoids of the earthing switches of the eight generators. The cam which operates the motor switches is so arranged that, as the shaft revolves, one switch after the other is closed. Only one switch remains fully

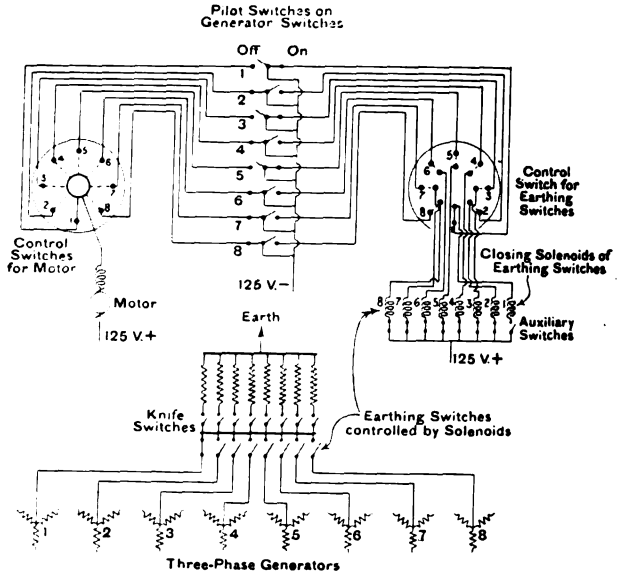

FIG. 3.—DIAGRAM OF CONNECTIONS OF AUTOMATIC EARTHING SWITCH.

closed at any one time, but the following switch does not open until the one in advance is fully closed. As the motor revolves, therefore, it closes these knife switches one after the other, and so maintains its connection with the source of supply, provided that the other parts of the circuit are complete.

Each of the generator and feeder main oil switches is fitted with a small double-throw pilot switch, which is operated by the motion of the main switch, and is used to connect either a red or green signal lamp. The red lamp lights up when the main switch is closed and the green lamp when it is opened. These pilot switches have been utilised to act as the key switches for the control of the motor.

The earthing resistance is made up of a number of frames of grids, and has a total resistance of about 3·5 ohms.

After some notes on the accumulator battery for auxiliary purposes, the condenser water-supply arrangements were dealt with in the Paper There is a separate centrifugal pump house which is divided into three portions, that nearest the river containing three fixed strainer boxes, the middle portion containing the centrifugal pumps and the rotary strainers, and the inner portion the valves controlling the various lines of pipes before they enter the engine-room. The use of Thames water for condensing purposes has frequently given a great deal of trouble in consequence of the large amount of mud which is held in suspension, and the quantities of straw, hair, and other foreign matter floating in it. The arrangement at Greenwich, which was designed on the advice of Messrs. Bailey & Jackson, of the City of London Electric Lighting Co., has proved most effective, and the author wishes to place on record his obligations to them in this respect.

The rotary strainers, which were constructed for the Council by Messrs. Bailey & Jackson, will deal with about 1,000,000 gallons of water each per hour. The apparatus consists of a circular casing some 10 ft. in diameter, and about 5 ft. wide. In the centre of the casing, and capable of very slow revolution, is a wheel, containing, between its spokes, grids formed of sheet brass strips, interlaced or corrugated in a particular manner so as to form small channels for the passage of water, these channels being about $\frac{5}{16}$ in. in diameter. On either side of the wheel the casing forms a chamber, each of these chambers being divided by a partition of considerable width into two compartments. The first receives the unstrained river water, which, after passing through the strainer wheel, reaches the compartment immediately opposite, and passes thence into the main circulating pipes to the condensers.

The water on its return is led into the fellow compartment on the same side of the casing, and, after passing through the strainer wheel in the opposite direction, reaches the compartment immediately opposite, whence, together with the solid matter previously separated out and temporarily retained upon the strainer surface, it is returned to the river. The wheel is rotated very slowly by means of a circular rack, about one

Digitized by Google

revolution in two minutes being sufficient for ordinary conditions of Thames water. The rack is driven through worm-gearing by a small three-phase motor.

To provide against the wheel becoming choked or jammed by foreign substances getting between the rim of the wheel and the casing, a special form of packing is provided, and sealed with water at a slightly greater pressure than the circulating water. As by the arrangement described, the circulating pipe system is completely sealed, full advantage of syphon action and consequent saving of power for pumping is obtained, and also all fibrous refuse is automatically rejected and returned to the river. The only disadvantage is that a certain amount of water, amounting to about 15 per cent., leaks past the partition, and is returned to the river without flowing through the condensers.

The effect of reversing the flow of the water in the fixed strainers and suction pipes has been very successful, and, on a recent occasion, when one of the pipes in the strainer house was opened up in order to couple up one of the new river pipes, hardly any mud or deposit was found, while no trouble has been experienced in the condenser tubes, showing that the rotary strainers effectively prevent all foreign matter from passing into the pipe system. The valves in the fixed strainer and valve houses are arranged around the edge of a gallery, and are operated by means of a small portable electric motor and wormgear.

To relieve the condenser-pipe system of any air which might accumulate, two 6-in. barometric syphon pipes are arranged, which extend about 40 ft. vertically, and are connected at the bottom to the highest points of the pipe system. Two dry air pumps take the air from the top of the barometric pipes.

A large cast-iron sump, about 8 ft. in diameter and 15 ft. deep, has been sunk in one corner of the centrifugal pump house, and into this sump all the drainage water of the station is led. The basement of the station is below the level of the street sewer, so that a direct connection to the sewer could not be obtained. The sump is regularly emptied by means of a small electrically-driven centrifugal pump.

The boiler blow-down pipes were originally connected to a sump also, but the enormous quantity of steam which was given off when the boilers were blown down was so objectionable that a new arrangement has recently been devised, which works exceedingly well. It is customary to blow down each of the working boilers every night to an amount of about 5 in. in the gauge-glass in order to keep down the alkalinity of the water. The method now adopted is as follows :—A large wrought-iron tank has been fixed in the yard, with a 12-in. pipe at the top connected to the vertical atmospheric exhaust pipe. The boiler blow-down pipes are coupled up to this tank, and all steam which is given off passes harmlessly away through the atmospheric pipe. The tank discharges by gravity into the river through the condenser water discharge system, and air leakage is prevented by means of a syphon, which is placed within the sump mentioned above. There is always enough water left in this syphon pipe to seal the condenser pipe system effectively.

The whole of the river pipe-work beyond the strainer house was carried out under the supervision of Mr. Fitzmaurice.

The Paper next went into figures of capital and operating costs, giving the total capital cost of the station, as far as completed, as £803,470, or £23·63 per kw. The working expenses are given as follows :—

	£	PER UNIT. d.
Coal (including unloading) and removal of ashes	64,797	0·2327
Salaries and wages, running staff	9,840	0·0353
Oil, waste, water, and stores	2,164	0·0078
Repairs to plant, and buildings (labour and materials)	5,014	0·0180
Management, insurance, and miscellaneous	1,697	0·0061
Rent, rates and taxes	8,696	0·0312
Total	92,208	0·3311

These figures are for 1908, and refer to the first half of the station only.

The latter part of the Paper deals with the transmission and distribution systems. There are 13 sub-stations, to each of which run one or more three-core 0·15 sq. in. cables, and the sub-stations are connected together by 0·075 sq. in. inter-connectors. The motor generators are by various makers, and aggregate 50,000 kw., varying in size from 300 kw. to 1,500 kw. Some are of the synchronous and some of the induction type. Some trouble was experienced at first with the breakdown of stator coils at the time of switching on to the bus-bars. The breakdowns usually took place between adjacent turns of the terminal coils, and frequently resulted in earthing that particular phase on account of the destruction of the whole of the local insulation. With the exception of machines of one make the fault was common, and was originally believed to occur in consequence of some momentary abnormal rise of bus-bar pressure when the machine was switched on. Careful investigation with an oscillograph, however, showed no such rise, but rather a slight fall of pressure, which is what would have been expected considering the sudden and momentary heavy rush of current.

Investigations by others, however, seemed to indicate that the terminal coils of the machines, which, under ordinary circumstances, would only have to deal with their own comparatively low voltage, were subjected, at the times of switching on, to the full potential difference of the bus-bars, in consequence of the fact that it took a certain time for the voltage, as it were, to soak in. It also appeared that the terminal coils would be subjected to similar abnormal strains in the event of a bad earth on either of the feeders, which might have the effect of suddenly lowering the potential at one terminal of the machine down to zero.

Extra insulation was therefore placed between the respective turns of the terminal coils, and this had a marked effect in reducing the trouble. It was, however, not entirely cured, and the fact that the machines of one particular make did not suffer in this way, although the coils were hand wound, led to the conclusion that the proportions of the coils, and the manner in which they were constructed, had a good deal to do with the trouble.

With the exception of the coils of the machines just mentioned, the whole of the windings of the induction motor-generators consisted of open-ended former wound coils, made up and insulated in the correct shape before threading through the partially closed slots of the stator. The ends were afterwards joined together so as to form a complete coil.

Coils with five different arrangements of the conductors were in use, and these are indicated in Fig 4. It will be seen that,

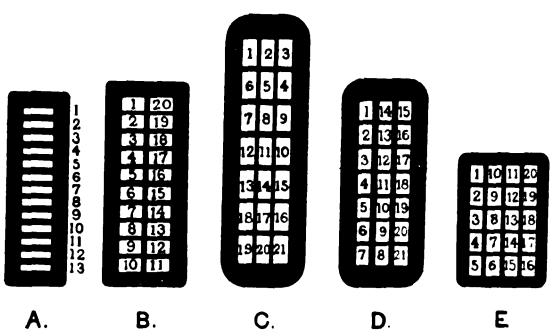

Fig. 4.—Arrangements of Conductors in Stator Coils of Motor-Generators by Five Different Firms. (Half Size.)

with the exception of the coils of type A, there was a considerable difference of potential between certain of the adjacent turns, which difference could become seriously aggravated when switching-in took place. It seemed evident, therefore, that the type of coil indicated at A was much superior to the others, and this type has been rigidly specified in all recent machines. That this point had a great deal to do with the breakdowns is evident, when it is stated that there are a number of machines working in the sub-stations with coils of type A, which are tunnel wound by hand, without any special impregnating or insulating material between the layers, and that they have not broken down since they were started, several years ago. Machines with coils having the conductors arranged as at B, C, D, and E in Fig. 4 have frequently failed, although they have been semi-former wound, and special care was taken as regards the insulation between the various turns.

The following standard specification is now enforced for all motor-generator coils, whether of the induction or of the synchronous type :—

"The stator windings to consist of one coil of only one turn wide per layer, per slot, and to be made into partially formed coils before inserting in the slots. The straight portions of each coil to be thoroughly insulated, both externally and between layers, with mica, and the whole of the coil to be thoroughly impregnated under vacuum and pressed to shape while hot.

"The straight portions of the coils to be an exact fit for the width of the slots after the coils have been hot pressed, and to be evenly threaded through the partially closed slots of the stator. Any space remaining radially to be closed up by accurately fitting wedges driven right through the slot at the periphery.

"When in place the open ends of the coils to be joined up and well insulated. The external loops of the windings to be well taped and varnished, and to be finished all over with an oil and waterproof varnish. If the coils are not stiff enough to stand the mechanical strains which might occur in working, the external loops to be securely anchored in mechanical supports on each side of the core."

E

Digitized by Google

Attempts were made by means of an oscillograph to ascertain whether the terminal coils of the machine were actually subjected to the full voltage of the bus-bars at the instant of switching on, but only a small rise was observed, which would not account for the frequent breakdowns, and it was evident that the dangerous rises, if they exist at all, only last for such a short instant of time that, even on an oscillograph having a natural frequency of $\frac{1}{5000}$ of a second, no indication was observed.

A series of experiments were then carried out to ascertain whether any benefit would be derived by switching on the induction machines through choking coils which were afterwards short-circuited. This was found materially to reduce the apparent shock of switching the machine on, so far as could be judged by the noise made by the machine. The best proportion of choking coil was obtained when the coil absorbed about one-half of the voltage across the bus-bars. The oscillograph, however, recorded a voltage rise as high when the choking coil was short-circuited as when the machine was switched on without the choking coil. A number of such choking coils and short-circuiting switches have since been fixed in some of the sub-stations, and they appear to have had very beneficial results.

The H.T. switchgear in the sub-stations is compactly arranged in some cases in the basement below the operating floor, and in some cases in galleries. The arrangement of the L.T. switchgear has some features differing from those of a sub-station for a system with an earth return. The principal distinctive point is the possession of change-over track feeder switches, by which the polarity of a section of the track can be reversed at any time. This is in view of the fact that positive and negative faults may occur simultaneously on two different sections fed from the same sub-station. These, of course, would constitute a short circuit so far as the sub-station is concerned, and means have to be provided by which the positive fault can be changed at once into a negative fault. This is done by reversing the polarity of the track feeders of the section having the positive earth.

These special switches are fitted with auxiliary contacts, whereby the track feeders can be connected through a resistance of 5 ohms to the bus-bars and to a special testing panel. The negative bus-bar of the sub-station is connected to earth by means of an adjustable water resistance. After describing in some detail the methods by which faults of every nature are dealt with, the Paper concludes with a few notes on the arrangement of the feeder pillars, and a few figures showing the increase in the size of the undertaking since its inception.

DISCUSSION.

Mr. Frank Bailey (Chief Electrical Engineer, City of London Electric Lighting Co.) said that from what he had seen of the running of the Musgrave engines at Greenwich, he thought the people who had told Mr. Rider that his station was already out-of-date had been very ill-advised; everything pointed to the Musgrave engines running a long time after the turbines had had two or three changes. With regard to the general design of the works, he thought that the outstanding feature was their colossal magnitude and the open-mindedness with which they were being operated. It was true that in putting down the scheme the officers of the London County Council had the encouragement of the ratepayers of London behind them, but nobody could suggest that they took any unfair advantage of this. The works were of national importance, and a credit to the nation. The design of the iron-work in the engine-room formed a study for all engineers. Year after year we in England had been criticised by our Continental friends for the ungainly and unsightly manner in which our buildings had been put up, but these people had not seen the Greenwich roof. It was an artistic piece of work, and worthy of the importance of the undertaking. Mr. Bailey then spoke on the feed and circulating water arrangements. He thought that it was a pity to use so much soda for the water purification, because later on in the Paper mention was made of the necessity for blowing off five inches in the gauge glass on each working boiler every day, in order to keep down the alkalinity of the water. In his opinion this blowing off would not be necessary if it were not for the use of so much soda. This blowing off was from the blow-off cock, and not by the use of the scum cock: it was a different matter altogether, and whilst he appreciated the desire to avoid water becoming too salt, yet it seemed a pity that something like barium aluminate could not be used to avoid excessive waste. That it was waste could easily be shown by consideration of the fact that five inches of the ordinary gauge glass would mean something like 360 gallons of water, and at 380°F. the heat units contained in this would be 1.000.000. Assuming coal at 14s. per ton, with a calorific value of 12,000 B.Th.U. per lb., and a boiler efficiency of 70 per cent., so that 8.400 B.Th.U. was obtained per lb. of coal, it actually cost about £530 per annum to reduce this amount of salt in the water. It was of course necessary to keep salt down. He had been experimenting in this direction, and had found that the electrical resistance of water in a boiler with a comparatively small percentage of salt, was a very vital matter indeed. The electrolytic action was considerable, and the effect could be seen upon the plates, in addition to the deleterious action on all the fittings of the boiler. With reference to Mr. Rider's appreciation of the work of Mr. Jackson and himself (Mr. Bailey) in connection with the circulating water supply, he said that there were several features in connection with this work which Mr. Jackson and himself had had before them for years at Bankside. In addition to the problem of avoiding pumping up tons and tons of stray fibre and other matter, which simply blocked up the whole of the condenser tubes, pipes, &c., the next difficulty was to keep air out of the pipes, and not only air but marsh gas and other compounds of that sort. These rotary strainers, he was glad to say, had worked quite satisfactorily. With a fixed grid it was found that in a few hours the whole thing was plastered up solid. Then the pressure on the pumps was increased in order to get the water, and sooner or later the whole grid collapsed, and they got the accumulation of several hours into their pipes and tubes, and it was a week's work to clear the place out. At Bankside there had been, on occasions, £50.000 or £60,000 worth of condensing plant practically on the scrap heap, because they could not get the water through. Another advantage of the rotary wheel was that in dealing with this large quantity of fibrous material it simply returned it to the place it came from. It had been suggested that these things were unduly costly, weighty, and altogether unnecessary for this work. But he could only say that at such places as Greenwich and elsewhere, where enormous quantities of condensing water had to be dealt with, it was absolutely necessary to have something very substantial to do the work. The strainers weighed 25 tons each, and as they had to work against a 30 feet head normally, it showed that there must be considerable strength to stand such pressure. It was true that the pressure was fairly steady, but it was rather excessive at Greenwich, he thought, owing to certain difficulties with the pipes inside. They were a little bit small in one or two places, and therefore 30 feet was necessary, whereas at Bankside 10 feet was enough. At Bankside, also, they did not suffer from any leakage across, whereas at Greenwich there was 15 per cent. But this was a small matter when dealing with such large quantities and when dealing with a large head, although this head was necessitated by conditions which might be overcome by larger pipes or other arrangements. In conclusion, Mr. Bailey said he could only wish that he had a work of this sort to carry out, because not only were there 3¾ acres, of which a good deal was the roof of the engine-room with a turbine underneath—something like a mouse in a house—yet they must not overlook the fact that the revenue of £1.500,000 worked out at £84 per kw. of load, whereas he himself was thankful to get £15 per kw. of load, and Mr. Rider could look forward to better results in the years to come.

Mr. B. N. Jenkin (Messrs. Kennedy & Jenkin) said, with reference to the difficulties with the winding of the motor generators, of the importance of which most manufacturers were aware, he thought that, besides putting on the additional insulation to prevent breakdown, and arranging the windings in order to get the minimum difference of voltage between the turns, they might consider whether it was not worth while to try and prevent the machines being subjected to the great shocks on switching in. Mr. Rider mentioned that he had tried to ascertain the pressure across the end turns by means of the oscillograph, with the result that he did not find any excessive pressure occurring. This rather confirmed some experiments that he made at one time with Mr. Duddell's help, where the oscillograph failed to show any particular rise of pressure, but they got sparking across spark-gaps showing that they certainly did get a big rise of pressure, as much as twice the normal, but which did not appear as more than quite an insignificant rise on the oscillograph. He had used an ordinary Ferranti charging apparatus, and in that way had been able to avoid the excessive pressure at the moment of switching in. When they had signs of water hammer in a steam pipe they did not usually go to the extent of strengthening the steam pipe; they prevented water-hammer by removing the water in time. He would be very glad if Mr. Rider would say something more about the comparative merits of the different types of motor-generators. There were now in use on the County Council system synchronous motor-generators, squirrel-cage induction motor-generators, and rotary convertors. He gathered that Mr. Rider had adopted induction machines chiefly on account of their simplicity, but he did not say anything about their comparative efficiency beyond giving a general figure of 90 per cent. It would also be interesting to know what the general power factor was during the day, as he could not help feeling that with such a large number of induction motors Mr. Rider must be loading up the generating plant with a large amount of useless current. Another point of interest in connection with the sub-stations was the extent to which it was found possible to use the overload capacity of the motor-generators. His firm had found at some of the railway sub-stations that they got momentary overloads of perhaps 30 per cent. on the motor-generators, and even more at times, and if they had plant that would take these momentary overloads satisfactorily, they got a very much better average load on the machines, and very much higher efficiency.

Mr. Martin Roberts (Assistant Engineer-in-Chief, G.P.O.)

Digitized by Google

said that from a recent tour of Continental stations he was convinced that Mr. Rider's station would bear comparison with any of them, but that a great many Continental stations would not bear comparison with Mr. Rider's. One of the features in which the Greenwich power-house could be said to be ahead of Continental practice was the admirable coal-conveying arrangements, although it appeared to him rather dangerous to have a live rail on the pier at 550 volts. The method of preventing the coal conveyor from running backwards, he said, was not novel, as it had been employed twelve years ago at the Mount Pleasant Parcel Office for continuous lifts. With regard to Mr. Bailey's remarks upon the head of water at Greenwich, he did not think this was entirely due to the size of the pipes. He would like Mr. Rider's opinion as to whether the barometric pipe was really of any assistance, and to know how often it was necessary to use it. He disagreed with Mr. Bailey that 15 per cent. of the water passing through the strainer being pumped to waste was a small item on such a large quantity. As it was percentage, he should have thought that, the larger the quantity of water, the more serious would the loss become. He hoped Mr. Rider would give them some information in respect of the relative economy of turbines and reciprocating engines. As Mr. Rider had stated that he regarded absolute reliability of working and absence from complete breakdown of greater importance than very great steam economy, he took it that the 15 lbs. per kw.-hour for the turbines was regarded as a reliable average which should be reached, and, consequently, it would rather appear that the turbines were expected to be more economical than the engines which require 16·88 lbs. of steam per kw.-hour. Possibly, Mr. Rider could say whether he had found that when the turbines were working instead of the reciprocating engines, there was any change in the coal consumption. It was very often heard that turbines gave a better steam economy, but that when the larger quantity of condensing water necessary to get the better vacuum was taken into account, there was really no economy in turbines. If Mr. Rider could give them a little information on this point without waiting for official tests, he was sure they would all be very much obliged to him.

The discussion was then adjourned, and will be resumed this evening.

TRACK BRAKES

By Henry M. Sayers

THE reports on tramway brakes recently issued by the two tramway associations both contain results of tests made with the object of discovering the best material for the blocks or shoes of track brakes. The best material means primarily that which gives the highest and most uniform coefficient of friction with the rails under all the conditions of speed and rail surface which are met with in working. The results published are inconclusive, as the Committee of the Tramways and Light Railways Association acknowledge in discussing the tests with blocks drawn along rails. It was quite evident to those who made the tests that there are more variables involved than could be separated out in the time available. The important object is to obtain blocks which will have a high braking effect upon rails under all the conditions of weather and other influences which affect their surface, and experiments made under artificial conditions can hardly do more than give limiting values. The real difficulty is that the rubbing surfaces are liable to lubrication, or the reverse, by dust and mud of constantly varying composition and consistency, varying not only from minute to minute, but from inch to inch.

As regards track brakes used for control on steep gradients, the main question is whether wooden or iron blocks will give the highest minimum coefficient of friction under all working conditions, because the minimum determines the safety limit. With dry, clean rails, there is no doubt that wooden blocks are superior to iron or steel. The most complete set of tests bearing on this point are those recorded in the T. and L.R.A. report, Appendix I., "A," "B," and "C." The first series was made by applying blocks to a rotating steel-tyred wheel, and gave the curious result of a coefficient rising with increase of speed for the wooden blocks. As no such rise was recorded with tests made on rails, it was probably a secondary temperature effect. The minimum coefficient with wood was about 0·4, both cast and wrought iron blocks gave lower figures, but the results are not safely applicable to track brakes in which the constant presentation of fresh rail surface limits the temperature rise of the blocks. It is of some interest to note that "Frood's lining" gave a more uniform coefficient for different loads and speeds than either wood or iron blocks.

In the "B" set of tests blocks were loaded and hauled along the rails in the Kingsway subway, the rails being either "clean and dry," or "slightly damp." This set shows wood as decidedly superior to either cast or wrought iron. Oak, ash, elm, maple, poplar, Frood's lining, cast iron, and wrought iron were all tried at two loads equal to about 30 and 45 lb. per square inch respectively, at speeds up to 15 or 16 m.p.h. Excepting maple, the wood blocks gave an average coefficient of about 0·5. With oak and poplar the higher loading gives the better results, oak being slightly superior at the higher speeds. Frood's lining is little affected by either loading or speed, and is a little lower than the two best woods. Cast iron gives under 0·2 for the smaller loading, and shows no regular connection between speed and coefficient variations. At the heavier loading the coefficient falls from 0·37 at 6 m.p.h. to 0·211 at 18·5 m.p.h. Wrought iron is also slightly better at the heavier loading; the coefficient falls from 0·31 at 6 m.p.h. to 0·276 at 18·5 m.p.h.

Similar tests in the Municipal Tramways Association report, Appendix A, give the coefficient of birch blocks as between 0·361 and 0·41, according to the direction of the grain; and that of cast iron as 0·25; both on a clean, dry rail, at 2 m.p.h. No particulars of specific loading are given, and no other wood seems to have been tried. Appendices D and L give a better set of tests. In this wood blocks (kind of wood not stated) give on a dry rail coefficients varying from 0·46 at 2·8 m.p.h. to 0·38 at 15 m.p.h. Plain cast iron blocks give from 0·14 to 0·10, and serrated cast-iron blocks from 0·198 at 4 m.p.h. to 0·18 at 15 m.p.h. In these tests the load was 840 lb. on 17 sq. in., or say 50 lb. per sq. in., for the wood and plain iron blocks, and 65 lb. per sq. in. on the serrated blocks. These results confirm the Kingsway tests as regards the relative position of wood and cast iron, but apparently some wood less suitable than oak or poplar was used.

On clean, wet rails the information is less abundant. The T. and L.R.A. report, Appendix I., "C," gives some tests with poplar and oak blocks, in which poplar gave coefficients of 0·137 and 0·149 at speeds between 5 and 6 m.p.h., while oak gave 0·126 at 6·7 m.p.h., and 0·08 at 10·66 m.p.h. Magnetic track blocks gave from 0·31 at 4·73 m.p.h. to 0·235 at 9 m.p.h. The loading in these tests was probably too low for the best results.

The Municipal Association Appendices D and L show the wooden blocks on clean, wet rails as giving from 0·218 at 4 m.p.h. to 0·182 at 13 m.p.h., plain cast iron from 0·2 at 4·6 m.p.h. to 0·181 at 15 m.p.h.; and serrated cast iron blocks from 0·3 at 4 m.p.h. to 0·25 at 15 m.p.h.

For "greasy" rails the information is still more scanty. There is an initial difficulty in determining the "greasiness" of a rail, and in producing for test purposes a surface similar to that of a rail in a muddy street. Also the grease of one district differs from that of another, and it is quite likely that the lubricating effects on different block materials are various. Most tramway managers in hilly districts prefer wooden track blocks, but a few say that iron blocks are better on greasy rails. Local differences no doubt account for the different opinions. The Municipal Association

Digitized by Google

Committee, in their tests for Appendix A, greased rails in a shed with a mixture of lampblack and oil. In Appendix C, they mixed with that compound equal quantities of river sand, and two kinds of crushed clinker. The pure grease results can hardly have any bearing upon practical conditions, and need not be considered. The greasy dirt mixtures are more like mud grease, but the resemblance is rather distant. At the constant speed of 2 m.p.h., wood blocks gave coefficients of 0·171, 0·179, and 0·159; and cast iron blocks 0·192, 0·168, and 0·155 respectively, the wood being better than the iron in two out of the three cases. The loading is not given, and the absence of tests at higher speeds is regrettable.

The T. and L.R.A. Committee, Appendix I., "C." made some tests with London clay slurry, with which wooden blocks gave coefficients varying from 0·29 to 0·091 at speeds varying between 4·56 and 9·9 m.p.h., whilst magnetic track blocks gave from 0·267 to 0·16 through a similar range of speed. Clay slurry is probably rather nearer street mud, as a lubricant, than oil and lampblack, but as one who witnessed the experiments the writer feels that they were insufficient to dogmatise upon.

To form an opinion upon the tests reported by the two committees is very difficult, but there is ground for saying that the minimum coefficient of friction is given by cast iron blocks on clean, dry rails. On clean, wet rails serrated cast iron blocks and steel magnetic blocks are better than wood. On greasy rails, it depends upon the nature of the grease and the specific pressure on the blocks. It is probable that for every material and every kind of mud there is a specific pressure which gives a maximum coefficient of friction.

The high values given by the Municipal Committee's tests for serrated cast iron blocks on wet rails are very interesting, and it is most desirable that tests on greasy rails should be made and the results published. The area of the serrated shoes being only 13 sq. in., the specific loading was 65 lb. per sq. in., and as the Kingsway experiments show that for cast iron the coefficient of friction increases between 30 and 45 lb. per sq. in., part of the effectiveness of the serrated blocks is probably due to this. The Committee suggests that the scraping action of the successive leading edges improves the braking effect, but the block can hardly act as a file, and, if it does, the effect on the wear of the rails will need consideration. If the efficiency is maintained on greasy rails, it may very well be because the rail cleaning is more effectually done, each successive edge having an opportunity to raise any dirt that may have escaped its predecessors.

As the mud or grease on the rail is the chief element of uncertainty in the action of brakes (and in the adhesion of wheels), it is most important to keep tramway rails as free as possible of such dirt. With clean rails, either wet or dry, friction and adhesion coefficients can be relied upon; with muddy or dusty rails the values are problematical, and vary not only from minute to minute, but from inch to inch. To watch a drawbar dynamometer on a towed car on a street tramway is a surprising revelation of irregular tractive resistance and adhesion values, mainly due to dirt.

For the purpose of car control on steep gradients, wooden blocks have been in very general and successful use for many years. The writer has fitted them to many cars so worked, and has not yet heard of a fatal runaway accident resulting from their failure when properly maintained and used. But, as stated above, there appear to be some districts where the local grease makes them untrustworthy, and the safe course is to try various blocks on new lines and equip the cars with what gives the best results. The rapid wear of wooden blocks is troublesome, and the block carriers need careful design to facilitate rapid replacement and secure holding of the wood. In this connection Mr. Freund's device of a self-feeding carrier, which feeds the block down as it wears, is worthy of attention, in the interests of reliability and economy in blocks.

Magnetic blocks must be of iron or steel, but it is apparent that there are considerable differences in the coefficient of friction as between different kinds of iron, so that there is room for investigation here. The specific loading in this case is independent of the car weight, and may approximate to 150 lb. per sq. in. of pole surface, corresponding to saturation. Hence with even a low coefficient much greater braking forces may be available than with blocks having a total load limited to something under half the weight of the car. Such great forces as are given by magnetic brakes are not necessary for control on gradients, because any gradient needing them would be unclimbable by adhesion.

It is noteworthy that no tests are on record of the result of sanding rails on track-brake effectiveness. Degree and effectiveness of sanding are nearly as hard to define and measure as greasiness of rails, and it is easy to understand why this additional variable has not been considered by the Committees. It undoubtedly has a material effect upon the choice of track-brake shoes.

To sum up the subject:—In the present state of our knowledge wooden blocks are the most generally suitable for car control on gradients, but experiment in every new case, with special reference to the local mud, is desirable. Serrated cast iron blocks are hopeful, and may supersede wooden blocks if they do as well on greasy as on wet rails. Further experiments are desirable as to the local differences in greasy rails, in sanding for track brakes, the best specific loading for different materials, and in the use of serrated iron blocks.

The removal or prevention of grease on rails is a most important means of preventing runaway accidents.

Frood's lining has been mentioned as tried in the Kingsway tests. This material is doing excellent service as a wheel brake on the London tube lines, but it is doubtful whether it would have a reasonable life as a track brake. However, it is worth a trial by anyone who has the time and appliances available.

It may be noted, finally, that any gradient climbable by adhesion may be safely descended by the assistance of brakes depending on the weight of the car alone, always provided that the descending speed is kept below a critical point depending on the various elements of gradient, adhesion, and friction coefficients.

New C. B. Telephone Exchange at Shipley.—On Saturday March 20th, at 2 p.m., the National Telephone Company transferred the subscribers connected to its Shipley exchange to the new central battery equipment which has been manufactured and installed by the Western Electric Company of North Woolwich. The equipment, which is of the Western Electric Company's No. 9 C.B. type, consists of four subscribers' positions giving accommodation for 400 lines, one incoming order wire junction position, and one both-way junction position. The ultimate capacity of this type of switchboard is 800 lines. A description of the No. 9 switchboard is given in an article by Mr. Sandell on "East Ham Exchange," which appeared in Electrical Engineering, March 5th, 1908 (Vol. III., p. 355).

A Fire-Proofed Cable.—The Armorduct Manufacturing Co., Ltd., has sent us a sample of an ordinary vulcanised rubber cable, the braiding of which has been treated to render it fire-proof. The rubber, of course, is inflammable, but on applying a light to it, the flame does not travel beyond the braiding. Of course, if the cable were subjected to great external heat, it is possible that the rubber would ooze through the braiding, but the latter is fairly tight in the sample sent us, and in ordinary circumstances would offer a considerable degree of security. For wiring the backs of switchboards, &c., when it is not feasible to use lead-covered cable, this cable should have considerable utility. The company informs us that the cost of this cable is only 7½ per cent. above that of ordinary cable.

ELECTRIC DRIVING OF REVERSING ROLLING MILLS

Revocation of Ilgner Patents Applied for

On February 18th application was received at the Patent Office for the revocation, under Section 27 of the Patents Act, 1907, of the two fundamental patents for the Ilgner system of electric driving of reversing rolling mills and similar machinery with variable loads, on the ground that the patented articles are manufactured exclusively or mainly outside the United Kingdom. The present owners of the patents are the Donnersmarkhütte Oberschlesische Eisen-und Kohlenwerke Akt.-Ges., of Zabcze, Germany, to whom the patent was assigned by the inventor, Carl Ilgner; and the applicant for revocation is James Gray, the Managing Director of the Electrical Construction Co., of London and Wolverhampton.

The case is in one respect parallel to that now before the Court, in connection with the Bremer flame arc lamp patent, as an action for infringement had already been commenced by the patentees, and the petition for revocation was made as a counter move by the alleged infringers. An interesting point in the present case, however, is that when the patentees were called upon to leave their declaration in answer, in accordance with the Patent Office rules for procedure in such cases, they replied that, on a proper construction of the Act read with the rules, they ought not to be called on to leave evidence until the applicant had made out a *primâ facie* case, or had given evidence in support of his allegations. They also claimed that, if, in the alternative, it was read that it was left to the Comptroller's discretion to order such evidence to be left with the application, he should issue such an order in this case.

A special hearing before the Comptroller on this question was held, and the Comptroller gave his decision on March 20th, that the usual course must be followed, and called upon the owners of the patent to deposit at the Patent Office, within fourteen days, their declarations in reply to the petition.

Mr. J. Hunter Gray and Mr. Hume appeared for the patentees, and Mr. Russell Clarke for the applicant.

In his decision, the Comptroller states that, in his opinion, the Legislature deliberately intended to relieve the applicant from the necessity of making out a *primâ facie* case, or of proving, without help from the patentee, that the patented article is manufactured exclusively or mainly outside the United Kingdom. He sees no hardship or injustice in this, on the assumption that the Legislature treats adequate working in this country, when the main or exclusive working is abroad, as a public duty attaching to the monopoly granted here.

The facts as to working in this country are obviously within the knowledge of the patentee, and often within his knowledge alone. The applicant cannot prove a negative, and would in most cases find it absolutely impossible to give any useful particulars without "discovery" from the patentee. The rules, therefore, call on the patentee, at once, to disclose his case without waiting for any particulars from the applicant; and, the Comptroller adds, if the patentee can be protected against dishonest and bogus applications, there is no unfairness in his being called upon to do so. Protection is provided against such *mala fide* petitions by the power vested in the Comptroller to call the applicant before him and examine him or to call for a sworn declaration if necessary, or to appoint a preliminary hearing at which both parties may be heard, and the proceedings stayed where necessary. Moreover, a dishonest application, even if fully proved, need not be granted by the Comptroller under Section 27. It was said that, adopting the view that the Comptroller has a discretion to call on the applicant to make declarations, or to be examined before him in exceptional circumstances and even to refuse to proceed with the case, it was a good ground for the exercise of such powers that an action of infringement had been commenced by the patentee against the applicant, *before* the proceedings under Section 27 were taken. In this particular case an action for infringement had been commenced, and the pleadings were closed before the present application for revocation was filed. The Comptroller points out that, under the Act, it is specifically provided that where an action for infringement is pending, no application shall be made for amendment of the specification on the one hand, or on the other hand for revocation on such grounds that the patent is anticipated by an earlier patent or that the specification is not as it should be, but such a provision was deliberately omitted in Section 27. Its omission would thus seem by implication to authorise a defendant in an infringement action to make an application under the section. He admits that the whole circumstances should be considered in each case, above all, the state of the action in the High Court, the pleadings and any other relevant facts, as there might be cases where the process would be an abuse, and used for improper purposes, in which case the use of the Comptroller's discretionary powers would, he thinks, be amply justified. If, for example, in any case it was clearly shown that the applicant was making use of the proceedings merely to fish out a case against the plaintiff in an infringement action, the Comptroller should be prepared unhesitatingly to use any of the discretionary powers he possesses.

In this case, however, after careful consideration, he does not think it necessary to call upon the applicant to leave a declaration or make any explanation. The pleadings were closed in June before Section 27 came into operation, and Mr. J. Hunter Gray very frankly admitted that in this case there was no question of *mala fides* or suspicion.

The following are brief abstracts of the two patents in question:—

Patent No. 7,188 of 1902 was granted to Carl Ilgner of Donnersmarkhütte, and relates to the electric driving of reversible rolling mills. The object of the arrangement described is to reduce the fluctuations in the current demand caused by the switching in of the motor, and to enable the frequent changing of the direction of rotation and of the speed of rolling to be effected in an economical manner. Power for the rolling-mill motor is taken from the generator of a motor-generator which is provided with a heavy flywheel, and is run from the main supply. Both the starting and the speed control of the rolling-mill motor are effected by varying the excitation of the generator.

The flywheel prevents the speed of the set from being reduced suddenly when the rolling-mill motor makes a sudden demand for power, and thus prevents an excessive flow of current from the main supply. To supply the demand, however, the flywheel slows down and gives up a portion of its kinetic energy to the dynamo, which, in turn, delivers it to the rolling-mill motor in the form of electrical energy. When the demand is below the normal, the set speeds up and stores energy in the flywheel. If the rolling-mill motor and the generator of the flywheel set are shunt-wound, the former can be quickly arrested by reducing the terminal pressure of the generator below that of the motor. The latter then acts as generator and drives the flywheel set. The motor of the flywheel set must be designed to drop in speed when an increase of the load takes place, and must have a limited maximum speed.

The patent has only one claim, which is as follows:—

The herein described arrangement for regulating the velocity of electrically-driven reversible rolling-mills without the use of switched-in resistances, and for effecting a gradual demand of current from the main current source so that the said demand of current does not rise to the full amount of current consumption corresponding to the work required by the rolling-mill motor on starting, consisting of a rolling-mill motor driven by a current from a motor-dynamo driven directly from the main current source and provided with flying masses, the E.M.F. transmitted to the rolling-mill motor being regulated by alteration of the field-magnet excitation of the dynamo part of the motor-dynamo which generates the current for the rolling-mill motor.

Patent No. 13,556 of 1902, also granted to Carl Ilgner, relates to the same class of load equalising set as described in the specification abstracted above, and describes means for obtaining a speed variation of the flywheel set wider than that due to the inherent properties of the motor under the influence of the varying load. This not only permits of a much larger amount of kinetic energy being taken out of the flywheel, thus allowing the main motor to take an excessive current for a longer period without the supply being affected, but also enables the periods of rest between the hauling or rolling operations to be more fully utilised in storing energy in the flywheel.

In order to obtain this wider range of speed, regulating resistances are employed in connection with the motor of the flywheel set, and these are controlled

Digitized by Google

automatically according to the load on the dynamo or otherwise. With a continuous-current supply, these resistances may be in either the field or the armature circuit. The case of a three-phase motor, in which the regulation is effected by a centrifugal governor, is described and illustrated in the specification, and the figure is reproduced below.

In this diagram *F* is the rolling-mill or hauling motor, which is provided with a series field winding *W* and a reversing switch *U*. The flywheel set is represented by the motor *M*, the dynamo *D*, and the flywheel *S*. To vary the excitation of

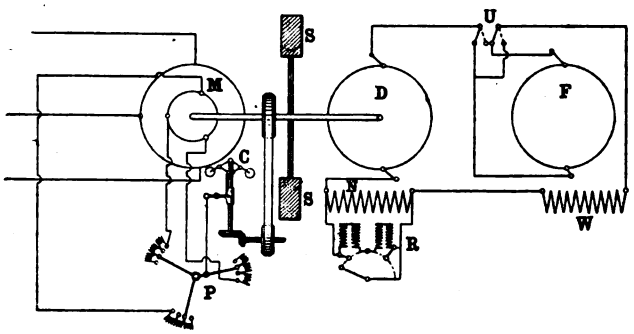

Diagram of Connections for a Three-phase Supply.

the dynamo, the field winding *N* is provided with a variable diverter shunt *R*. Belted to the flywheel shaft is an ordinary centrifugal governor *C*, which controls the rotor resistance *P* of the three-phase motor. When the main motor is working at any load above the average, the speed of the flywheel set decreases, and kinetic energy is transformed into electrical energy. There must be a corresponding increase in the slip of the induction motor, however, and in order that this may take place without the current from the supply source increasing, resistance is automatically inserted in the rotor circuit. Thus, the longer the extra demand lasts, the lower becomes the speed of the flywheel set, and the higher the value of the resistance inserted. Directly the demand falls below the average, the flywheel set increases in speed, and the resistance is gradually cut out of the rotor circuit.

Two claims are attached to the specification:—

(1) Means for regulating the velocity of motors for electrically-driven hauling or other similar intermittently loaded plant, by which energy is supplied to the hauling motor indirectly by a motor-dynamo driven by the main source of supply and provided with flying weights, the E.M.F. supplied to the hauling motor being adapted to be regulated by the alteration of the excitation of the current delivering part of the motor-dynamo substantially as described and for the purposes set forth.

(2) In such regulating means as claimed in Claim 1, for maintaining a uniformly constant demand of energy from the source of supply, means whereby the work of the motor of the motor-dynamo can be regulated so that at any alteration of the number of revolutions of the motor caused by an alteration of the load of the dynamo and the energy of the flying weights, the amount of energy required by the motor from the source of supply remains as uniformly constant as possible, substantially as described and for the purposes set forth.

Reversing Rolling Mills at Messrs. Alfred Hickman's Works

THE rolling mills at the Bilston works of Messrs. Alfred Hickman, Ltd., have recently been equipped for electric driving by the Electrical Construction Co. Complete technical details with regard to the plant are obviously not available for publication prior to the hearing of the cases above referred to, but the following information, which has been published in the daily Press, may be of interest to our readers.

Power for driving the mills is generated at the works by gas-engine sets running on blast-furnace gas. The dynamos of these sets supply power to the motor of a flywheel set, which includes two cast steel flywheels, each weighing 32 tons, and two continuous-current generators. Motor, generators, and flywheels are all mounted on one shaft, and run at a speed of 300 r.p.m. One generator supplies current to a motor driving a 36-in. cogging mill, and the other to a motor driving a 24-in. finishing mill. Although the capacity of the gas-driven sets is only about 1,000 h.p., the kinetic energy of the flywheels enables as much as 12,000 h.p. to be developed for short periods.

The mills are reversed in the usual way by altering the direction of the current supplied to the motor, and it is stated that they can be reversed in about six seconds, from the full speed of 120 r.p.m. in one direc- to full speed in the other direction. The steam-driven mills originally used at these works will be discarded. The new mills have been supplied by Messrs. Lamberton, of Coatbridge, and the gas engines by the Premier Gas Engine Co., of Sandiacre, Nottinghamshire.

It was stated in a contemporary that this is the first reversing rolling mill in this country to be driven electrically, but we believe that it was anticipated by a mill at Messrs. Dorman, Long & Co.'s works at Middlesbrough, which was equipped by the Electrical Co., Ltd., upon the Ilgner system some time ago. A description of these mills with a complete diagram of the electrical connections was given in Electrical Engineering, Vol. IV., page 540.

CORRESPONDENCE

BATTERIES AND TRANSMISSION LINES.

To the Editor of Electrical Engineering.

Sir,—Mr. Orsettich's communication to the discussion on my recent Paper arrived too late to be replied to along with other speakers, and I would like, with your permission, to say a few words now in reply to same through your columns. Mr. Orsettich has somewhat lost the point of my Paper, and his remarks, though perfectly sound, do not, therefore, invalidate my arguments. He assumes that any existing transmission scheme can double its voltage. Doubtless, this is so for short transmissions, but I was considering the case of a long transmission on which it was necessary, from the first, to adopt the *highest* feasible voltage. Given a limit in the voltage, my contention is that it is possible, with storage, to consider a transmission over a distance that would otherwise be impracticable. I do not see that it is in the least material whether I have chosen too low a limit for consideration, or otherwise.

The next point on which I find myself in disagreement with Mr. Orsettich is in his statement as to the objection of converting alternating current into continuous, "with its well-known handicap of rotating machinery and expensive switchgear." He evidently has not realised that I propose to pay for the above, as well as the cells, out of the savings in generating plant and head works, and *not* out of the savings in the line. I have cited actual cases where the costs of such head works and generating plant come out at £50 and £60 per kw., and I gather from a Paper by K. Thielsch, on this subject, that £36 to £40 per kw. is a not uncommon figure for the cost of head works *alone*, without turbines or generators, where the "heads" are low. So long as the combined cost of head works, turbines, generators, step-up transformers, switchgear, and power-house is not less than, say, £15 per kw. (including spares), the accumulators and rotaries could be reckoned as being paid for out of the power-house savings, and the line need not be debited with them. I do not suggest using them where the power-house costs are less than this, unless the saving in fixed charges will pay for the difference; which is quite probable, however.

As regards the method of distribution, Mr. Orsettich is wrong in thinking that I would propose to distribute with direct currents. With respect to the last point raised by Mr. Orsettich, I am considerably interested to know who pays for that "large amount of reserve power which can be used to overcome the drop of the line at the moment of maximum demand." Granted that 60,000 volts may be used; granted that the limiting distance may be doubled; granted also that the cost of copper in the line may be reduced to that proposed by me by the simple expedient of allowing a 40 per cent. combined drop in the line, I still want to know who pays for the extra 20 per cent. of E.M.F. at the generating station at the time of peak load, not to mention the difficulty of voltage regulation at the substation end, with a varying load.

Mr. Orsettich would put in generators having a range in voltage of 40 per cent., or 26 per cent. more than in my proposal (for I have proposals for eliminating the reactance drop), and these generators must absorb at least 20–25 per cent. more power than my generators would need to do, because double the load is transmitted. This power would cost anything from £15 to £50 per kw., and even then would give unsatisfactory regulation at the distant end of the line. Why not put in batteries and rotaries (for a five-hour peak, not a few minutes, as Mr. Orsettich seems to figure on) at a cost of £15 per kw., and avoid further trouble, and gain greater reliability of supply against breakdowns, both in line *and* in generating station?

Yours faithfully, A. M. Taylor.

King's Heath, Birmingham.
March 25th, 1909.

PROGRESS IN THE ELECTRICAL EQUIPMENT OF THE L. B. & S. C. RAILWAY CO.'S SOUTH LONDON LINE

CONTINUED progress is being made with the electrical equipment of the London Bridge–Victoria section of the London, Brighton, and South-Coast Railway, and trial runs are now being made with a complete three-coach train on that portion of the line between Peckham Rye and Battersea Park. It is on this section that the test runs and the training of the drivers, who are being selected from the company's staff of locomotive drivers, will take place. Although the whole of the overhead equipment from London Bridge to Victoria will have been completed in about six weeks' time, the test and trial runs will not extend over the whole section, as they would interfere with the running of the main line trains, which use the same track between Peckham Rye and London Bridge, and between Battersea Park and Victoria. The eight three-coach trains are complete, but only the one train is in London, as the car sheds at Peckham Rye are not yet finished. Slight alterations to the train equipment which may be thought advisable in the light of the experience with the train now running, can also be carried out more easily at Birmingham. It is expected that the service will be in regular operation for passengers in July.

On Saturday a large number of members of the Junior Institution of Engineers visited Denmark Hill station, and after an inspection of the switch cabin had been made, Mr. Philip Dawson, the electrical advisor to the L.B. & S.C. Railway Co., brought out the test train and demonstrated its working. By the courtesy of Mr. W. T. Dunn, the secretary of the Junior Institution of Engineers, our representative was permitted to join the members on this visit, and afterwards was kindly afforded the opportunity by Mr. Dawson of accompanying him on a run from Denmark Hill to Battersea Park and back.

A general description of the overhead equipment and the rolling-stock was given in ELECTRICAL ENGINEERING of February 11th, p. 132, but the following additional details are of interest.

The high-tension current collected from the trolley-wire, which has a frequency of 25 cycles, is conducted through the fuses in the high-tension chamber of the motor-coach to the power-transformers under the coach. These transformers supply current to the four 115-h.p. motors at pressures varying between 150 and 750 volts. The motors run at a speed of 600 r.p.m. at the normal load, and have a maximum speed of 1,300 r.p.m. A gear ratio of 2:1 is employed. The weight of each motor is 2·4 tons, or 2·6 tons with gear and gear-case. In the motorman's compartment at each end of the train are an ammeter and voltmeter, indicating the current and voltage in the high-pressure circuit, and supplied from special transformers. On Saturday's run the pressure indicated was nearly 7,000 volts, the normal working pressure being 6,700 volts. At starting the current rose to a maximum of 80 amperes, the average value during acceleration being about 60 amperes. As the two power circuits of each train are quite independent, the control circuit only being common to both motor coaches, the total current supplied to the train was 120 amperes, or a maximum of 160 amperes.

There are fuses in each motor circuit and isolating switches also. In the high-tension chamber there are two fuses, one for power and the other for lighting. If it is required to gain access to this chamber, the motorman inserts a key in the lock of the door (there is only one key for each train), and by turning this key opens a valve connected to the air cylinder of the raising gear of the collector bow. This causes the air to escape, and the springs which hold up the bow to fall out of action, so that the bow comes out of contact with the line. As it falls, an arm which is connected to the bow by levers and prevents the door from being opened, moves into a horizontal position out of the way of the door. There are two such arms over each door, one for the forward running, and the other for the backward running bow. A switch connecting the high-tension circuit to earth, and held open by a stop fixed to the door, closes as the door is opened, and thus ensures that the apparatus in the chamber is dead. The bow cannot be replaced until the door is closed.

The overhead construction, which has been supplied and erected by Messrs. R. W. Blackwell & Co., is an excellent example of British solidity and thoroughness, and owing to the numerous difficulties which have been overcome, is well worth a visit by anyone interested in such work. The bridges in particular have been a great source of trouble. The lowest bridge is that some 50 yards to the Victoria side of Denmark Hill station: the clearance betwen the trolley-wire and the roof of this bridge is only 4½ inches. In the case of one bridge near Battersea Park, it was deemed inadvisable to run a live trolley-wire under the bridge, and so the short portion of wire under the bridge was isolated from the main wire and earthed. This earthed portion merely serves to keep the bow in position when travelling under the bridge. When passing this earthed section the four motors supplied from the bow on that section are without current for a second or two. Should the train be stopped with one bow on the dead section, it can be started with the four motors at the other end of the train only.

There is at present a continuous service of steam trains on the Denmark Hill—Battersea Park line, and, in consequence, a considerable amount of soot is deposited on the contact wire. The burning off of this soot, however, caused only a slight amount of sparking at the contact of the collector bow; the acceleration and the general behaviour of the equipment were also excellent.

Manchester Local Section Committee, 1909-10.—We give below the Chairman and members of the Committee of the Manchester Local Section of the Institution of Electrical Engineers, who were elected at the annual general meeting on the 23rd inst.: Chairman, S. J. Watson (Chief Electrical Engineer, Bury Corporation); Vice-Chairman, J. S. Peck (British Westinghouse Co.); Members, C. J. Beaver, Dr. F. H. Bowman, W. Cramp (Manchester Municipal School of Technology), A. A. Day (Chief Electrical Engineer, Bolton Corporation), A. P. M. Fleming (British Westinghouse Co.), A. C. Heap (Messrs. Eckstein, Heap & Co.), G. Layton (British Westinghouse Co.), V. A. H. M'Cowen (Chief Electrical Engineer, Salford Corporation), S. L. Pearce (Chief Electrical Engineer, Manchester Corporation), Dr. E. Rosenberg (British Westinghouse Co.), Prof. A. Schwartz (Manchester Municipal School of Technology), C. D. Taite (Chief Electrical Engineer, Lancashire Electric Power Co.); Past Chairmen (Ex-Officio Members of the Committee), T. L. Miller, M. B. Field (Messrs. Ferranti), and Miles Walker (British Westinghouse Co.); Hon. Secretary and Treasurer, H. W. Wilson, 19 Brazennose Street, Manchester; Assistant Secretary and Treasurer, A. L. Green, 2 Churchill Avenue, Manley Park, Manchester

---

"Z" Electric Lamp.—An action is pending between the "Z" Electric Lamp Syndicate, Ltd., and Mr. S. Zossenheim, the agent in Great Britain of the Econo Electric Lamp for infringement of patent, and the matter has been mentioned several times in Mr. Justice Parker's Court of the Chancery Division. The "Z" Electric Lamp Syndicate have been making an application for an injunction to restrain the defendant from selling his lamps in this country pending the trial of the action, but the hearing of this motion has been adjourned from week to week to give Mr. Zossenheim an opportunity of defending it. On Friday, however, when the case was again mentioned before Mr. Justice Parker, Mr. J. Hunter Grey, who appeared for Mr. Zossenheim, stated that he had been unable to get the necessary evidence to defend this motion, and could not resist the interim injunction being granted.

A SMALL LABORATORY SWITCHBOARD
(Communicated)

THE electrical requirements for a laboratory are as varied as numerous, ranging, as they do, from lighting to the working of induction coils, from supplying current to galvanometer lamps, wheatstone bridges, and other testing apparatus to providing the necessary power to various small motors (light drills and lathes, stirrers, stroboscopes, &c.). Besides these, when the source of power is a battery of accumulators, these must have their voltage frequently tested, as often as not when they are in actual use, and therefore without disconnecting any cell, or, as a matter of fact, without altering a single connection. Means must be provided to do this readily, or else it is apt to be neglected with ruinous result for the cell, and not infrequently great inconvenience arising from the failure of the source of power in the course of a work which has to be carried on continuously. A further requirement is suggested by the wide range of voltage needed, and by the fact that accumulators keep their charges much better and more uniformly if connected in parallel than if connected in series, as the latter implies higher terminal voltage, causing leakage and "creeping"; it is, therefore, a great advantage to be able readily to change the series-parallel grouping from one of the possible combinations to another, so as to leave the cells connected in parallel when not in use. A certain number of spare cells, say, a quarter of the number in regular use, should always be kept charged, ready to replace the weakest cells of the battery, the latter being in turn put on charge, this being done every morning so as to have always the full power available, and keep the cells in good working condition; they must therefore be arranged so that easy and rapid removal and replacement is possible.

These numerous requirements have been met by the following arrangement, adopted after careful consideration of the various conditions obtaining, the switchboard being mounted in the private laboratory of Mr. M. E. J. Gheury, in Eltham, supplying power for lighting the room by means of 16-c.p. Osram lamps, the working of an X-rays installation, small motor tools, and various electrical testing apparatus; its extreme convenience, simplicity, adaptability, reliability, and low cost has amply justified the lines followed in its design.

The main principle that determines the general arrangement of the connections is shown in Figs. 1 and 2, one of the terminals *c* of the battery *B* being connected through an ampere-meter, *A*, to one of the two main terminals *T*, while the other is connected through one of the contacts *b* of a two-way switch, *E*, to the resistance coils of a rheostat, *R*. The other contact *a* of the switch *E* is connected to the other main terminal, together with the movable contact of the rheostat *R*. A voltmeter, *V*, is connected between the battery terminal *c* and the movable contact *d* of the switch *E*. With this disposition, the voltage at *T*, for a given battery grouping, can be varied at will by the rheostat. When the switch *E* is in the position shown in

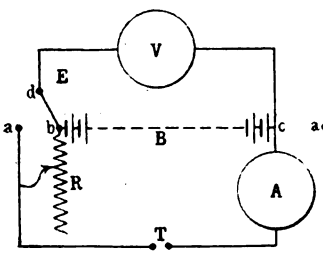

Fig. 1.

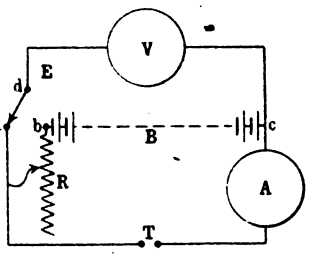

Fig. 2.

Fig. 1, the voltmeter is simply across the battery, and indicates its voltage, whatever is the voltage at *T*; when it is moved to the position shown in Fig. 2, the voltmeter is across the terminals *T*, indicating the voltage at any apparatus to which power is supplied. It is noted that by altering the position of the switch *E*, the voltage at the battery terminals can be tested as often as desired without in the least interrupting or perceptibly altering in any way the supply at *T*.

The battery, which may vary according to the requirements of the laboratory, is connected to a mercury distribution board of the usual type, shown at *B*, Fig. 3, the connections, of stiff copper wire, being designed so as to allow of rapid disconnection or connection of the cells with the board, without interrupting the supply, and without risk of short-circuit. The mercury switch panel is under a hinged glass cover, providing an efficient protection from dust, so that, even after two years' working, the surface of the mercury, although tarnished, is free from the scum that always forms on exposed mercury, and which is an objection to this very convenient form of switchboard. By placing a few pieces of stout copper wire in the corresponding mercury cups, the cell grouping may be altered at pleasure. In Fig. 3 the arrangement is shown for eight cells connected in two parallel groups of four in series. The testing of each cell singly is rapidly performed by connecting all the

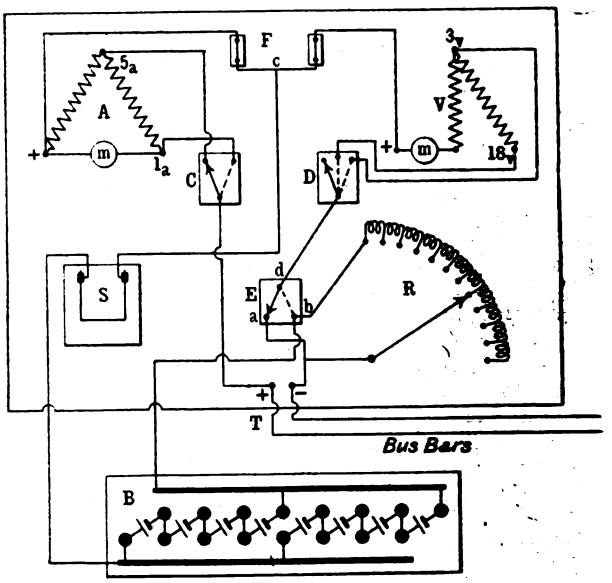

Fig. 3.

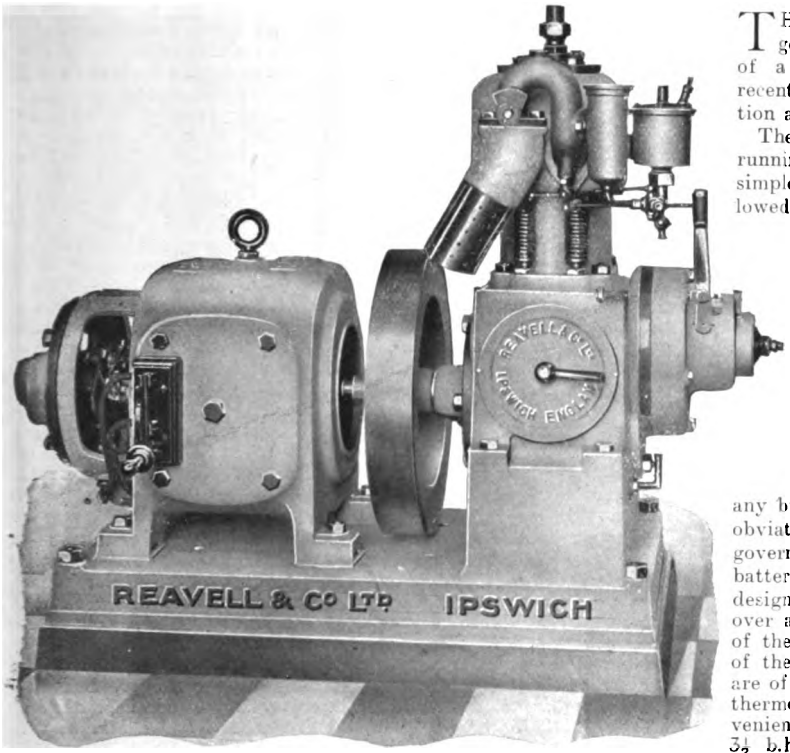
mercury cups on one side, and shifting one connecting piece from cup to cup on the other side, the voltage being taken in each position.

It may be mentioned here that each cell is numbered, and the voltage is entered as it is taken in a log-book, with the date. In the same book are entered particulars of the charging, cost of repairs, &c., so that the history of each cell is fully recorded.

The actual arrangement of the switchboard is shown in Fig. 3. The two 6-in. dial instruments, by Messrs. Everett Edgcumbe & Co., are of the moving coil type, both with two ranges, which in this special case are 0–1 amp. and 0–5 amp. for the ammeter, 0–18 volt and 0–3 volt for the voltmeter, the latter range being selected specially for testing the voltage of single cells. The connections are shown at *A* and *V* respectively, *m m* being the moving coils. The ammeter can be readily switched on either range by a two-way switch, *C*, the instrument being therefore always in circuit. A three-way switch, *D*, is used for the voltmeter, and is arranged so that a spring keeps it on the first contact, which corresponds to the "off" or open circuit position, and brings it back on that contact as soon as it is let go. The next contact is the 18-volt range contact, the last, the three-volt range contact, so that it is impossible to switch the whole battery on the three-volt range by accident, and so bend the pointer. It is also impossible to leave the voltmeter "on" by neglect. Further protection is given by two fuses, *F*, one on the circuit of each instrument. A spring release single-pole switch, *S*, closes the circuit.



From the terminals *T*, two wires run along the walls of the laboratory, and from these the current can be tapped at conveniently placed terminals.

Royal Institution.—The following are among the lecture arrangements at the Royal Institution after Easter:—Professor W. E. Dalby, two lectures (June 3rd and 10th) on "A Modern Railway Problem: Steam *v.* Electricity." The Friday evening meetings will be resumed on April 23rd, when Mr. Alexander Siemens will deliver a discourse on "Tantalum and its Industrial Applications." Succeeding discourses will be given by, among others, Professor J. A. Fleming on "Researches in Radiotelegraphy," and Professor Sir James Dewar.

Cable Tunnel under the Tyne.—The tunnel under the River Tyne, constructed for the Newcastle Electric Supply Co., which was commenced in 1907, is now completed, and the cables laid in it will be connected up in the course of the next few weeks. The tunnel forms a direct connection between the Newcastle Electric Supply Company, Carville power station, and the main cable system of the County of Durham Electric Power Distribution Company, Ltd., at Hebburn. The depth of each shaft on both sides of the river is about 80 ft., and the diameter of the tunnel is 6 ft.

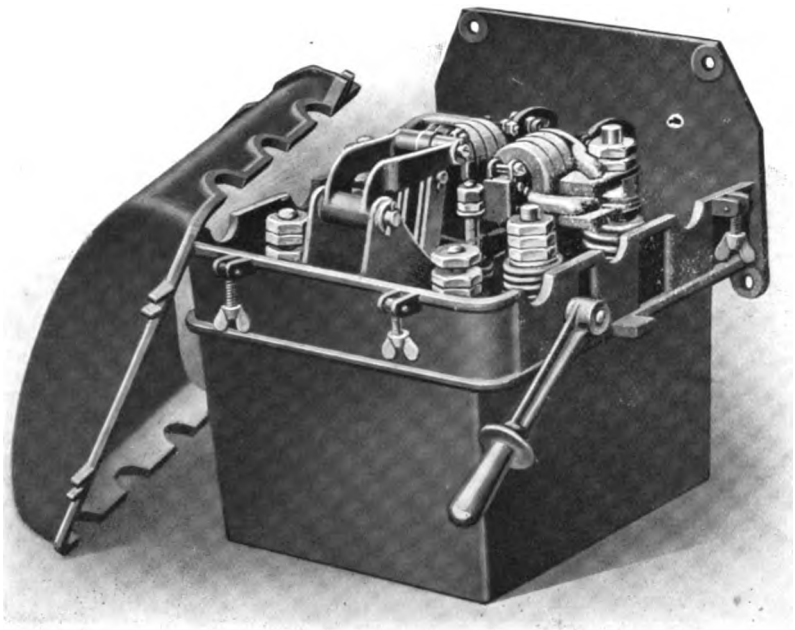
PARAFFIN-OIL ENGINES



SMALL GENERATING SET DRIVEN BY REAVELL PARAFFIN ENGINE.

THE accompanying illustration represents a small electrical generating set driven by a single-cylinder paraffin-oil engine of a type which Messrs. Reavell & Co., of Ipswich, have recently put on the market after a good deal of careful investigation and experiment.

These engines have been particularly designed for continuous running, and reliability has been sought in the directions of simple and substantial design. The ordinary four-cycle is followed, and a special carburettor of the firm's own design is used for which excellent results are claimed. The smallest engine ($3\frac{1}{2}$ b.h.p.) only consumes from 0·825 to 0·85 of a pint of oil per b.h.p. Starting up is effected by running on petrol for a few minutes till the vaporiser is sufficiently heated, when a turn of a three-way cock admits the paraffin. The engines can also be arranged for running on kerosene, petrol, alcohol, or town or producer gas. Splash lubrication is employed, and the engine requires little or no attention when once started up. Nickel steel is used for the valves, both of which are mechanically operated. A special arrangement is adopted to prevent any but a vertical thrust being exerted on the tappet rods, thus obviating undue wear on the bushes which guide them. The governor acts upon the throttle, and a high-tension coil and battery are used for ignition. The commutator is of simple design, and consists of a spring-controlled roller, which passes over a segment of metal arranged in a fibre ring; the position of the metal segment is adjustable, in order to vary the timing of the ignition. All bearings are of hard phosphor-bronze, and are of ample dimensions. The water-cooling can be effected by a thermo-syphon tank, by a circulating pump, or any other convenient method. Five sizes are at present listed, ranging from $3\frac{1}{2}$ b.h.p. single-cylinder at 900 r.p.m. to the 15 b.h.p. two-cylinder engine running at 750 r.p.m.

CATALOGUES AND PAMPHLETS RECEIVED

OIL CIRCUIT-BREAKERS.—Two leaflets recently issued by Messrs. Cowans, Ltd., of Springfield Lane, Salford, Manchester, describe their latest patterns of high- and low-tension oil circuit-breakers. The former are suitable for alternating-current circuits up to 11,000 volts, and are fitted, when required, with overload relays, or with reverse relays on Andrews' patent inductive balance system. If necessary a no-voltage release can be fitted, but a potential transformer must then be provided as well. The switch illustrated is suitable for either continuous or alternating current circuits, and for pressures up to 600 volts. It is especially designed for use in mines and workshops, and is fitted with overload and no-voltage releases. As can be seen from the illustration, the switch is completely enclosed, and is adapted for bolting to the wall. Two sizes are listed, namely, for 250 and 500 amperes. In connection with this latter switch, Messrs. Cowans state that experiments have shown the conductivity of contacts under oil to be even better than that of contacts in air, and that although the use of the oil-switch has been practically confined to alternating-current work, there is no reason why it should not be used with continuous currents in cases where the circuits have only a small inductance, or where, as in the case of motors, the inductive field is left closed upon the armature, thus providing for the gradual dissipation of the energy of the magnetic circuit.

LOW-TENSION ENCLOSED OIL-BREAK SWITCH.

ELECTRICAL FIRE ENGINES.—A pamphlet from the Oerlikon Co. describes a complete electrical fire engine equipped with a multiple-stage centrifugal pump driven by a 15 b.h.p. motor. The pump is capable of discharging 130 gallons per min. at a pressure of 100 lbs. per sq. in. The apparatus can be used anywhere where access can be had to connections from power mains uninfluenced by the fire, and is specially suitable for works, shipbuilding yards, railways, depots, &c.

WATERTIGHT FITTINGS.—The Sunbeam Lamp Co., of Gateshead-on-Tyne have sent us an advance copy of their new catalogue of watertight fittings. This includes a very large number of designs, no less than 48 different patterns being listed and illustrated. Among other things, there is a large selection of bulk-head fittings.

BELLS AND BELL-PUSHES.—A leaflet from the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., of Silvertown, London, gives particulars and prices of a large number of sizes and patterns of trembling and single-stroke bells, also pushes and metal pulls for use with them. Indicators, multiple-way switches, relays, contact devices, and other accessories for bell and signalling circuits are also listed. We have also received from the same company an illustrated booklet entitled "The Two-Tone Vibrating Transmitter and Cable Inductive Signalling," which consists mainly of a reprint of some articles by E. Raymond-Barker, published in a contemporary.

Digitized by Google

PRINTING PRESS CONTROL.—The General Electric Co., Ltd., of 71 Queen Victoria Street, London, E.C., have sent us a well-illustrated pamphlet describing the "Witton-James" system for the control of electrically-driven printing presses. The system can be adapted to either multiple push-button or single-station control, and is suitable for alternating and direct-current circuits. We hope to give a complete technical description of the system and its method of working in a future issue. A number of reproductions from photographs illustrating some examples of large "Witton" generating sets are included in this pamphlet. A leaflet giving a list of rotary printing press installations equipped on the Witton-James system has also been sent to us.

DIMMING AND REGULATING SWITCH.—Messrs. Adams & Co., of 109 Victoria Street, London, S.W., have sent us a pamphlet relating to the "Watkin" dimming and regulating switch. The switch consists of a multiple-way switch and a number of resistance units, one or more of which are put in series with the lamps, fan, or other device to be controlled. A demonstration of the various uses to which the switch may be put was given in the library of the Royal Institution last Friday.

THREE-PHASE MOTORS WITH SELF-CONTAINED STARTING RESISTANCE

A TYPE of three-phase motor has been developed by the Felten and Guilleaume Lahmeyerwerke Co., which shall combine the advantages of the ordinary three-phase slip-ring motor, in the way of moderate starting current, with the ease

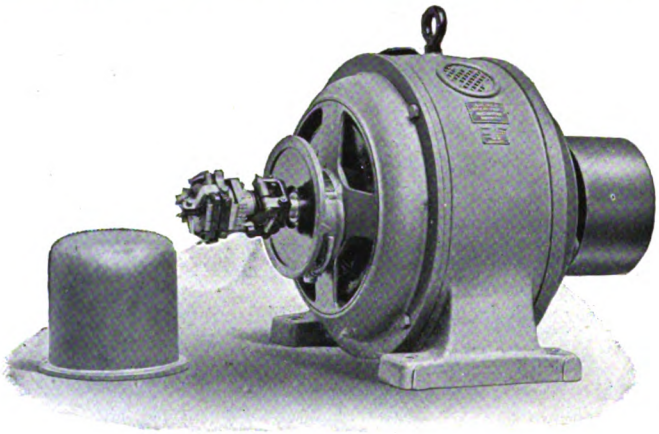


Fig. 1.—View of Motor, with Cover Removed.

of handling and small amount of attention of a simple squirrel-cage motor, which can be switched straight on to the mains.

This pattern of motor is constructed with an ordinary wound rotor, but the starting resistance, instead of being external to the machine, and connected to the rotor winding by slip-rings and brushes, is contained in the rotating part, and when the motor has nearly attained its full speed, is gradually cut out of circuit by means of a centrifugal switch. This resistance is fitted on the shaft beside the rotor with which it rotates, and has been designed in such a manner so that the standard

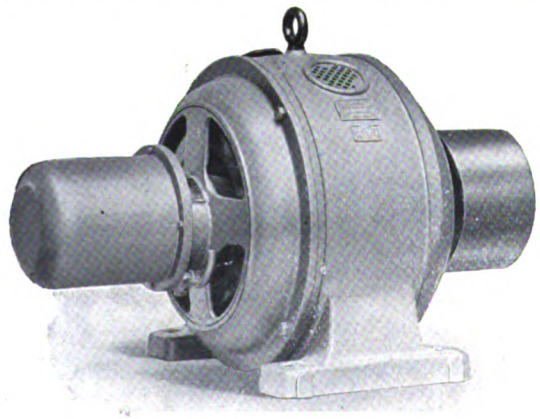

Fig. 2.—View of Motor, with Cover in Position.

appearance of the motor frame is not altered in any way (Figs. 1 and 2). The centrifugal switch, effecting the short-circuiting of the starting resistances at a certain speed, has been fitted on to the shaft on the exterior of the one bearing, and is further totally enclosed by a cast-iron cover which may be removed when desired.

Starting up thus takes place in the simplest possible way, namely, by closing a three-pole switch, while the motor starts at a comparatively high torque with a low-current consumption. The current impulse produced when the starting resistances are automatically cut out is very slight, owing to the fact that by this time the motor has attained nearly its full speed.

Motors of this type can also be used in places where otherwise only three-phase motors fitted with squirrel-cage rotors could be employed, as, for example, in mines, chemical works, &c., as the centrifugal switch and the contacts of the starting resistance are totally enclosed, thus ensuring perfect safety. The motor shown in Figs. 1 and 2 develops an output of 28-h.p. at 500 volts and 750 r.p.m.

Rugby Engineering Society.—On Saturday last a number of members of the Society visited the Birch Coppice Colliery at Polesworth, near Tamworth. They were shown over the entire surface plant, as well as the workings underground to the coal face. The mine is electrically equipped, and affords an excellent example of the superiority of electric power for operating coal mines. The membership of the Society is mainly recruited from the British Thomson-Houston Co., Ltd., and Willans & Robinson, Ltd., and the visit should prove of great practical value.

Tramway and Light Railway Association's Brakes Committee.—The Tramway and Light Railway Association's Brakes Committee has been re-appointed and enlarged especially to consider what points are needing further investigation to complete the work set out in the Brakes Report (Electrical Engineering, Vol. IV., p. 647). The new members of the Committee are:—Professor Ernest Wilson, King's College, London; Mr. P. J. Pringle, Borough Electrical Engineer and Tramways Manager, Burton-on-Trent; Mr. T. B. Holiday, Engineer and General Manager, Hastings & District Electric Tramways Co., Ltd.; Mr. J. R. Salter, General Manager and Chief Electrical Engineer, South Lancashire Tramways Co.; Mr. W. Thom, General Manager, Potteries Electric Traction Co.; and another.

Borough Polytechnic Institute.—The annual exhibition of the work of the students of this Institute was held on Saturday. Many excellent examples of technical work were exhibited, and all the laboratories and workshops were thrown open to inspection. An interesting novelty on view in the electro-chemical laboratory was a quartz mercury vapour lamp especially designed by Dr. F. Mollwo Perkin, head of the chemistry department, for investigating the action of ultra-violet rays on various gases and gaseous mixtures. The lamp is constructed in the form of a Liebig condenser, the arc being formed in the inner tube. The gas to be experimented with is passed through the space between the inner and outer tubes, and water is caused to flow over the outer tube to cool the apparatus. If oxygen is passed through, it is partially converted to ozone.

National Telephone Co.'s Employees.—We have received from the Secretary of the National Society of Telephone Employees a long letter dealing with the position of the staff of the National Telephone Co. This covers more or less the same ground as the communication from the National Telephone Co.'s Staff Transfer Association referred to in our last issue, inasmuch as it relates to the construction staff, and points out the necessity for continuing to make provision for future telephonic requirements after 1911. It is contended by the staff that some arrangement should be come to between the Postmaster-General and the Company, whereby the construction works can be carried on uninterruptedly till the end of the Company's license, each party to the agreement paying a proportionate amount of the capital expenditure entailed in ratio to the respective revenues derived. Failing this agreement, the Postmaster-General should, it is said, take into his employ the constructional staff as and when dismissed, upon the same terms as would have been granted them had they remained in the service of the Company till 1911. One of the stumbling-blocks in the way of successful negotiation is, as far as can be gathered, a difficulty arising out of the necessary renewals and replacement of old-pattern plant by more modern equipment. It is contended on behalf of the Postmaster-General that if a new exchange is erected to replace an old one, that the Government should only be called upon to pay for that new plant which will be of service to it. Whereas the Company contend that if they do not build a new exchange, that the Post Office will have to buy the old plant as a working exchange; therefore, if they build for the Post Office a new exchange, they should be paid not only the initial cost of the new exchange, but also such a price as would have been paid for the old exchange if the new one had not been erected. The Society suggest that it would be no very difficult matter for this question to be satisfactorily settled by arbitration, without the Postmaster-General going behind the provisions of the Agreement of 1905.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 25th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

14,867/08. **High Efficiency Carbon Filaments.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). The process of manufacture of so-called "metallised" filaments consists in firing the base filament to drive out impurities, flashing the fired filament in benzine vapour so as to deposit a graphite skin, and finally firing the resulting composite filament to harden the skin. It has been found that this last step causes the skin to separate from the core, and the present patent is for an intermediate step between the first firing and the flashing, in order to roughen the surface of the core. This is done by flashing the filament in air for a fraction of a second. In the next step, the deposited material fills up the pits of the roughened core, and this prevents relative movement between core and skin. The life and strength of the filament are considerably increased. Four claims.

17,348/08. **Relays for Railway Signalling Apparatus.** Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*). In electrical railway signalling systems it is advisable that the apparatus should respond neither to alternating currents nor ordinary continuous currents, as either might be accidentally introduced into the circuit. The device described in this specification responds only to a series of uni-directional impulses, and consists of two polarised magnets with windings connected in series. A current impulse in a certain direction causes one magnet to attract its armature, to which is attached a pawl. When returning, this pawl moves one wheel of a differential driving gear one tooth forward. The other wheel is moved in the opposite direction by a current impulse in the opposite direction, and thus counteracts the effect of the first impulse. Successive impulses in one direction produce the desired complete or partial rotation of the third member. Three claims, one figure.

18,278/08. **Incandescent Lamp Manufacture.** J. Kremenezky. The glass disc of the carrier is made appreciably smaller in diameter than the bulb neck, which is made wide to admit of a wide filament frame. The converging flames from the blowpipes of the sealing-in machine are caused to act on the neck just above the disc, so that the softened glass of the neck fuses on to the disc. This enables carrier discs of small diameter to be used, even when the diameter of the filament frame is large. Two claims, nine figures.

21,385/08. **Supports for Metal Filaments.** Siemens & Halske Akt.-Ges. Tungsten filaments are in some cases fused to the metal supports, which are then made of nickel or iron coated with copper. The nickel or iron forms an alloy with the tungsten at the point of fusion, and the copper is added to prevent trouble owing to the fusibility of the alloy when only nickel or iron is used. When the filaments are only cemented to the supports, or merely looped round the ends, it has been customary to employ supports of copper, as this metal does not retain occluded gases. According to the present invention, such copper supports are constructed with a core of steel to prevent them from softening with the heat, and becoming permanently deformed. One claim.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Siemens Bros. Dynamo Works, and Riber, 13,580/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Höing [Suspension of cables] 27,043/08.

Dynamos, Motors, and Transformers: British Thomson-Houston Co., and Clough [Machines] 7,327/08; Dupont, and Harlé et Cie. [Speed regulation of D.C. motors] 17,137/08; Salisbury [Commutator grinder] 19,946/08.

Electrometallurgy and Electrochemistry: Morris [Electrolytic production of aluminium oxide] 6,449/08; Nodon [Recovery of tin] 7,584/08; Lutz [Electroplating apparatus] 18,220/08; Doe [Dry cell] 18,721/08.

Ignition, Electric: Guenet [Magneto-generator] 18,106/08.

Incandescent Lamps: Coolidge [Filaments] 17,620/08.

Instruments and Meters: Murphy, and Kelvin & James White, Ltd. [Recording instrument mechanism] 6,897/08.

Storage Batteries: Elieson, 333/08.

Switchgear, Fuses, and Fittings: Myers and Gedge [Heavy switchgear] 5,628/08; Fromaget [Control of distant mechanisms] 9,676/08; Lundberg [Switches] 24,058/08; Siemens Bros. Dynamo Works, and Schupp [A.C. motor starters] 331/09.

Telephony and Telegraphy: Fessenden [Production of electric oscillations] 21,263/08; Popow [Signalling] 23,426/08; Baumer [Telephonic installations] 23,590/08; Siemens Bros. & Co. (*Siemens & Halske Akt. Ges.*) [Telephone exchanges] 2,851/09.

Traction: Lagden and Catchpole [Prevention of collisions] 8,357/08; Boult (*Union Switch and Signal Co.*) [Signalling] 9,493/08; Love [Track brake shoes] 10,327/08; British Thomson-Houston Co., and Park [Sanding devices] 11,978/08; Cummings [Brakes] 23,897/08.

Miscellaneous: Phillips [Electric pianos] 5,170/08; Parsons and Ball [Timed contact-making device] 9,917/08; Marschall [Thermo-electric battery] 12,841/08; Hay, Couper, and Lindsay [Vulcanising apparatus] 14,121/08; Alcock and Simpson [Magnetic separators] 18,855/08; Willig [Therapeutic apparatus] 20,505/08; Fairweather (*Aktiebolaget L. M. Ericsson & Co.*) [Electric clocks] 20,976/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Aktiebolaget Elektrometall [Electric furnace] 4,553/09; Bellini and Tosi [Directed wireless telegraphy] 4,801/09; Grassot [Watt-hour meters] 4,909/09; Allgemeine Elektricitäts Ges. [Control of machines] 5,318/09.

Opposition to Grant of Patents

Opposition to the grant of the following patents has been entered.

28,636/07. **Galvanising Apparatus.** S. O. Cowper-Coles. In this apparatus the wire to be covered passes over rollers first through a heated hydrogen chamber, and then through the bath of molten zinc. A current is passed through the wire to anneal it and increase the union between zinc and iron.

786/08. **Tramcar Life Guard.** W. Timbrell and C. E. Gabriel. In life guards of the pattern in which a tray is lowered by the displacement of a hanging gate in front, the operating handle for resetting the guard is, according to this invention, so connected to the guard that the latter can work without causing any movement of the handle. The lower portion of the gate is also hinged, and can swing in the forward direction, so that if the rear gate touches the ground, the tray will not be depressed nor the gate damaged.

Application for Amendment

14,510/08. **Tramway Rails.** J. H. Briggs. To minimise the formation of corrugations, the rail is given such a section that if the wheel tends to climb the crown of the rail, the inner web is depressed, causing the wheel to run on the outer side of the rail-tread. The amendment required is the addition of a clearer explanation of the action.

Expiring and Expired Patents

The following patent expires during the current week after a life of fourteen years:—

6,864 of April 3rd, 1895. **Railway Signalling Apparatus.** G. K. Winter and G. B. Winter. This patent relates to a system of block signalling for railways, in which pass tickets are automatically issued at a station when the section in front is clear.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: C. Jung, A. Brecher, and A. Kittel [Insulating composition] 26,397/98; R. Gaertner [High-tension insulators] 25,076/01.

Dynamos, Motors, and Transformers: V. Feeny (*Allgemeine Elektricitäts-Ges.*) [Revolving field-magnets] 22,362/00; J. Y. Johnson (*Electrizitäts Akt.-Ges. vorm. W. Lahmeyer & Co.*) [Flywheel load-equalising set] 27,486/02.

Ignition, Electric: J. H. Kerridge [Electrically controlled and ignited gas lamps] 29,361/97; W. G. Wilson, and Wilson & Pilcher [Several sparking-plugs operated by a common trembler coil] 27,531/02.

Telephony and Telegraphy: O. J. Lodge [Wireless signalling by magnetic induction] 29,505/97; A. Fraser, W. Judd, and G. Draper [Telegraph perforator] 24,624/99; H. Lake (*J. S. Stone*) [Wireless telegraphy] 27,272/02, 27,295/02, and 27,301/02.

Traction: C. H. Spencer [Tramcar motors as generators to retard backward running] 27,284/02.

Miscellaneous: O. H. and A. F. Pieper [Dental motor equipment] 23,692/95; G. Barker (*G. Schoeffel*) [Electrically operated valves] 28,882/97; H. Bosshard [Chain welding] 25,208/01.

Restoration of Lapsed Patents

An Order has been made restoring the following patents.

18,110/97 and 3,376/00. **Brake Shoes.** W. D. Sargent. The first patent is for brake shoes made of cast metal in which is embedded a number of layers of perforated or network sheets of a ductile metal, and the second relates to a process of chilling the ends of shoes.

THE ELECTRICAL TRADES' BENEVOLENT INSTITUTION

THE first festival dinner in connection with the Electrical Trades' Benevolent Institution was held on Tuesday at the Hotel Metropole, Mr. W. M. Mordey presiding in the absence, through illness, of Sir William Preece. Mr. Mordey was supported by Mr. R. K. Gray and Mr. J. H. Rosenthal (the latter in the place of Professor John Perry, also absent through illness), as vice-presidents. Among others present were the following:—Mr. H. W. Butler (Electrical Power Storage Co.), Mr. K. Edgcumbe (Messrs. Everett, Edgcumbe & Co.), Mr. C. S. Northcote, Mr. G. Burney (Sterling Telephone & Electric Co.), Mr. Justus Eck (Union Electric Co.), Mr. H. Bevis (General Electric Co., Ltd.), Mr. H. H. Berry (Messrs. Berry, Skinner & Co.), Mr. H. W. Handcock (Messrs. Handcock & Dykes), Mr. F. H. Nalder (Messrs. Nalder Bros. & Co.), Mr. L. G. Tate (Electrical Contractors' Association), Mr. T. J. Grainger (Sunbeam Lamp Co.), Mr. W. C. C. Hawtayne, Mr. A. F. Harris (Messrs. Nalder Bros. & Co.), Mr. A. P. Lundberg, Mr. P. A. Lundberg, Mr. E. Skinner (Messrs. Berry, Skinner & Co.), Mr. W. Schmahl (Armorduct Manufacturing Co.), and Mr. C. Wilson (Robertson Electric Lamp Works).

Mr. W. M. Mordey, in proposing the toast of "The Electrical Trades' Benevolent Institution," apologised for the absence of Sir William Preece, who, now that Lord Kelvin was dead, he thought might be called the father of the electrical industry, and read the following letter from him to Mr. Walter Davenport, the secretary of the Institution:—"I am still progressing slowly, but I shall be unable to get out this week, and if I do, my doctor wants me to go to Wales for a complete change. He thinks it would be extremely unwise of me to attend the dinner; it is a risk that I am not justified in taking at my age, and in my present condition. Hence I am reluctantly compelled to tell you I must give it up. I have thrown my whole heart into the job, and I have felt that I could not possibly end my days more satisfactorily to myself than by taking an active part in the establishment of a benevolent fund for that great industry in which I have spent my whole career, and in the development of which I have taken such an active part. Hence I am terribly grieved at having to chuck a job that was thoroughly congenial to me."

Mr. Mordey thought this letter was thoroughly characteristic of Sir William Preece, and on his suggestion the following telegram was sent to Sir William:—"The Electrical Trades' Benevolent Institution, at its first festival dinner, sends greetings and hearty wishes for speedy return to health." Sir William Preece, continued Mr. Mordey, as President of the Committee of this Institution, had taken a great interest in it ever since its foundation three or four years ago. The object of the institution, of course, was to help those who had fallen in the great race of life. They all knew that nowadays the battle of life was a hard one, and in the electrical industry—flourishing though it was—it was as hard as in any of the older professions. Men fell by the way through no fault of their own, such as the bad health, either of themselves or their families; want of success in business, and so on. And even if it were the fault of the people themselves, he thought they ought to realise that this was no reason why they should not be helped. Man was more or less what his constitution made him, and very often a man failed in business through some small defect of character; perhaps carelessness, or undue generosity; perhaps thoughtlessness, or even extreme thoughtfulness for other people at the expense of himself. It was such a man as this that the institution was formed to help. He did not want to put it forward that the institution was formed to help only those people who had never had any failings or faults. If this were so, there would be very little need for any benevolent society at all. The object of the institution was to aid any who had been connected with the electrical profession, except workmen. It was not an artisans' or workmen's benevolent society. It was for the higher grades in the trade, and in this way perhaps it was not as complete as it might be, but no doubt in time there would be organisation among the workmen themselves that would supplement, for their needs, what this institution aimed at in regard to those in the higher grades. One of the aims of the institution was to encourage the formation of local organisations away from London; to get groups of contributors and administrators who would help the institution in centres that could not be reached from headquarters, similarly to the local sections of the Institution of Electrical Engineers. This Benevolent Institution was founded practically as the result of the surplus from the very successful electrical exhibition at Olympia in 1905. The fund had grown gradually until it now stood at £1,650, and relief had already started. There had not, of course, been any cases of pensions, firstly because their funds were at present comparatively small, and secondly because the rules precluded any pension being granted until the recipient had been a subscriber for five years, and as the fund had not been in existence so long, there could obviously have been no pensions granted. In this connection he hoped that in the growth of this institution the idea would be encouraged of granting relief to those who had by their own contributions and subscriptions helped the fund themselves. These were the people who should have first claim. If this were done, he thought it would greatly increase the attractiveness of the fund amongst those who were able to subscribe. In addition to the £1,650 which he had already mentioned, there was an expectation—practically amounting to a certainty—of about £350 from the Manchester Electrical Exhibition, and it might be more. Then there was to come to the fund in 1911—and this seemed like talking of *Dreadnoughts*—a sum of £350 as the result of an investment of part of the surplus funds from the Olympia Exhibition, so that even if there were no further contributions—and he knew there had been some considerable ones—there was a sum of £2,350 available. As President of the Institution of Electrical Engineers perhaps he would be expected to say a few words about the benevolent fund of that institution. This was a fund which had been established for many years, but it was not a large fund because, as they all knew, the Institution had considered it their first duty to get a roof over their heads. But the Institution of Electrical Engineers' Benevolent Fund was formed entirely for those who had been members or associates of the Institution, but the fund for which they were meeting that evening had no such condition as that. In fact, he took it that there was no reason why members of the Institution of Electrical Engineers should not benefit by this fund, but at any rate there was nothing in the nature of competition between the two. In fact, in his personal capacity, he would like to throw out the suggestion that there should be some sort of co-operation between the two funds. There might be occasions when it would be quite possible for them to co-operate in special cases when perhaps neither body could as effectively deal with the matter itself. He would therefore conclude by bringing the Electrical Trades' Benevolent Fund prominently to the notice of all present and solicit their support.

Mr. R. K. Gray supported Mr. Mordey's appeal. It was, he said, a matter for congratulation that in such a short period a sum of nearly £2,000 should have been collected. This showed the amount of work which had been done by the three gentlemen who were the trustees, as well as by others, and the result should have a good effect on the future success of their efforts. The object of the institution was surely one which would appeal to everyone. Was it not nice that those who had money to spare should come forward on occasions to help their unfortunate fellows? Many of them had already gone through business worries and troubles, and knew the value of human sympathy. He appealed to everyone present to do all they possibly could to make the institution, which had been so worthily inaugurated, a success.

Mr. J. H. Rosenthal (Messrs. Babcock & Wilcox) said that manufacturers to-day knew only too well that their workmen did not need their sympathy to any very great extent; they could fairly well take care of themselves. The masters, it was assumed, could also take care of themselves; but there was an enormous class in between the masters and the workmen who needed help, and it was precisely for this class, which could not avail itself of the ordinary methods of help, that the institution had been founded. He did not know much about the details of the management of the institution, but he felt certain from what he had heard that it filled a very real want, and he hoped that all would support it. Personally, he was quite ready to join in the movement.

Mr. G. Burney (Sterling Telephone & Electric Co.) proposed the toast of the Chairman, and in reply,

Mr. Mordey announced that there had been gathered in the room the sum of £220, so that the total funds available amounted to £2,591, made up as follows:—There had been collected by the end of 1908 the sum of £1,211; up to March 27th a further sum of £435 had been collected, and since then contributions amounting to £25 had come in. There had been collected in the room that evening the sum of £220, making actually in hand £1,891. In addition there were £350—perhaps more—to come from the Manchester Exhibition, and the *Dreadnought* which would come into their possession in 1911 was £350, making £2,591. The result of the dinner and the appeal connected with it had brought in £660. In thanking them for the toast, he expressed the hope that the dinner would become an annual affair. He thought, moreover, that the thanks of the industry were due to the work which had been, and was being, done by Mr. Justus Eck and Mr. W. Davenport in organising the institution.

MR. JUSTICE PARKER'S VIEWS ON THE NEW PATENT ACT

ON Friday, in the Chancery Division, Mr. Justice Parker delivered a judgment in an appeal from a decision of the Comptroller-General of Patents, revoking a patent under the revocation clause of the Patent Act of 1907. The patent in question is of no electrical interest, as it relates to the manufacture of stone slabs and tiles, but a considerable portion of his judgment in question was devoted to a discussion of what was considered to be the intention of the legislature in framing the Act, and some criticism was also made of the procedure under the revocation clause. This clause, it will be remembered, is as follows :—

(1) At any time not less than four years after the date of a patent, and not less than one year after the passing of this Act, any person may apply to the Comptroller for the revocation of the patent on the ground that the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom.

(2) The Comptroller shall consider the application, and if, after inquiry, he is satisfied that the allegations contained therein are correct, then, subject to the provision of this section, and unless the patentee proves that the patented article or process is manufactured or carried on to an adequate extent in the United Kingdom, or gives satisfactory reasons why the article or process is not so manufactured or carried on, the Comptroller may make an order revoking the patent, either

(*a*) forthwith, or

(*b*) after such reasonable interval as may be specified in the order, unless in the meantime it is shown to his satisfaction that the patented article or process is manufactured or carried on within the United Kingdom to an adequate extent.

Provided that no such order shall be made which is at variance with any treaty, convention, arrangement, or engagement with any foreign country or British possession.

(3) If within the time limited in the order the patented article or process is not manufactured or carried on within the United Kingdom to an adequate extent, but the patentee gives satisfactory reasons why it is not so manufactured or carried on, the comptroller may extend the period mentioned in the previous order for such period not exceeding twelve months as may be specified in the subsequent order.

(4) Any decision of the Comptroller under this section shall be subject to appeal to the Court, and on any such appeal the law officer or such other counsel as he may appoint shall be entitled to appear and be heard.

As Mr. Justice Parker is the first and, so far, the only judge to whom appeals from decisions by the Comptroller-General of Patents with regard to this section of the Act have been referred, the opinions which he expressed, applying as they do generally to all patents, are of considerable importance.

Mr. Justice Parker said that, in his opinion, the words "adequate" and "satisfactory" had been used by the legislature advisedly, leaving it to the discretion of the Comptroller-General of Patents, subject to an appeal to the Court, to place his own construction upon them in each particular instance, having regard to all the circumstances. Therefore, he did not propose to attempt to lay down a strict definition of these words. At the same time, there must be certain elementary principles applying in every case. For instance, patentees could not grant foreigners preferential terms to manufacture a patented article, without offering the same terms to British licensees and taking the necessary steps to develop the industry here, and expect this to be taken as a satisfactory reason for not manufacturing here. In his opinion, Section 27 was intended to penalise patentees who abused the monopoly rights granted to them by their patents, and, by revoking patents, to free this country from restraints on its trade which were contrary to its common law.

With regard to patents granted before the passing of the Act of 1907, he could not make any distinction between these and those granted subsequently, although the Comptroller and the Court might accept acts in connection with such patents as satisfactory reasons for not carrying on a process which might be rejected as unsatisfactory in the case of a patent granted subsequently to the Act of 1907. He totally dissented from the contention, however, that if a patentee by his own actions before the passing of the Act precluded himself from carrying on manufacture in this country, he should be exempt. Long before the passing of the present Patent Act, all patentees ran the risk of losing their patent rights at the hands of the Privy Council, although this process had fallen into disuse.

Dealing with the Patent Rules, Mr. Justice Parker somewhat amplified the opinions which he expressed in connection with the appeal against the revocation of the Bremer arc lamp patent, and which we reported in our issue for March 18th. In his opinion, it was wrong for the applicant not to be compelled to give evidence and satisfactory reasons for applying for the revocation of a patent. At present the patentee could be forced to disclose valuable information, the possession of which might be the precise object of the applicant, who, having obtained it, could withdraw his application for revocation. It allowed competitors, or intending competitors, to obtain particulars of the patentee's business which they otherwise could not obtain. Therefore, every applicant should be forced to give some *prima facie* evidence that his statement was correct. Reasonable protection should be given to patentees; even a common informer had to make out some case requiring an answer, and it was obviously wrong that an applicant for a revocation of a patent should be freed from this obligation.

Referring again to the Bremer case, Mr. Justice Parker stated he had come to the conclusion that both parties in an appeal must in future be compelled to rely upon the case which they placed before the Comptroller. In other words, he would not allow extra evidence to be called. He allowed this procedure in the Bremer case, owing to the fact that he himself had not fully considered this point, and felt that the patentees in that action might be in the same position.

LOCAL NOTES

ACTON: *Proposed Lease of Electrical Undertaking.*—The Metropolitan Electric Supply Co. have replied to the Council on the question of taking the lease of the municipal electrical undertaking (see ELECTRICAL ENGINEERING, March 18th). One of the main points in the dispute at the present time is the right of the Company to make their own terms with private consumers. The Council wish to bind the Company not to increase the present rates. The question of supplying electricity for supplying the Council's buildings is also the cause of some discussion, the Company offering to do this, should the transfer take place, at 4d. per unit, whereas the Council propose 2d. per unit. The matter has been deferred until a future meeting.

BRADFORD: *Proposed Central Tramway Shed.*—A scheme is under consideration for the construction of a central car shed by the tramways depot department, to take the place of the temporary erections which now exist on the outskirts of the city. The capacity of the proposed sheds would be 100 cars, and the estimated cost £25,000. The matter is to be further discussed before a decision is arrived at.

BRISTOL: *Libel Suit.*—Alderman George Pearson sued a local publication called the *Magpie* at the Bristol Assizes last week for damages for libel, and was awarded £30 and costs. The alleged libel was contained in some remarks in the publication in question concerning the electricity supply to the band-stand on Durdham Downs.

CARDIFF: *Tramway Track.*—The Tramways Committee have decided to engage Mr. Howard Smith, of London, to make an inspection of the tramway track at a fee of 50 guineas, including expenses. Among the applicants for this work was one, Mr. J. A. Brodie, City Engineer at Liverpool, who stated that his Corporation were prepared to allow him to undertake the work without a fee, but the Committee have decided not to accept this offer.

CHESHUNT: *Electric Lighting Order.*—The Board of Trade has revoked the electric lighting provisional order granted to the Council in 1906.

DUNDEE: *Ringing the Curfew by Electricity.*—The Sub-Committee of the Dundee Works Committee have decided that the curfew bell in the Old Steeple shall be rung night and morning by electricity. An electric motor costing £25 is to be installed, and the annual cost of working it is put at £3.

HASTINGS: *Charges for Electric Lighting.*—The Corporation have under consideration the question of increasing the charges of electric supply.

HYTHE: *The Tramway Question.*—The poll in connection with the question of opposing the National Electric Construction Co.'s Bill, which seeks powers to substitute the overhead system for a surface-contact system, on the tramways between Folkestone, Sandgate, and Hythe, has resulted in a majority in favour of opposing the Bill of 425.

HULL: *Proposed Tramway Extension.*—A deputation from the Stoneferry district waited upon the Corporation Tramways Committee last week to urge the extension of the tramways to Stoneferry. The proposition has been referred to the Tramways Sub-Committee.

LIVERPOOL: *First-class Tramcars.*—It is stated that the experiment of running first-class tramcars upon the Liverpool Corporation Tramways for the convenience of certain districts has proved unsuccessful.

LONDON: *L.C.C. and London United Tramways.*—The Highways Committee have now definitely reported with regard to the position of the London County Council concerning the

Digitized by Google

portion of the undertaking of the London United Tramways, Ltd., situated in the county. These lines, which are about 5½ road miles in length, and are worked on the overhead trolley system, are as follows:—From Hammersmith Broadway along King Street, Hammersmith, as far as Young's Corner, Goldhawk Road; from Hammersmith Broadway, via King Street, Studland Street, Glenthorne Road, Dalling Road, Paddenswick Road, Goldhawk Road, Askew Road, to the county boundary in Uxbridge Road; from Studland Road, via Gleneldon Road and Beadon Road, to Hammersmith Broadway; from Shepherd's Bush (Uxbridge Road Station), via Uxbridge Road, to the county boundary at Askew Road; from Shepherd's Bush via Goldhawk Road, to the county boundary in that road, and a short length of line, not regularly used, in The Grove, Hammersmith. After careful consideration, the Committee have come to the conclusion that it would be advisable for the Council to exercise its powers of purchase over these lines, and recommend that a notice in writing should be served upon the Company to this effect.

Tramways.—The Board of Trade arbitrator, who was appointed to determine a dispute between the County Council and the Hackney Borough Council with regard to the paving materials to be used in connection with the reconstruction of the tramways from Hackney Road, via Mare Street and Lower and Upper Clapton Roads to Stamford Hill, has issued his award. The effect of this is to require wood paving to be laid in certain portions, and granite paving in other portions.

In 1905 the Board of Trade consented to the use of trailer cars for the conveyance of stores and sand to and from the tramway depôts between the hours of 10 p.m. and 6 a.m., but did not give the Council the wider powers they asked for with regard to the use of passenger trailers. In a report upon this subject, the Highways Committee point out that trailer cars are extensively used on the Continent of Europe and in the United States of America, particularly in dealing with passenger traffic at the busiest hours of the morning and evening, and they feel that the use of trailers in this connection would be specially useful in London. At a recent conference the Commissioner of Police intimated that if the Council made application for permission to use trailer cars on its tramways, on the understanding that they would be used only for a limited time in the early morning and in the evening, he would be prepared to consider it. The Highways Committee think that such an application should now be made both by the Board of Trade and the Commissioner of Police. The trailer proposed would be a single deck car attached to another car, both cars having motors and being under effective control, and being operated as one car. The arrangement would be such that while the motors and magnetic brake gear of the leading car could be manually controlled in the ordinary way, those of the rear car could be controlled by electro-magnetically operated switches or contactors. It is, therefore, recommended that one pair of the necessary equipments for the coupling of two cars should be purchased for testing purposes, in the event of the Board of Trade giving the requisite consent to the use of trailers.

Electricity Testing Stations.—The Highways Committee recommend that notices should be served upon the Bermondsey, Fulham, Hackney, Poplar, and Southwark Metropolitan Borough Councils, and the South Metropolitan Electric Light & Power Co., Ltd., and the Westminster Electric Supply Corporation, Ltd., respectively, requiring them to (1) provide and maintain testing stations with proper and suitable instruments of a pattern to be approved by the Board of Trade; (2) to connect such stations by means of proper and efficient electric lines with the distributing mains of the undertakers; and (3) to supply energy thereto for the purpose of testing.

Bethnal Green: Supply in Bulk.—The Electricity Committee have had under consideration the references to them from the Council of the desirability of taking steps to secure a supply of energy for the Borough, and to obtain schemes for that purpose. They have instructed the Town Clerk to invite proposals from the several authorities and electrical undertakers authorised to supply within the Borough.

MAESTEG: *Electric Lighting Order.*—The Board of Trade has revoked the electric lighting provisional order granted to the Council in 1903.

MIDDLESEX: *The Tramways.*—The Light Railway Commissioners have submitted to the Board of Trade for confirmation an order granted by them extending the period limited by the County of Middlesex Light Railways (Lands) Order, 1905, The County of Middlesex Light Railways Order, 1903, and the County of Middlesex (Waltham Cross and Enfield) Light Railways Order, 1906, for the compulsory purchase of certain lands, and extending the period limited by the last-named order of 1903, for the completion of the light railways authorised by it, and extending the period limited by the order of 1906 for the completion of the light railways mentioned therein. Any objections may be made to the Assistant Secretary, Railway Dept., Board of Trade, before April 16th.

OXFORD: *The Tramways.*—It is stated that negotiations are proceeding between the Corporation and the National Electric Construction Co. to arrive at a compromise in the matter of the system of traction to be adopted. Sir Alexander Kennedy has advised the Corporation against the adoption of any surface contact system, and it remains, therefore, for the Corporation to take steps either to get the working of the system back into its own hands, or to agree with the Company for the adoption of a mixed system of overhead and conduit traction, which they have proposed. There seems, however, to be some difficulty in the matter of the rent to be paid by the Company.

PLYMOUTH: *Street Lighting.*—The Corporation have accepted the challenge of the local gas company for a demonstration of street lighting by gas and electricity.

RIO DE JANEIRO: *Tramways.*—It is announced that the Rio de Janeiro Tramway, Light & Power Co., Ltd., have acquired control of the Jardim Botanico Co.'s tramway system, which has hitherto been the only important independent tramway system in the City, and which operates an extensive service to the south-eastern district.

SMALLTHORN: *Electric Supply.*—The question of getting a supply of electricity from the Burslem Council is under consideration.

SOOTHILL NETHER: *Tramways.*—Notice is given of the intention of the Council to lease to the National Electric Construction Co., Ltd., the tramways authorised by its Act of 1904 for a period of 42 years; the Company to pay a yearly rental of £1,744 for the first 30 years; £284 per annum for the next 10 years, and £100 per annum for the remaining years of the lease. The transfer, of course, is subject to the approval of the Board of Trade.

SOUTHAMPTON: *Tramway Current Consumption.*—The manager of the tramway system has submitted a report on the increase of units used per car mile during the last year or two, which subject, he points out, is receiving the careful attention of tramway men all over the country. The chief reasons given for the increased consumption per car mile were careless driving, increased age, and consequent wear of track, cars, and equipment, and general increased speed of running on most tramways. In the Manager's opinion a likely cause of increase is that the iron cores of the field coils and armatures have aged from constant use. It was probable, however, that the chief factor of increase was careless handling by motor men. In conclusion, the Manager drew attention to a controller regulator which made it impossible to rush the controller handle round too quickly. The cost of installing this would be about £4 10s. per car. A list of a large number of towns is given in the report, showing decreases and increases in current consumption per car mile during the past year.

SWANSEA: *Proposed Purchase of Electricity Works.*—With reference to the offer of a syndicate to purchase the Municipal Electricity Works, it is now stated that the intention, if the proposition is carried through, is to erect a new power-station at the Docks, and utilise the waste heat from neighbouring works.

SWINDON: *Tramways Loss.*—It is estimated that the loss upon the tramways undertaking for the current financial year will be £4,000.

TAVISTOCK: *Electric Lighting Order.*—The Board of Trade has revoked the electric lighting provisional order granted to the Council in 1904.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—Tenders are invited for the supply, delivery, and erection of a circulating pump, together with motor and pipes for the pump house, Laganbank Road. (See advertisement this week.)

BLACKPOOL.—Tenders are invited for extra high-tension and low-tension cables during the next twelve months. Particulars from Mr. C. Furness, Borough Electrical and Tramways Engineer.

BRIGHTON.—At the last meeting of the Corporation, the report of the Borough Electrical Engineer, Mr. John Christie, as to the necessity for providing new plant for future extensions (full particulars of which were given in our issue for March 18th), was adopted.

EDINBURGH.—Tenders are invited for underground cable conduits. (See advertisement this week.)

GLASGOW.—Tenders are invited for the supply, during the year ending June 1st, 1910, of cables, electricity meters, and arc lamp carbons. (See advertisement this week.)

HASTINGS.—At the Local Government Board inquiry last week into an application by the Corporation for sanction to borrow £5,000 for the purposes of the electricity undertaking, the Hastings & St. Leonards Gas Co. opposed. The company complained that every year the rates were increasing to make up the deficiency on the electricity account.

LONDON: *Hammersmith.*—Tenders are to be invited for supplying and fixing new panels on the main switchboard.

LOWESTOFT.—A Local Government Board inquiry was held

Digitized by Google

last week into an application by the Corporation for sanction to borrow £2,000 for house services. There was no opposition.

MEXICO.—The *Board of Trade Journal* states that some Canadian capitalists intend to erect an electric power plant on the Rio Conchas, a short distance from the town of Parral, at a cost of about £500,000. The initial capacity of the proposed plant will be about 15,000 h.p., and the power generated will be used for mining and irrigation purposes.

WALSALL.—Extensions to the generating plant in connection with the supply to Bloxwich are contemplated, at an estimated expenditure of £30,000. An application is to be made to the Local Government Board for sanction to borrow this amount.

Miscellaneous

ITALY.—With reference to the call for tenders for the supply of electric lamps, &c., to the Italian Royal Arsenals, H.M. Consul at Rome (Mr. C. C. Morgan) reports, says the *Board of Trade Journal*, that the Italian Ministry of Marine have postponed the date fixed for the receipt of tenders. Further particulars may be obtained on application (preferably in Italian or French) to "Sua Eccellenza il Ministro della Marina, Via dei Portoghesi," Rome.

LARNE (IRELAND).—Tenders are invited for public lighting by gas or electricity for three years from April 1st next. Particulars from the Clerk, and tenders by April 19th.

LONDON: *London County Council.*—The Highways Committee have reported with regard to the construction of tramways on the conduit system from the "Plough," Clapham, *via* Clapham Common, North Side, and Cedars Road to Lavender Hill, at an estimated cost of £25,630, and recommend that the work be carried out. The details are as follows:—Track-work, exclusive of rails, £21,550; provision of sewer, alterations to footways and convenience, £3,400; cables, ducts, &c., £640; and sub-station equipment, £40.

WARRINGTON.—Tenders are invited for steel tramway poles for overhead gear. Particulars from the Borough Electrical Engineer and Tramways Manager, and tenders by April 7th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

LONDON: E.—Additions, Farrance St. School, Limehouse (£980). Architect, T. J. Bailey, L.C.C. Education Committee, Victoria Embankment, E.C.

Manual training centre, Poplar (£1,683). Builder, E. Lawrance & Son, Wharf Road, City Road, E.C.

N.W.—Rebuilding Mill Hill Grammar School, Hendon, after fire, for the Governors.

S.E.—Roman Catholic Church, High Road, Lewisham. Architects, Kelly & Dickie, Oxford St., W.

S.W.—Reconstruction of boiler-house at South-Western Hospital, Stockwell (£2,300). W. T. Hatch, Chief Engineer, Metropolitan Asylums Board, Victoria Embankment.

Additional block, Isolation Hospital, Barnes (£3,000). Architect, G. B. Tomes, Council Offices, Barnes.

The Wandsworth Council are to invite fresh tenders for the alterations to the electrical installation at the Putney library. A tender was recently accepted, but the contractor has withdrawn his tender.

W.—Electric theatre on site of 225 Oxford St. and 2-10 Hills Place. Architect, Melville S. Ward, 100 Victoria St., S.W.

Adaptation of 333 Oxford St. for Old Oak Tea House, 37 Old Bond St. Builders, Whitby Bros., Featherstone Buildings, Holborn.

Twenty-six shops, Piccadilly Arcade. Builder, F. Bush, Ridgmount St., W.C.

PROVINCES.

ALTRINCHAM.—County High School for Girls (£9,850). Architects, Sankey & Cubbon, 4 Chapel Walks, Manchester.

BANGOR.—Technical school and free library (£2,625). Architect, E. L. Woods, 97 Main St., Bangor.

Technical school. Architect, E. Wood, Bangor. Builders, Dowling & Son, Cromwell Rd., Belfast.

BATLEY.—Church (£6,000). Architects, Hoare & Wheeler, 11 Orchard Street, London, W.

BIRKENHEAD.—Swimming baths (£18,000). C. Brownridge, Borough Engineer, Town Hall, Birkenhead.

BOGNOR.—Pavilion (1,000 places). E. A. Bridges, Bognor.

BRENTFORD.—Additions and alterations to Town Hall. Nowell Parr, Architect, Town Hall.

BRIDGEND.—Offices for Guardians. P. Thomas, Bridgend.

BURNLEY.—Skating rink, Church Street. S. Taylor, Manchester Rd., Burnley.

BURTON-ON-TRENT.—Police station (£13,000). Architect, J. S. Lyran, Burton-on-Trent.

BUXTON.—Enlarging mineral-water baths. W. H. Greeves, Buxton.

CLECKHEATON.—Secondary and technical school. Architect, W. H. Thorp, Phœnix Chambers, South Parade, Leeds.

DARLINGTON.—Higher grade school (£5,800). M. Winton, Town Hall, Darlington.

DUBLIN.—School, Denmark St. (£11,000). Architects, Asterley & Coleman, Dublin.

FALMOUTH.—High school for girls. Architect, S. Hill, Redruth.

GATESHEAD.—Church school (£6,000). Marshall & Tweedy, Newcastle-on-Tyne.

GLASGOW.—Church Patrick (£5,000). Architect, G. Simpson, 233 St. Vincent St., Glasgow.

HUDDERSFIELD.—Bank premises. Architect, J. Berry, Market Place, Huddersfield. Builder, E. Jowett, Huddersfield.

LIVERPOOL.—Warehouse (£12,000). Architects, Walker & Strong, Dull St., Liverpool.

MAIDSTONE.—School (£13,339). Architect, T. F. Bunting, Borough Surveyor, Fair Meadow, Maidstone.

PAISLEY, N.B.—Additions to County Buildings (£7,000). J. Murray, County Hall, Paisley, N.B.

SALFORD.—Church. Architect, H. Cunliffe, 2 John Dalton St., Manchester.

SHEERNESS.—Higher elementary school (£6,393). W. H. Robinson, Architect to Kent Education Committee.

STOCKPORT.—Primitive Methodist Church and Schools (£1,748). Architects, Wrathmell & Blakeshaw, Queen's Buildings, St. Peter's Square, Stockport.

STOCKTON-ON-TEES.—Catholic school (£3,000). A. Harrison, Stockton-on-Tees.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—The Victorian Postmaster-General's department has accepted the tender of the British Insulated & Helsby Cables, Ltd., of £396 7s. 6d., for one mile of telephone switchboard cable, silk and cotton insulated, and light lead covered. The following tenders have been accepted by the Queensland Postmaster-General's Department:—British Insulated & Helsby Cables, Ltd., Melbourne—220 yards cable, lead covered, 13 pairs, at £71 per mile; 770 yards cable, lead covered, 26 pairs, at £110 per mile; 380 yards cable, lead covered, 39 pairs, at £142 per mile. W. T. Henley's Telegraph Works Co., Ltd., Melbourne—2,750 yards cable, lead covered, 52 pairs, at £169 per mile; 3,740 yards cable, lead covered, 104 pairs, at £274 per mile; 1,760 yards cable, rubber insulated, 13 pairs, at £242 per mile. Western Electric Co. (R. B. Hungerford, representative, Sydney)—990 yards cable, lead covered, 78 pairs, £125; 2,200 yards cable, lead covered, 208 pairs, at £622.

AUSTRALIA.—*Commercial Intelligence* states that the Victorian Board of Land and Works has entered into a contract with the Bulla Shire Council for the supply of electric light and power to the Sunbury Asylum. The number of lights will be 1,300, and separate motors for laundry and other work will be installed.

GLASGOW.—The Corporation have accepted the offer of The Lorain Steel Co. for special trackwork, spare points, steel rails, and fish-plates. During a discussion on the matter at the last meeting, Mr. James MacFarlane, the convener of the Tramways Committee, said that whereas the offer of The Lorain Steel Co. for special trackwork was £923, the lowest British tender was £1,136. In the case of spare points, the figures respectively were £1,067 and £1,034, whilst with regard to rails and fish-plates the difference was very much greater. The Lorain Co. offered fish-plates at £6 2s. per ton, delivery in Glasgow Harbour, and the lowest tender from a British firm was £9 12s. 6d., and a German firm, £12. A leading English firm had offered to do the work at £12 10s. per ton. These differences were so very great that he thought there must be something wrong, as it was not a case of dumping, but practically special work in every case.

DARLINGTON.—The Corporation have received sixteen tenders for an exhaust steam turbine, the highest of which, curiously enough, is from a German firm. Mr. J. R. P. Lunn, the Borough Electrical Engineer, is to report upon the tenders.

FAREHAM.—The Council have accepted the following tenders in connection with the Electricity Works: Roof construction ironwork, Messrs. Brownlie, Murray & Co.; roof lights, Messrs. Hope & Co.; ventilators, Messrs. Helliwell & Co.

HESTON AND ISLEWORTH.—The Council have accepted the following tenders for annual supplies for the electricity undertaking: W. T. Henley's Telegraphic Works Co., Ltd., cables, disconnecting boxes, and bridges; Lucy & Co., service boxes; British Insulated & Helsby Cable Co., fuse boxes; British Electrical Trade Supply, pitch compound; Doulton & Co., earthenware troughs; Sutton & Co., burnt tiles; Mordey-Fricker Electricity Meter Co., slot meters; Siemens Bros. and Venner & Co., meters; General Electric Co., copper wire; Sloan Electrical Co., carbons, &c.; Alex Duckham & Co., Ltd., and Frank Cox, oils.

LONDON: *London County Council.*—An offer by Messrs. Hadfield's Steel Foundry Co., Ltd., to supply special trackwork for the construction of a junction line between Borough High Street and Marshalsea Road has been accepted at £2,162.

The tenders of The British Westinghouse Electric & Manufacturing Co., and Messrs. Dick, Kerr & Co., have been

Digitized by Google

accepted for the supply of controllers and controller parts, and circuit-breakers and canopy switches

The tender of Messrs. W. T. Henley's Telegraph Works Co. has been accepted at £97 for the renewal of feeder cables for Rotherhithe Tunnel.

Metropolitan Asylums Board.—The tender of Messrs. Tilley Bros., of 53 Kingsland Road, N.E., for electric wiring at the North-Eastern Hospital, at £5,064, has been accepted. This was the lowest tender. The Board's Engineer's estimate was £5,200.

Hammersmith.—The Council has received the following tenders for the supply of four automatic no-load and overload release switches for the fans in connection with the Plenum system of ventilation in the town hall: A. Reyrolle & Co., Ltd., £2 13s. each; Bray, Markham & Reiss, Ltd., £3 17s. 6d. each; Langdon Davies Motor Co., Ltd. (accepted), £4 7s. each; Ferranti, Ltd., £4 14s. 6d.; Adams Manufacturing Co., Ltd., £5 18s.; Matthews & Yates, Ltd., £8 17s. 7d.

The Council received the following tenders for the supply of 30 lamp columns required in connection with the conversion from gas to electricity of the public lamps in Latimer Road, North Pole Road, and Hythe Road: F. Bird & Co., £1 4s. 6d. each; Beldam Foundry, £1 5s. 6d.; Cadogan Ironworks, Ltd. (accepted), £1 6s. 6d.; J. Bartle & Co., £2 3s.

Westminster.—The City Council has received the following tenders for wiring and providing two arc lamps in the swimming baths at Buckingham Palace Road: Belsham & Co., £54 10s.; Drake & Gorham, £49 16s.; Leo Sunderland & Co., (accepted), £39 10s.; Westminster Engineering Co. (not complete), £39.

Woolwich.—The Council have accepted the following tenders: —W. T. Henley's Telegraph Works, Ltd., at £88 10s., for 500 yards 4-core 0·05 L.T. cable, and £27 5s. for 200 yards 4-core 0·035 L.T. cable; John Spencer, Ltd., £167 10s. 5d., for constructing a cooling pond at the Plumstead Electricity Works; and Willans & Robinson, Ltd., at £66 12s., less 10 per cent., for the supply of six sets of valve lines for the two 195-kw. machines at the Plumstead Works.

NEW ZEALAND.—It is stated that the Auckland Harbour Board has decided to accept the tender of a British firm for the supply of 12 electric cranes, in spite of the fact that it was £501 higher than that of a German firm.

NEWBURY.—Messrs. Plenty & Sons, Ltd., have placed an order with the D. P. Battery Company, Ltd., of Bakewell, for a large renewal battery at Benham Park, Newbury. This plant is to take the place of a D. P. battery which has been in continuous use for over ten years.

COMPANIES' MEETINGS AND REPORTS

MELTON MOWBRAY ELECTRIC LIGHT CO.—At the annual meeting last week, the report and accounts were adopted. The number of 8-c.p. lamps connected during the year has increased from 17,528 to 18,015. The revenue for the year, including a small balance brought forward, amounted to £1,881, and after meeting debenture interest, &c., there is a balance of £844 available for depreciation. A dividend of 2 per cent. absorbs £400; the sum of £400 is to be placed to renewals account, and the balance of £44 carried forward.

ELEKTRIZITATS-GES. ALIOTH, BASLE.—The report for the past year states that 4,235 dynamos and motors, with a total capacity of 130,500 h.p., and 1,913 transformers, representing 90,900 k.v.a., were delivered during the year. The firm will make a speciality of high-speed alternating-current motors for centrifugal pumps this year. The gross profit for the past year amounts to 1,073,729 francs; after allowing for reserve fund and depreciation, a dividend of 6 per cent. has been paid, and 49,555 francs has been carried forward.

VICKERS, SONS & MAXIM.—The directors report that the profits of 1908 show a falling off from those of 1907, due to the depression of trade throughout the world, which the company experienced in common with other industrial undertakings. The directors recommend the payment of a final dividend at the rate of 5 per cent., making a total dividend of 10 per cent. for the year, carrying forward a sum of £186,672. After providing debenture interest and the usual depreciations, &c., the profits of the year were £416,845, which, with the sum brought forward from 1907, amounts to £627,922. After deducting the interim dividends paid in August last, there remains a disposable balance of £407,297, and the directors recommend a dividend of 2½ per cent. on the preferred 5 per cent. stock and 5 per cent. preference shares (less income tax), and 1s. per share (free of income tax) on the 3,700,000 ordinary shares, making with the interim dividend 10 per cent. for the year. At the meeting on Tuesday, the report and accounts were adopted.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO.—The report for 1908 shows gross profits of £1,988. The reduction in profits compared with the previous year is due to the increased cost of coal and the smaller number of lighting units sold, although the total output exceeds that of 1907. The whole of the surplus has been transferred to reserve and depreciation account, which now stands at £20,386.

At the meeting last week, the report and accounts were adopted.

GATESHEAD & DISTRICT TRAMWAYS.—The report for 1908 shows a net profit of £24,699 after meeting mortgage interest. The sum of £2,792 is to be applied to the renewal of permanent way; £3,000 is to be added to depreciation and reserve account; and £1,799 to sinking fund for redemption of mortgage. After meeting the preference dividend and a dividend on the ordinary shares of 7 per cent. for the year, the sum of £922 is carried forward.

At the meeting last week, the report and accounts were adopted. Mr. C. R. Greene, the chairman, stated that, having regard to strikes and the lock-out experienced throughout the year on the north-east coast, the result of the year's working must be considered very satisfactory. An agreement, he said, had been entered into with the Gateshead Corporation, deferring the latter's power of purchase under the Tramways Act from 1922 until 1930, and, in consideration of this, the company was to extend the Benshaw route and double the Low Fell Road. The Bill before Parliament this session confirmed this agreement.

SOUTH WALES ELECTRICAL POWER DISTRIBUTION CO.—The report for 1908 states that the sale of the Neath and Bridgend Stations to the respective District Councils, referred to in the last report, has been duly completed. After very protracted negotiations, the endeavour to form a consumers' company to work the Cwmbran area on the lines of the Treforest Electrical Consumers' Co., Ltd., failed. Arrangements have, however, been completed, whereby the Treforest Company will take over and supply the Cwmbran area from the Treforest generating station, by means of a connecting cable between the two areas. A portion of the proceeds of the sale of the Neath and Bridgend stations is being utilised for the construction of this cable, which will shortly be completed, thus enabling the Cwmbran station to be shut down, or only used as a stand-by. This arrangement has the advantage of not only increasing the load on the Treforest generating station, but will also save the costs of working of the Cwmbran station. The agreement between this company and the Treforest Company embodying the foregoing arrangement has received the sanction of the Board of Trade, and of Mr. Stanley Boulter, the debenture agent, on behalf of the debenture stock holders of the company. The Treforest Electrical Consumers' Co., Ltd., have practically completed the installation of the new plant, referred to in the last report, at the Treforest generating station, and it has been in operation since October last. The cost of production has thereby been materially reduced, and it is anticipated a still further reduction will be effected. The meeting is on April 6th.

HARROW ELECTRIC LIGHT & POWER CO.—The report for 1908 shows a balance, after meeting debenture interest and interim dividend on the preference shares, of £2,443, and the directors recommend the final dividend on the preference shares, and the dividend of 5 per cent. per annum on the ordinary shares, carrying forward £401. The number of units sold during the year was 400,402, against 378,533 in the previous year.

BOURNEMOUTH & POOLE ELECTRICITY SUPPLY CO.—At the annual general meeting last week, the report and accounts, given in our issue for March 11th, were adopted. Dr. J. Atkinson Hosker, who presided, stated that the output during the year had increased by 5 per cent., but the price obtained per unit had increased from 3·928d. to 3·839d., owing to more energy having been supplied for heating and cooking. Their sales in connection with heating and cooking apparatus during the year had amounted to nearly £3,000, with a profit of over £600.

FOLKESTONE ELECTRIC SUPPLY CO.—The report for 1908 shows total receipts amounting to £12,900. After adding £332 brought forward from last account, and providing for interest on debenture stock, dividend on preference shares, &c., and an interim dividend of 4 per cent. upon the ordinary shares, there is a balance of £6,528. The sum of £3,000 has been transferred to depreciation fund, and £450 to reserve fund. In addition, a dividend at the rate of 7 per cent. per annum, less income tax, for the half-year, making 5½ per cent. for the year, is recommended upon the ordinary shares, carrying forward £328. A further issue of 4½ per cent. debenture stock will shortly be made.

BUENOS AYRES GRAND NATIONAL TRAMWAYS CO.—At an extraordinary general meeting last week a resolution that the company be wound up voluntarily was passed.

WOKING ELECTRIC SUPPLY CO.—The accounts for 1908 show a balance available of £7,831, and after meeting debenture interest and dividends of preference shares, &c., and transferring £1,500 to depreciation fund, a dividend of 5 per cent. is recommended upon the ordinary shares, carrying forward £706. The meeting is on Saturday.

BROMLEY (KENT) ELECTRIC LIGHT & POWER CO.—The report and accounts for the year 1908 show a profit of £12,562, and after meeting debenture interests there is a balance of £9,360. The directors recommend a dividend for the second half of the year at the rate of 7 per cent. per annum, making 5½ per cent. for the year, and that £2,338 be transferred to renewals reserve fund and £2,600 to general reserve account, carrying forward £296. The meeting is on Monday.

ELECTRICAL DISTRIBUTION OF YORKSHIRE.—The annual general meeting was held at Leeds last week. The

Digitized by Google

chairman, Mr. A. G. Lupton, stated that the company during the year had completed the transfer of the Ossett Electric Lighting Order, and the sub-station had been built and a supply given. The next balance sheet will include a full year's revenue from the Ossett and Toothill Nether tramways, and also from a considerable number of undertakings which were only connected during the latter part of last year.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.—At the annual meeting on Thursday, the report and accounts given in our issue for March 11th were adopted. Dr. J. T. Merz, the chairman of the company, who presided, spoke at some length upon the position of the company. There had been rumours, he said, that something had gone wrong in connection with the Dunston power station, but the work of construction was progressing satisfactorily, and it was hoped that the station would be in operation at the beginning of next year. Criticism had also been made in connection with the last issue of shares, in that it had been made at a time when trade in the north-eastern district was bad. The fact was, however, that the company could not postpone making financial arrangements because they were largely in debt. If they had not done what they did, they could not have gone on. As it was, the bank took over the whole of the issue, and all the shares were taken up by the public, the bank getting a premium, after paying expenses, of something like £10,000. For the twelve weeks from Jan. 1st this year, the chairman stated, the company was £8,000 better off than they were this time last year, and if they went on at the same rate for the remainder of the year, it was calculated that there would be a net profit of £102,000. Mr. J. H. Armstrong, in seconding the resolution for adopting the accounts, said there was a feeling of doubt in the minds of many shareholders as to whether their interests were being properly protected. The main point was in connection with depreciation, and he thought they would be satisfied on this head because last year no less than £37,000 were expended upon maintenance, repairs, and renewals, and as ordinary maintenance would only have cost £13,366, the balance represented renewals for the upkeep of the plant and system. The directors preferred to charge this expenditure against revenue, instead of to a depreciation fund. The directors proposed to carry out this policy in the future, and to build up a reserve fund from time to time. Lord Joicey having expressed his confidence in the present Board, the report and accounts were adopted.

AIRDRIE & COATBRIDGE TRAMWAYS CO.—The total revenue for the year 1908 amounted to £11,808, and the expenditure, including £800 upon permanent way renewals, to £10,054. Adding the amount brought forward, there is an available balance of £2,532, and after carrying forward £200 to loan redemption fund and £250 to general depreciation, a dividend of 4 per cent. per annum is recommended upon the ordinary shares, carrying forward £282.

ANGLO-ARGENTINE TRAMWAYS CO.—The accounts for 1908 show a sum available for dividend of £490,888. After meeting interest upon the numerous classes of debentures and preference shares, a dividend at the rate of 6½ per cent. per annum is recommended on the ordinary shares, carrying forward £12,839.

RIVER PLATE ELECTRICITY CO.—The accounts for 1908 show a balance available of £27,223, and the directors recommend a dividend of 8 per cent. per annum upon the ordinary shares. The sum of £6,000 is added to general reserve and £5,623 are carried forward. The report states that additional plant will be necessary to meet the expansion of the business, and it is proposed to increase the preference capital by £50,000.

MADRAS ELECTRIC TRAMWAYS CO.—The gross profits for 1908 amount to £11,545. After meeting interest and debenture stock, sinking fund, and transferring £2,750 to depreciation and renewals, a dividend of 4½ per cent. per annum is recommended on the preferred ordinary shares, and 1 per cent. upon the deferred ordinary shares. The sum of £291 is carried forward.

WINCHESTER ELECTRIC LIGHT & POWER CO.—At the recent meeting the report and accounts were adopted. The net profits for 1908 amounted to £7,330, and a dividend of 6 per cent. for the year has been declared upon the ordinary shares, placing £1,500 to depreciation.

LLANDUDNO & DISTRICT ELECTRIC CONSTRUCTION CO.—At the annual meeting on Monday, the report and accounts were adopted. Mr. Stephen Sellon, who presided, stated that the complete line from Llandudno to Colwyn Bay was not available for traffic until June last year, but the first six months of the completed line showed a substantial profit.

BRITISH ALUMINIUM CO.—A meeting of the debenture holders was held in London on Monday, when resolutions were submitted for the creation of £100,000 further debenture stock. Owing to the absence of a quorum, the meeting was adjourned.

Wireless Telegraphy.—The Governor of Jamaica has granted a licence to the Direct West India Cable Company, Ltd., to erect a wireless telegraph coast station. This station should be of great service to the fruit steamers, of which many call at Jamaica.—A site has been selected for the wireless telegraphy Station of the West India and Panama Telegraph Company at Trinidad. The pole to be erected is 225 ft. high, and is in three sections.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net, c.i.f., port of arrival, quoted on Tuesday night, was £58 15s. to £59 5s. (last week, £58 5s. to £58 15s.).

CAROLINA PORT GENERATING STATION, DUNDEE.—Messrs. L. G. Mouchel & Partners, Ltd., of 38 Victoria Street, London, S.W., write us that having received information that reports are in circulation to the effect that the work for the above foundations is being carried out on the Hennebique system, they wish to state that this is not the fact. Neither Mr. Hennebique nor themselves, as his sole agents, have anything whatever to do with it; it is not carried out upon the Hennebique system, and the plans have not been designed or approved by them or by anyone on their behalf.

CHANGE OF ADDRESS.—The London office of Messrs. Morris Hawkins, Ltd., has been removed to 30 St. Mary Axe, E.C., larger premises having been necessary owing to increased business.

The Warner Engineering Co., Ltd., have removed from Dartmouth Street, Westminster, to 5 Carteret Street, Westminster, London, S.W.

Messrs. Anderson & Munro, Electrical Engineers, of 63 Queen Street, Edinburgh, have removed to 11 Randolph Place, Edinburgh, where they have secured more central and suitable premises.

Messrs. Richardsons, Westgarth & Co. have removed from 5 Queen Anne's Gate to 17 Victoria Street, Westminster, S.W. Their telephone number will remain the same, Victoria 3374.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A meeting of the London Electric Wire Co., Ltd., will be held on April 27th, at 7 Playhouse Yard, Golden Lane, London, E.C., at 3 p.m., to hear the liquidator's account of the winding up.

The discharge of C. H. Vere, Electrical Engineer, 5 Park Parade, North Finchley, has been suspended for three years, as from February 23rd.

DIRECT UNITED STATES CABLE CO.—An interim dividend of 4s. per share, free of tax, has been declared for the March quarter.

Inferior Metal Filament Lamps.—The following notice has been sent to the daily Press by Mr. C. Newton Russell, Chief Electrical Engineer to the Shoreditch Borough Council, and President of the Associated Municipal Electrical Engineers (Greater London) :—"It has come to the notice of the Associated Municipal Electrical Engineers (Greater London) that lamps reported to be metallic filament lamps of the best quality are being offered for sale to shopkeepers and others by unscrupulous dealers at high prices, such lamps being of inferior manufacture and totally unsuitable for the purpose for which they are sold. Electric light users are warned against purchasing lamps that do not bear the maker's name, and are sold by unknown dealers, as purchasing lamps in the manner indicated can only result in disappointment and higher electric light bills. Users are strongly recommended to avail themselves of the advice (which will be freely given without cost to the consumer) of the chief electrical engineer of the supply authority of the district from which they obtain their supply."

Steam Turbo-Generators.—On Monday, March 22nd, Mr. G. G. Stoney delivered the first of the series of Cantor lectures before the Royal Society of Arts on "Steam Turbines," and the second of the series was delivered on Monday of this week. The first lecture was devoted to a history of the development of the steam turbine, and a description of the various types now in existence. In the second, the lecturer first described the action of the Parsons' vacuum augmentor and the principles of the exhaust and the mixed pressure turbines, and then passed on to the applications of the steam turbine. After tracing the growth in the size of turbo-dynamos from the earliest Parsons machines to the 6,000 kw. turbo-alternators for Sydney, which weigh approximately 180 tons each, Mr. Stoney stated that whereas continuous-current turbo-generators could not be constructed for larger outputs than about 2,000 kw. or 4,000 kw. for a tandem set, there was no such limit to the size of turbo-alternators. The largest that had been built was a 10,000-kw. machine, but machines of 20,000-kw. capacity had been designed, and even larger ones could be built if necessary. The lecturer then explained and demonstrated with the aid of a model motor-generator set the action of the Parsons and Law device for compounding alternators by providing a leakage path in the exciter field system. This method was fully described in Electrical Engineering, Vol. III., p. 546. A large number of slides illustrating the methods of winding the stators and rotors of turbo-generators were shown. Attention was drawn to the means of holding the windings rigid. Engineers had, Mr. Stoney said, only lately realised the enormous forces that came into play in the case of a short-circuit, which were especially severe in the case of several machines running in parallel. The question as to whether salient poles or distributed windings were most suitable for the rotors of turbo-alternators was still, the lecturer stated, a debatable one.

SUMMARY

200-volt 32- and 50-c.p. tantalum lamps will be placed on the market next Tuesday. We publish a full-size drawing of the lamp and various particulars. (Page 321.)

A new Institution of Colliery and Mining Electrical Engineers is to be formed. A preliminary meeting will be held in Manchester on April 24th. (Page 321.)

Mr. C. W. Mallins, General Manager of the Liverpool Corporation Tramways, has designed an indicator which gives a signal to the driver of a tramcar when a passenger attempts to board or alight from the car. (Page 322.)

The House of Lords has delivered judgment in the action of the Postmaster-General against the National Telephone Co. with regard to the payment of royalties upon private telephone lines. The Court of Appeal had decided in favour of the company, but the House of Lords have now reversed this decision. (Page 322.)

The London County Council have decided to abandon the use of the G.B. surface-contact system in the Mile End Road. The Highways Committee give their reasons for this in a long report, which was adopted by the Council at about 4.30 on Wednesday morning, towards the close of an all-night sitting. In the course of the discussion, Mr. Whittaker Thompson, who was Chairman of the Highways Committee at the time the adoption of the G.B. system was decided upon, expressed the opinion that the surface-contact system was the system of the future, and that the G.B. system had been done to death by slanderous doings. (Page 323.)

After an inquiry extending over ten days, it has been concluded that the West Stanley colliery disaster was caused by an ignition of coal dust, but the cause of the ignition of the dust has not been ascertained. The evidence has brought out the importance of keeping all terminals clean and protecting them from dust, the necessity of fuses and switches being absolutely gas-tight, and the desirability of using circuit switches with tripping coils whenever possible for fiery mines. (Page 324.)

The Board of Trade report, by Col. Druitt and Mr. A. P. Trotter, on the collision and fire last January on the electrically-worked portion of the Lancashire

Digitized by Google

and Yorkshire Railway, has now been issued. The collision was due to a signalman's neglect of rules, and the damage to the main cables in the driver's cabin of one of the trains caused an arc, which set the surrounding woodwork on fire. Mr. Trotter recommends that the motor compartments of the cars should be rendered more fireproof. (Page 325.)

Mr. F. B. O. Hawes has been appointed secretary of the National Electrical Manufacturers' Association, in succession to Mr. W. Davenport, who has resigned. The offices of the Association have been removed to Balfour House, Finsbury Pavement, London. At the annual meeting of the Association recently, it was announced that the members of the Association who had exhibited at the Manchester Exhibition had received a preferential discount on rent of space which had averaged more than their yearly subscription to the Association, in addition to the further return which had been made to the exhibitors. (Page 326.)

A prospectus has been issued by the Victoria Falls and Transvaal Power Co. for 900,000 six per cent. £1 cumulative preference shares at par. We reproduce a letter from the *Times*, in which it is pointed out that although the capital of the company is being sought in Great Britain, all the generating plant now running has been purchased from Germany. (Page 326.)

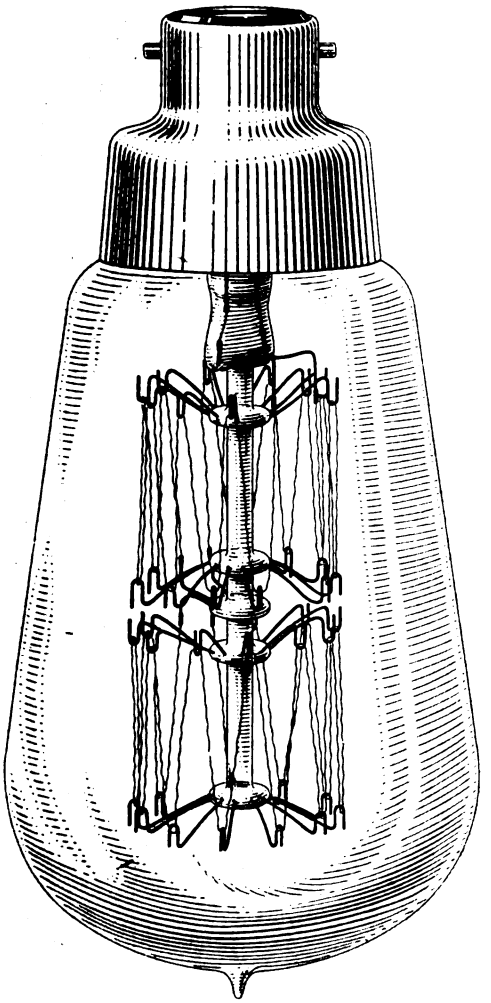
Mr. Schenk has again offered to negotiate with the Bath Corporation for the purchase of the Electricity Works.—The Belfast Corporation have rejected the proposed agreement with the Cavehill and Whitewell Tramways Co. for mutual running powers.—Differences of opinion have arisen between the Dundee Corporation Engineer and the contractors for the new power station, and the arbitrator provided for under the contract is to be called in.—The Engineer to the Edinburgh Corporation has presented a report in which he recommends the installation of the trackless trolley system upon a five-mile route.—Owing to decreasing revenue, the Hastings Corporation has increased its electric supply charges. (Page 327.)

Extensions to electricity works are contemplated as follows:—Bath, £11,699; Beckenham, £2,800; Dudley, £6,000; Leyton, £1,750; and Salford, £2,200.—The London County Council will shortly invite tenders for 200 double-deck tramcars. (Page 328.)

A dividend of 5 per cent. is recommended upon the ordinary shares of the North Metropolitan Electric Power Supply Co., and a 4 per cent. dividend upon the ordinary shares of the Metropolitan Electric Tramways. The report of the Lancashire Dynamo & Motor Co. shows a net profit of £11,742. (Page 330.)

In the resumed discussion on Mr. J. H. Rider's Paper on the electrical system of the L.C.C. tramways, reference was made to the coal specification, which we publish in full this week. Mr. Roger Smith contended that there was no advantage in placing the site on the river, saying that he obtained as good results at the Great Western Railway power station at Park Royal with rail-borne coal and cooling towers. Mr. C. P. Sparks congratulated the L.C.C. on having employed British-made plant throughout. Mr. Sparks also remarked that 94 r.p.m. was a high speed for Corliss valve gear, and, contrary to Mr. Frank Bailey's opinion, thought that the steam turbines would outlive the reciprocating engines. Several speakers alluded to the troubles experienced with reverse current relays. Mr. G. W. Partridge criticised the use of three-phase motors for the circulating water pumps. Mr. Ferranti, Mr. Robert Hammond, Mr. E. L. O'Brien (Lancashire and Yorkshire Railway), Mr. H. W. Clothier, and Mr. J. F. C. Snell also spoke. (Page 333.)

A new system of house-wiring is described, with which it is claimed that good work can be executed at 10s. per point. (Page 337.)



A form of construction for the field systems of high-speed continuous-current dynamos, with which a wide commutating zone is obtained, is described in a patent specification by the British Thomson-Houston Co. and F. H. Clough. Among the other specifications published on Thursday was one by W. D. Coolidge for a method of simultaneously sintering a number of metal filaments connected in parallel. Opposition has been entered to the granting of patents to F. J. Planchon for a process for the preparation of metal filaments, and to H. Aron and A. Geiger for a method of decarbonising metal filaments. A patent by C. Kellner for electrolytic apparatus with mercury cathodes and separate forming and decomposing cells expires during the current week after a life of fourteen years. (Page 338.)

Towards the close of an all-night sitting, the London County Council decided, between 3.30 and 4.30 yesterday morning, to abandon the G.B. surface-contact tramway system in the Mile End Road. In spite of the late hour, the discussion upon the report recommending the abandonment of the experiment was a spirited one, and our own reporter (who was the only member of the technical Press present) has been able to supply our readers with a special account of the proceedings. From this it will be seen that, although the Highways Committee's recommendation was passed without a division, the Council and the Committee itself were by no means unanimous. Mr. W. M. Mordey had been called in to report whether the defects which had prevented the system from working smoothly could be remedied, and after an exhaustive study of the subject and some actual tests under working conditions, he recommended that certain modifications should be made in the arrangements, and that the system should not be abandoned. So much is admitted by the Highways Committee of the Council; but they have decided not to act upon Mr. Mordey's suggestion, and have not had the courage to publish either his report or the reports of their permanent officers, which, they say, are adverse to a continuance of the experiment. A suggestion is also made that the attitude of the Board of Trade makes it impossible to go on with the system, for the Board will not signify its acceptance of the route in advance; but, however much the officers of the Board of Trade may approve of Mr. Mordey's remedies, they are obviously unable to pass the line until it is actually working under the modified conditions. The action of the Council is much to be regretted. An opportunity has been given for demonstrating whether a surface-contact system, embodying the best effort that has yet been made to solve this difficult problem, can be usefully applied under the severest conditions to which any tramway system could be subjected, and the trial was within measurable distance of success. The practicability of the system has already been proved for some years under less onerous conditions at Lincoln, and there was every reason to believe that it would be applicable in other towns. We cannot but think that the decision of the Highways Committee—and in this we are supported by remarks made in the discussion yesterday morning—is due rather to political motives than to considerations of engineering economics.

200-VOLT TANTALUM LAMPS

THE 200–250-volt tantalum lamp will be placed on the market on Tuesday next in 32-c.p. and 50-c.p. sizes, at a retail price of 5s. each.

THE 32-C.P. 200-VOLT TANTALUM LAMP (1·7 WATTS PER BRITISH CANDLE).—FULL SIZE.

The 32-c.p. lamps can be supplied in two efficiencies, viz., 1·7 watts per British c.p. and 2·2 watts per British c.p.—the former at voltages from 200 to 250, and the latter only at 200 to 230 volts. The 1·7-watt lamps, with the usual B.C. caps, are $5\frac{9}{16}$ in. long and $2\frac{1}{2}$ in. diameter, and the 2·2-watt lamps $5\frac{13}{16}$ in. long by $2\frac{15}{16}$ in. diameter. The 50-c.p. lamps are only supplied for the better efficiency (1·7 watts per candle), and have the larger sized bulb—$5\frac{13}{16}$ in. long over the cap, and $2\frac{15}{16}$ in. diameter.

The 32-c.p. 1·7-watt lamps are recommended for use on direct-current circuits alone, whereas the 50-c.p. 1·7-watt lamps and 32-c.p. 2·2-watt lamps may be used on either direct- or alternating-current circuits.

As is seen in the illustration, in general appearance the high-voltage tantalum lamps closely resemble the familiar tantalum lamps of lower voltage; the difference is that they contain two filaments wound upon two sets of supporting arms instead of one only.

High-voltage tantalum lamps, it is added, possess the same mechanical strength, long life, and suitability for burning in inclined positions as the tantalum lamps for lower voltages.

The above particulars have been sent us by Messrs. Drake & Gorham (the chief selling agents, 66 Victoria Street, Westminster), and by Messrs. Siemens Bros. Dynamo Works, Ltd., who are also in a position to supply these lamps to the trade at their lamp department (Tyssen Street, Dalston, N.E.). Messrs. Krupka & Jacoby (11 Queen Victoria Street, E.C.) also announce that they hold a stock of the new lamps for prompt delivery. Messrs. Drake & Gorham advise their customers that, as in the case of the low-voltage tantalum lamps, they recommend pip-obscuration, which is done free of charge. Totally obscured lamps, as before, will be 9d. extra per dozen.

Although good stocks of 200–230-volt 1·7-watt lamps and 200–210-volt 2·2-watt lamps are held, they warn purchasers that there may be a slight delay in obtaining supplies of 240- and 250-volt 1·7-watt lamps, and also 220- and 230-volt 2·2-watt lamps.

Trade Discounts.

Messrs. Drake & Gorham inform us that the prices quoted above are subject to a trade discount of 20 per cent., with the following rebates for quantities taken over a period of twelve months :—

500 and upwards	... ...	2½ per cent.
2,000 ,,	... ...	5 ,,
5,000 ,,	... ...	7½ ,,

Low-voltage lamps rank in calculating these rebates, that is to say, a customer ordering 2,500 200-volt and 2,500 100-volt lamps would be entitled to the full rebate of 7½ per cent. on his order for 5,000 lamps.

Terms of payment, 2½ per cent. cash monthly account, or 5 per cent. cash with order.

COLLIERY AND MINING ELECTRICAL ENGINEERS

A New Institution.

IN view of the growing importance of electrical engineering in colliery and mining work, a new institution is to be formed, called the Institution of Colliery and Mining Electrical Engineers. It is intended that there shall be two classes of members :—(1) colliery and mining electrical engineers, and (2) members of the Institution of Electrical Engineers who join for professional purposes only.

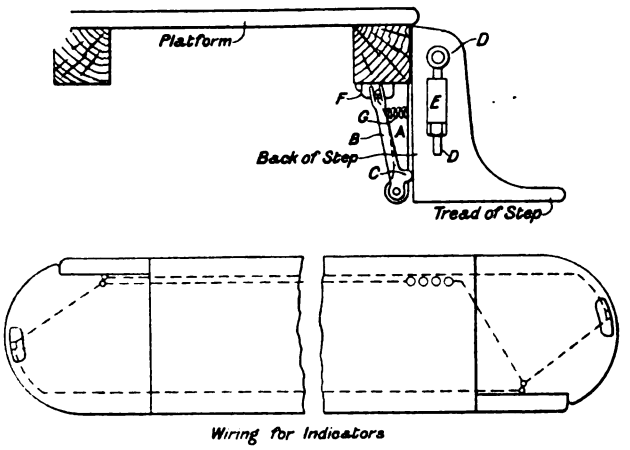
The following rules have been drafted to apply to the former class of members, and in the case of the latter class Rules 1, 2, 3, and 4 will not apply :—

1. That each member must have been in charge of a colliery or mining electrical plant for at least one year, or have worked as assistant for at least two years previous to application for membership.
2. That each member shall be prepared to give a satisfactory reference or testimonial from present or past managers.
3. That each member shall be thoroughly acquainted with the Mines Regulations Acts, 1887, 1888, and 1896, relating to Electricity in Mines.
4. That each member must be prepared to pass a practical examination on Electrical Work by the Institution in order to hold a certificate of competency given by the Institution.
5. That no new member shall be admitted unless the Committee are absolutely satisfied that he is thoroughly experienced and fully competent to take charge of any colliery or mining plant.
6. That the Committee have the right to terminate a membership upon thorough investigation of wilful neglect of his duties or incompetency, or through any actions discreditable to the Institution.
7. That all the members shall work together for the benefit and goodwill of the Institution and other members.

The proposal is to hold meetings at various centres for lectures and discussions, and for hearing practical suggestions from members, one of the objects being to

Digitized by Google

keep up a high standard of efficiency in workmanship and materials best suited to colliery and mining electrical work. So that there may be local representations in each mining section of the United Kingdom, the Committee members are appointed from various districts. A register will be kept of members who desire to change their situations in order that they may be recommended to colliery managers who are requiring competent men; several colliery managers have already signified their willingness to support this branch of the Institution work. We understand that a number of prominent men have undertaken to join the Institution as members, and committee members have been chosen for Yorkshire, South Wales, and Lancashire. The honorary secretary and treasurer (*pro tem.*), Mr. J. Williams, is in charge of the electrical plant of the Moresby Coal & Iron Co., Ltd.



It has not yet been decided where the headquarters of the Institution will be, but an inaugural meeting has already been fixed to be held in Manchester on April 24th. When the Institution gets into working order, Papers will be read in different towns at a centre of each mining district, and it is proposed that a monthly record should be sent to each member, containing reports of the meetings and Papers. The subscription has been fixed at £1 1s. per annum.

Intending members are requested to communicate with Mr. J. Williams, 3 Moresby Parks, Whitehaven.

AUTOMATIC FOOTBOARD SIGNAL FOR TRAMCAR DRIVERS

THE Liverpool Corporation has decided to adopt, on all its tramcars, an ingenious apparatus designed by Mr. C. W. Mallins, the General Manager, for the purpose of enabling a signal indication to be given automatically to the driver of a tramcar whenever a passenger attempts to board or alight from the car. The action of the device depends upon a contact being closed by the weight of the passenger as he places his foot on the step.

In operation, a passenger stepping on the footboard slightly tilts the step inwards. This slight movement is magnified through an intermediary lever, which operates a switch closing the circuit, and warning the driver by means of a small lamp or indicator placed

Sectional Elevation and Diagram of Connections of Automatic Footboard Signal.

on the top of the controller (or in some other suitable position) that a passenger is on the footboard, the signal remaining at danger until the step is relieved of the passenger's weight. The switch is then opened by a spring and the light cut off. The variation in the distances between the platform and the step, the step and the ground, due to new and worn wheels, is provided for by adjustable hangers attached to the side frames from which the footboard is suspended, so that the tread of the step can always be adjusted to equally divide the space between the platform and the ground. The arrangement is shown in the figure. At the back of the step a bracket *A* is fixed to the underside of the platform, projecting downwards as far as the tread. Attached to the lower end of this bracket is a lever *B*, having a projection *C* near the fulcrum against which the back of the step abuts. The step is hung on trunnions from adjustable hangers *D*, passing through lugs *E* attached to the side frames and placed well back, allowing of slight swinging motion. When weight is applied to the tread this motion is communicated through the point *C* to the lever *B*, the top end of which is forked, and operates a switch *F*, which is normally held open by a spring *C*. The wiring running from the switch (or contacts) at the respective footboards to lamps or indicators placed on the controllers at opposite ends of the car is connected with the bell circuit, as shown in the lower part of the figure, from which it will be seen how the pressure on one step actuates the indicator at the other end of the car.

PRIVATE TELEPHONE LINES CASE

National Telephone Co. to pay Royalties

THE House of Lords on Friday delivered judgment in the action by the Postmaster-General against the National Telephone Co., in which he claims royalties on telephone lines, used for business purposes connecting up two or more firms, but not leading to the telephone exchange. In the first instance, Mr. Justice Swinfen Eady gave judgment in March, 1907, in favour of the Postmaster-General (Electrical Engineering, March 28th, Vol. I., p. 567), but the Court of Appeal reversed this decision in May, 1908 (Electrical Engineering, June 4th, 1908, Vol. III., p. 871). The House of Lords has now again reversed the decision, so that the case is finally decided in favour of the Post Office, and the company will therefore have to pay royalty on these lines.

It may be remembered that the case has come to be known in telephone circles as the "A to B" case, as this term has been used very much in the proceedings. Private lines may be divided into two classes. The first, A to A lines in which the subscriber has a line or lines connecting two or more instruments all for his own business, and used by himself and his employees, and the second class known as the A to B lines, in which private lines are employed by, say, two firms, A and B, for use between them for business purposes. In the latter category are lines connecting, for instance, the ticket agency of Messrs. Keith, Prowse & Co., Ltd., with a number of theatres and hotels; private lines to fire brigade stations also come in this class, and there are a number of these in London to connect large buildings, &c., with fire brigade stations. The National Telephone Co. paid the Post Office royalties of 10 per cent. of the rental of such "A to B" lines until 1897, but after that date, payment was refused by the company, who desired to test whether those lines were really subject to royalty.

In the Telegraph Act, the following cases are excepted from the Postmaster-General's monopoly :—

(1) Telegrams in respect of the transmission of which no charge is made, transmitted by a telegraph maintained or used solely for private use, and relating to the business or private affairs of the owner thereof; and

(2) Telegrams transmitted by a telegraph maintained for the private use of a corporation, company, or person, and in respect of which, or of the collection, receipt, and transmission or delivery of which, no money or valuable consideration shall be, or promised to be, made or given.

It may be pointed out that the Appeal Court decision was not unanimous, for, whereas the Master of the Rolls was of the opinion that the decision of Mr. Justice Swinfen Eady should not be reversed, Lord Justice Fletcher Moulton and Lord Justice Buckley held the opposite view.

Before the House of Lords, the Attorney-General (Sir Wm. Robson, K.C.), the Solicitor-General (Sir S. T. Evans, K.C.), and Mr. Casserley appeared for the Postmaster-General, and Sir Robert Finlay, K.C., Mr. Danckwerts, K.C., and Mr. Gaine appeared for the National Telephone Co. The Lord Chancellor, in delivering judgment, said that the first exemption did not apply in the case of the lines in question, as it meant lines used exclusively by the individual owner; the use of the singular implied this, and lines communicating to the offices of other people who were not servants or agents of the owner of the line would therefore not come under the exemption. In the second exemption, he also considered the words "private use" conclusive. In his opinion, therefore, the sections of the Telegraph Act given above did not free the company from paying the Postmaster-General the royalty of 10 per cent. stipulated in the company's licence. The Earl of Halsbury, Lord Macnaghten, Lord Collins, and Lord Gorell all concurred.

THE "G.B." SYSTEM ON THE L.C.C. TRAMWAYS

THE Highways Committee of the London County Council have issued a special report with regard to the working of the G. B. surface-contact system on the tramways along the Mile End Road. It will be remembered that car services were in operation on these tramways from June 25th to July 17th, 1908, on which date it was decided to discontinue them, in consequence of reports from the Council's officers as to accidents which had occurred, and other difficulties in the working of the system. On July 28th the Committee reported that the results obtained from the working of the line were such as to show that it would not be practicable to continue the use of the system consistently with the safety of the public using the roads, and the Council decided to obtain outside expert advice on the possibility of rendering the system efficient. Mr. W. M. Mordey, President of the Institution of Electrical Engineers, was appointed to act for the Council in the matter, and recommended certain suggestions with a view to remedying the difficulties and making the working of the lines efficient and safe. Mr. Mordey pointed out that the most serious difficulty, and the one which was mainly responsible for the service being stopped, arose from studs often becoming alive from leakage of current, and that this leakage occurred when the streets were wet and dirty, an arc being formed which kept the stud alive even after the mechanism had risen from contact with the cable. Mr. Mordey suggested the adoption of a device to extinguish this arc. A condenser was inserted across the break to take the spark, and, in addition, a brush behind the car gave a "hooter" signal to warn the driver if a stud remained alive after the car had passed over it. He also advised certain modifications in the studs themselves, particularly the substitution of cast steel heads, which would be almost unbreakable, and an alteration in the stud mechanism to prevent it from being depressed on to the cable by a sharp blow, such as that of a horse's shoe.

Mr. Mordey recommended that an experimental length of track should be overhauled and the studs modified, and that one or two cars should be fitted up with his special device and run over this length of track at night, especially under trying conditions of weather and track. The Council in November, 1908, authorised an expenditure of £500 for the purpose of carrying out these experiments proposed, and entered into an agreement with the G. B. Surface Contact Co. for the carrying out of the work and experiments at the company's cost, the basis adopted being that the Council, if and when it installed and commenced to work, with the approval of the Board of Trade, any portion of the remainder of the Aldgate to Bow Bridge line on the G. B. surface-contact system, would repay such cost. Negotiations subsequently took place as to the precise terms of the agreement, and during their progress Mr. Mordey intimated that he did not consider it necessary to insist on the alterations to the stud mechanism which he had suggested in his report. The agreement as settled provided that all the work and the experiments were to be carried out and completed to the satisfaction of Mr. Mordey.

The Highways Committee have now received from Mr. Mordey reports as to the result of the experimental running of a car on the system as modified. From these it appears that Mr. Mordey is satisfied that he has found a remedy for the live studs due to arcing. He admits, however, that under certain conditions of weather, as well as from mechanical causes, there may be studs which stick, and, by their mechanism continuing in contact with the cable, remain alive. But he thinks that these would be few in number, and would be detected by the warning device on the car. Mr. Mordey confidently advises the Council to proceed with the overhauling of the remainder of the route, and the equipment of the necessary cars for a full service, and his estimates of alternative methods of dealing with the route are as follows:—(1) Equipment of whole route and 24 cars, £6,951; (2) Equipment of whole route and 12 cars, £4,971; (3) Equipment of Cambridge Road to Bow section and 24 cars, £6,293; (4) Equipment of Cambridge Road to Bow section and 12 cars, £4,313.

The Board of Trade arranged for their officers to take opportunities of inspecting the work and experiments while in progress, and the Highways Committee recently asked the Board for an expression of opinion whether they would be prepared to approve of the working of the tramways on the G. B. system, with the modifications proposed by Mr. Mordey. The Board have replied that they are not in a position to say what their decision in the matter would be until after the re-inspection of the lines has taken place. From this, say the Committee, it would appear that no expression of opinion from the Board can be expected unless and until the Council has overhauled the route and equipped the necessary cars, as proposed by Mr. Mordey, which they understand would take two or three months, and has applied to the Board for inspection of the lines before opening them for public service. In addition to the lack of any assurance from the Board of Trade that, if the Council incurs the expenditure necessary for overhauling the remainder of the track and equipping the cars for running thereon, the Board will approve the modified system, the Chief Engineer and the Chief Officer of Tramways have considered Mr. Mordey's reports and are of opinion that the experiments, which have so far been carried out, do not satisfactorily remove all the objections. Mr. Mordey's device has, no doubt, continues the report, succeeded in overcoming to a great extent one of the main difficulties which were experienced in the working of the system as originally constructed. Nevertheless, "without wishing in any way to prejudice the question whether or not as the result of experiments on a more extended scale the system might ultimately prove satisfactory," the Committee think, after very careful consideration of all the circumstances, that the interests of the Council would be best served by laying the track on the conduit system from Gardiner's Corner to Burdett Road, and by installing the overhead system from Burdett Road to Bow Bridge. This recommendation is on the assumption that the Stepney Borough Council gives the necessary consent to the overhead system being used on the portion of the route in its borough, viz., from Burdett Road to Coborn Road. It will be remembered that the Poplar Borough Council has already consented to the overhead system on the portion of the route within its borough, viz., between Coborn Road and Bow Bridge.

The estimates of the cost of adapting the lines in the manner suggested are as follows:—(1) Aldgate (Gardiner's Corner) to Cambridge Road—Conduit trackwork, raising road-level, dealing with pipes, &c., £30,000; electrical equipment, &c., £750. (2) Cambridge Road to Burdett Road—Conduit trackwork, raising road-level, dealing with pipes, &c., £30,000; electrical equipment, &c., £1,990. (3) Burdett Road to Bow Bridge—Making good paving at stud heads, &c., £750; electrical and car equipment, &c., £2,836, making a total expenditure of £66,326. A considerable proportion of the expenditure included in (1) and (2) is due to the necessity for raising the road-level in view of the fact that the Whitechapel and Bow Railway runs underneath the road, and it is this which renders the installation of the conduit system so expensive on this route. The Stepney Council has not yet indicated to the Council the position which it intends to take up with regard to the use of the overhead system. It is recommended that the trackwork between Gardiner's Corner and Cambridge Road should be executed by Dick, Kerr & Co., Ltd., whose tender was considerably the lowest of those received in connection for previous work of this character in the East End of London.

The Finance Committee report that, in their opinion, from a financial point of view the course suggested by the Highways Committee is the best which can be adopted. In connection with the installation of the G. B. system from Aldgate to Bow estimates on capital account amounting to £83,460 have already been approved as follows:—Trackwork (including royalties but excluding rails), £55,000; cables, ducts, &c., £13,850; special equipment of 48 cars, £3,610; and rails, £11,000; and the Finance Committee will report at a later date as to the steps which should be taken for dealing with such expenditure as will be rendered abortive in the event of the present proposals of the Highways Committee being agreed to.

DISCUSSION ON THE REPORT.

(By Our Own Reporter. Strictly Copyright.)

Owing to the meeting of the County Council on Tuesday being the last before the Easter recess, an all-night sitting was held in order to dispose of all the items on the agenda. It was therefore not until 3.30 a.m. yesterday (Wednesday) that the above report was reached.

Mr. A. Shirley Benn, the Chairman of the Highways Committee, briefly recapitulated the reasons for the abandonment of the system, as set out above. He pointed out, however, that the line had been an experiment, and although some people called it an extravagant experiment, he thought he could state, without fear of contradiction, that experiments were absolutely necessary for a tramway system such as that in London. At the present time, the Council had in operation both the conduit and the overhead systems, but neither was perfect, the former being expensive to instal and costly to maintain, whilst the latter was cheaper to instal and cheaper to maintain, but was disliked on account of its unsightliness. Naturally, therefore, the County Council was bound to investigate new systems, and, if recommended by their officers, to try them. This was what had happened in the case of the G.B. system, which was recommended for experiment before the present Council came into office. When the present Council came into power, the Council's officers were instructed to prepare a further report, and in this they considered the G.B. surface-contact system was the best of all the surface-contact systems, but both the Chief Engineer and the Chief Officer stated that they could not say whether it would be a good system for London until it

Digitized by Google

was tried experimentally. These officers pointed out the risks that would be run, but the Council decided to undertake the experiment. The result, however, was not considered satisfactory, and although the G.B. system might be a good system, it had not proved itself quite suitable for the traffic or the mud of London. A good deal had been said about the enormous expense, but no one yet knew how much of the material could be used again. The rails and granite setts would be used again; £14,000 or £15,000 worth of material had not yet been touched; the cross-overs would be removed to other overhead lines; and he was able to say that the total cost per mile of the scheme put forward in the report—partly conduit and partly overhead—including all the expenses of the G.B. system—would not be more than the cost per mile of the conduit system on the Tooting route.

Sir John Benn said that, judging by the small attendance of the Municipal Reform party, if the conduit system were laid in the Mile End Road, it would be due to the Progressive votes. As a matter of fact, the Highways Committee of the late Council had investigated all known surface-contact systems, and had refused to have anything to do with them, and the late Council had nothing whatever to do with recommending the experiment with the G.B. system in the Mile End Road. In fact, every Progressive except one voted against the proposal when it came before the Council.

Mr. Whittaker Thompson, who was Chairman of the Highways Committee when the G.B. system was adopted, and considered himself more or less responsible for its introduction, said he could only give the present recommendation of the committee lukewarm support. Personally, he was still convinced that the surface-contact system was the system of the future, and he looked forward to the time when all difficulties and defects in connection with them would have been overcome by electrical experts. At the same time he was bound to accept the position taken up at the present time by the Highways Committee. He knew the difficulty that they had had to put up with both inside and outside of the Council and also in committee, for members had approved of the system in committee and rounded upon it in the Council; in fact, the only one who was consistent in his opinions upon the matter throughout had been a Progressive, namely, Mr. Ward. This gentleman knew more about the technical side than anybody else on the Council, with the exception, perhaps, of Mr. Gordon, and Mr. Ward had always given the committee the best of his advice until Sir John Benn, as leader of the Progressive party, had given instructions for Mr. Ward to oppose it. The system had been done to death by slanderous doings. Sir John Benn had not stated the whole facts with regard to the inception of this experiment. It was well known that the Borough Councils always declined to allow the overhead system in their areas, and that was the reason why the present Council thought the adoption of the G.B. system would get over this difficulty, in order to avoid the heavy capital expenditure in laying the conduit system in the Mile End Road, an expenditure which the Progressive party had always refused to incur. He repeated his assertion that the system had been hounded down unfairly; the system was a good one, but he would not at that moment move an amendment that it should be kept going in London.

Mr. H. H. Gordon (Whitechapel) said he considered the report very unsatisfactory, as the Highways Committee, without rhyme or reason, had determined to abandon the system in spite of the advice of their own expert, Mr. Mordey, that it could be worked satisfactorily. This did not show any great courage or business capacity. The fact was that the present Council had not considered anything else than the mere difference in capital expenditure; did they ever obtain a report as to working expenses and did they ever consider the difficulties to which the officers of the Council had drawn attention in the reports which they had submitted? The officers could be proud of these reports, for the very difficulties which they anticipated had been experienced. It was a fact that surface-contact traction had proved a failure in all cases in which it had been tried, and when the matter was first brought up in the Council he had repeatedly brought facts to prove this. He characterised the Highways Committee's conduct as a disgraceful disregard for financial economy and efficiency. Six months ago Mr. Mordey had reported to the Council that it would be necessary every few months to renew the carbon-contact pieces of the studs; he also called attention to the fact that the wear on the cables would be similar to the wear on the studs, and that every few months expensive repair and maintenance charges would become due. Did the chairman of the committee ever look at this matter from the financial point of view and find out what it meant in money? Even to the present day the Highways Committee had nothing more than a vague generalisation of the increased charges which would result from the use of the system. Mr. Mordey, in answer to questions in committee with regard to working expenses, said that certain items would be 1 per cent. higher than with the other systems, that other items would be 2 per cent. higher, and other items 5 per cent. higher, and so on; but the committee seemed to have regarded these as individually small increases and overlooked the aggregate. Why were they giving up the system? Mr. Whittaker Thompson had stated that it had been unfairly treated. Why did he not then have the courage of his conviction and ask for it to be continued? The reason was that no confidence was felt in such a system anywhere in London. All Mr. Mordey's experiments, in his opinion, had been failures. Horses had been electrified in spite of all the experiments, and it was this which had hurried the committee in their decision. He claimed that the whole experiment had been got up for political motives, and it would be a considerable time before the tramway system recovered from the injury which had been done to it. The current estimates placed before the Council that day had proved this, for a decrease in the net revenue was put down to the Bow Road experiment.

The report was then agreed to without a division.

THE WEST STANLEY COLLIERY DISASTER

Investigation of the Electrical Arrangements

THE inquiry into the circumstances of the explosion at the West Stanley Colliery, Durham, which occurred on Feb. 16th, was concluded on Thursday last. It will be remembered that the explosion took place about 3.30 o'clock in the afternoon, and that of the 197 men in the pit at the time only 29 were rescued. Although the inquiry extended over a period of ten days and nearly two hundred witnesses were examined, the jury have been unable to come to any conclusion as to the primary cause of the explosion. They found, however, that all the seams in the colliery were in good working order, that proper precautions for the safety of the men had been taken, that the ventilation was efficient, that those lamps which were recovered were in good condition, and that all the rules had been complied with. The explosion itself took place, they concluded, in what is known as the Busty Seam, and was due to coal dust, but they were unable to state the cause of the ignition of the coal dust. They added that no culpability attached to anyone.

Mr. John Graham, coroner for the district, conducted the inquiry, and the jury consisted of twenty members. Mr. R. A. S. Redmayne and Mr. R. Nelson appeared for the Home Office, Mr. Atherley Jones, K.C., for the Durham Miners' Association, Mr. R. W. Cooper for the colliery owners and the Coal Owners' Association, and Mr. F. Shortt for the Miners' Deputies' Association.

Among the witnesses examined was Matthew Elliott, the sole survivor from the Busty Seam, who stated that he heard the explosion and that the electric lamps went out immediately afterwards. He had a safety lamp with him, and, by the light of that, saw a cloud of dust; directly after this he became unconscious. With regard to the possibility of the ignition of the coal dust having been due to electrical causes, evidence was given relating to two accidents to cables previous to the date of the explosion. The first of these accidents occurred in connection with an electric coal-cutting machine, the trailing cable of which had been allowed to get caught between the guide on the machine and the wall. The insulation of the cable was damaged, a short-circuit produced, and an arc was seen, but in the absence of gas there was no explosion. The second case of arcing was due to the fact that a cable had been damaged by a fall of stone consequent upon the firing of a shot. Both these accidents happened over two months before the disaster, and the cables had been repaired at once in each case. It has been ascertained, moreover, that at the time of the explosion only two motors were running, namely, one driving a pump in the Busty seam, and the other driving the hauling gear in the Towneley seam, and that the coal-cutters were disconnected. After the explosion the cable to the pump motor was found to be intact. The cable to the hauling motor was damaged, but there was no evidence of external arcing, and it appeared that the damage was due to mechanical causes. All the fuses in the pit, with the exception of one or two in lighting circuits, were found intact, but the main fuse at the generating station went at the time of the explosion.

Dr. W. M. Thornton (Professor of Electrical Engineering, Armstrong College, Newcastle) gave evidence to the effect that the electrical apparatus in use in the mine was safe and reliable. He emphasised, however, the importance of protecting the distributing boxes from coal dust, and suggested that if the surface of the board between bare terminals were oily, coal dust might collect upon it and form a bridge which by electrostatic attraction might eventually lead to a short-circuit. Mr. R. Nelson (H.M. Electrical Inspector of Mines) pointed out that if the terminals were kept clean, as they should be, there would be no danger of this occurring; he agreed, however, that terminals should not be left uncovered.

Another possible cause of ignition which was elicited during the examination of witnesses was that a spark might have been caused by friction between the flanges of the tub wheels and the rails, but there was no evidence in support of this except that it appeared from the statements of the man in charge of

Digitized by Google

the hauling gear of the Busty seam that the tubs were off the rails at the time of the explosion.

Another cause which may rank with both of the above-mentioned in probability was only briefly referred to. We understand that in the roadway where the expert mining witnesses agreed in placing the point of origin, three 7/20 rubber-covered leads conveyed current to two 5-h.p. motor-driven centrifugal pumps. It is possible that one of these cables may have sustained mechanical damage, and that an arc may have appeared external to the cable in consequence. Against this suggestion it may be urged that the fuses protecting the circuit in question were found to be intact after the accident. But, again, it appeared from evidence that when a cable damaged by shot on a previous occasion, referred to above, caused an arc, the fuse failed to blow.

It is more than probable that the true cause of the accident will never be known, but it may be said that the inquiry has directed attention to one or two important points, and raised at least one important query. In the first place, we would recommend colliery managers to take steps to ascertain that fuse-boxes and the like purporting to be gas-tight are actually so in fact, and, secondly, wherever there may be terminals, whether motor terminals or switch terminals, exposed to coal dust, careful attention should be given to their cleanliness. The query raised by the known failure in one case of a fuse to operate suggests that in fiery mines some more certain and rapid means should be found of opening a faulty circuit. At West Stanley the system was three-phase alternating current, and therefore an oil-break switch with trip coil, not necessarily in substitution for but in series with fuses, would have provided a more rapid and certain means of opening a faulty circuit.

THE COLLISION AND FIRE ON THE LANCASHIRE AND YORKSHIRE RAILWAY

Board of Trade Report.

THE Board of Trade report on the collision and subsequent fire which occurred on January 21st at Marsh Lane junction of the electrically worked section of the Lancashire & Yorkshire Railway between Liverpool and Southport has now been issued. The inquiry was held by Col. E. Druitt, in conjunction with Mr. A. P. Trotter (Electrical Adviser to the Board of Trade). It will be remembered that a train standing at the junction on the down line was run into in the rear by another train, and that a fire broke out which involved another train which was standing on the up line alongside. No fatalities resulted, but a few persons were injured.

Col. Druitt explains how the collision occurred owing to a breach of the signalling regulations, which was admitted by the signalman in question. The collision was not severe, as the rear train was proceeding slowly, but there was some slight telescoping of the leading motor compartment of the rear train, which apparently caused an arc between the positive and negative cables, and as a result the circuit breakers opened at the sub-stations. Current was put on again in about three minutes, which enabled the train on the up line to proceed, but on account of the fire the motorman of the first train put down his short-circuiting bar, and the current went off again, causing the train on the up line to come to a stand with its rear coach opposite the fire in the motor compartment of the rear train. There was some difficulty in liberating the driver of the rear train. Suggestions as to the desirability of additional middle doors in carriages of the type in question are considered by Col. Druitt in the report, but, as far as this particular railway is concerned, he is not of the opinion that the adoption of end doors only is attended with any extra risk from fire to the passengers.

The causes of the fire are dealt with in an appendix by Mr. A. P. Trotter. It appears that in the motor compartment of the rear train main cables rise from below the floor on each side of the controller up to the circuit-breakers, and are fastened to the front of the compartment. Fire was seen breaking out on each side of the controller between the floor level and the circuit-breaker level, but there was no trace of fusion on any of the steel work of the car. It seems, therefore, that an arc occurred between the positive and negative cables, and that the fire started from this cause. Since the arc occurred on the conductors before they reached the circuit-breakers, continues Mr. Trotter, these were useless for cutting off an excess current. Under certain circumstances shoe fuses would have stopped an excess current. There are eight shoes to each train; it frequently happens that two shoes, and not infrequently only one shoe, has to collect the whole current for starting a train. It is found necessary to set the circuit-breakers at about 1,500 amperes each, and that about 2,500 amperes are required as a maximum. Experiments have been made with shoe fuses which blew at 1,100 amperes. It is clear that such a fuse would blow, or indeed two such fuses would blow, if one or two shoes only were in contact when a train was started. It is impossible in view of the gaps required for the complicated junctions on this line to arrange that a larger number of shoes should be always in contact with the positive rail Protection cannot, therefore, be looked for on this line in the provision of shoe fuses. A heavy short circuit is prevented by circuit-breakers at the sub-stations. On a previous occasion I have called attention to the rather heavy currents for which these circuit-breakers have been adjusted, and the multiplication of sources of current for the feeding of any one section of the line. Acting on my suggestions the company have reduced the setting of the circuit-breakers by an amount, which, though not large, has had a marked effect upon the frequency of the opening of the circuit-breakers, showing that the practical limit has been approached if not arrived at

It is not desirable that circuit-breakers should open so frequently that switchboard attendants should consider the occurrence to be of trifling importance. On a former occasion I have alluded to the careful way in which the opening of circuit-breakers is recorded, and the reasons, so far as possible, analysed by this company. I am informed that further systematic observation of this matter has been arranged, and that in future the opening of any circuit-breaker will be reported by telephone to the power house, and that inquiries will be made thence by telephone from the other sub-stations feeding the section of line in question, and that if other circuit-breakers have opened, inquiries will be made before they are closed.

The evidence of the sub-station attendants shows that the circuit-breakers on this occasion did not open with an unusual report, and when the Hall Road battery circuit-breakers were closed, some 2,000 to 3,000 amperes were observed to pass with no indications that anything unusual was occurring.

A portion of a recording ammeter chart is reproduced in the report, which shows that a sudden rush of about 2,700 amperes passed at the collision, but no appreciable current passed afterwards for about 3½ minutes, when a current of about 2,000 amperes indicates the starting from Seaforth of the 7 o'clock ex Southport train. About one minute later there is an indication of some 3,500 amperes, which no doubt marks the short-circuit caused by placing the short-circuiting bar on the line by the driver with the view of cutting off the current. These, continues Mr. Trotter, agree well with the logs of the sub-station attendants, and the chart shows that the fire was not caused by any continued passage of a large current; the question of fuses and circuit-breakers may therefore be dismissed.

The gradual growth of the fire also shows it was due to the ordinary spread of fire on combustible substances, namely, wood and the insulating materials of the cables.

In conclusion the following recommendations are made :—

Within two or three feet of the electrical equipment of the motor compartment fireproof construction should be carried out. Metal, uralite, or asbestos materials should be substituted for woodwork wherever possible, such as for panelling, partitions, fillings, &c. Wooden beams and posts should be covered with metal or other fireproof protection, and where wood is necessary it should be suitably treated to render it non-inflammable. These alterations should be gradually carried out on the existing rolling stock, and any new stock should be constructed from the beginning on these lines.

Electrically-driven Addressograph.—A machine with self-contained motor drive, which has been especially designed to meet the requirements of the Prudential Assurance Co., is now on view at the show-rooms of the Addressograph Co., 91 Shoe Lane, E.C. The chief interest in the machine lies in the special means provided for printing addresses and particulars of the holder's policy on different parts of the same form, for printing addresses only, and other particular arrangements. The different movements of the table and the stops for adjusting the forms are entirely automatic, and the required movement is obtained by sliding the corresponding button on the table. The whole of the mechanism, including the motor, is enclosed in a neat rectangular cast-iron pillar, and the aluminium table is balanced by the receiving tray, so that it is easily swung open to change the chain of plates. A ⅓-h.p. 1,200 r.p.m. continuous-current motor, with double reduction spur gearing, drives a spindle carrying a sprocket wheel through a clutch, and this latter is geared to the spindle carrying the operating cam by means of a chain. The first spindle drives the two endless bands on the table through a rubber belt. To operate the machine, the motor is started by means of a handle at the side of the pillar, and then the clutch is put by depressing a small knob just below the table. Shunt regulation is provided for varying the speed of the machine. It is stated that whereas a clerk can only prepare about 300 forms a day when filling in the particulars and addresses by hand, this machine will turn out over 7,000 forms a day. The operator has to feed in the blank forms only, as the machine stops automatically when it has printed from all the links of one chain. Although the Prudential Assurance Co. has already five electrically operated machines, this one is the first of the self-contained pattern; it has proved so satisfactory, however, that twelve similar machines have been ordered.

NATIONAL ELECTRICAL MANUFACTURERS' ASSOCIATION

THE annual general meeting of this Association was held at Dartmouth House, Westminster, on March 23rd, Mr. H. Bevis being in the chair.

The report of the committee pointed out that the Manchester Electrical Exhibition, which had been initiated by the Association in conjunction with the Manchester Corporation, had proved a great success. Members of this Association who had exhibited had received a preferential discount on rent for space, which had averaged more than their yearly subscription to the Association, in addition to the further return which had been made to all the exhibitors. A meeting of manufacturers of electric light fittings had been recently held with a view of deciding on a uniform procedure in certain cases. In order to increase the usefulness of the Status Bureau, the committee propose that this should be worked in conjunction with the British Traders' Association. A satisfactory scheme had been drawn up giving considerable benefits to members. The services of the Association had been of use to a member in a dispute with a railway company. Mr. H. Bevis had been elected chairman of the committee. The secretary, Mr. W. Davenport, having resigned, Mr. F. B. O. Hawes (formerly with the Langdon-Davies Motor Co., Ltd.) has been appointed to succeed him, and the offices will be moved to Balfour House, Finsbury Pavement, London.

In moving the adoption of the report, the chairman drew attention to the benefits which the members had, in the majority of cases, obtained from the Association, and several members present, in supporting him, stated that they had saved their subscriptions many times over owing to the assistance obtained from the Association. The chairman also pointed out that the meeting of the manufacturers of electric light fittings had been well attended, and it had been resolved to have a further meeting.

The report and accounts having been duly adopted, the retiring members of the committee were re-elected, and Messrs. B. Longbottom and D. N. Dunlop were elected members of the committee. Messrs. Stanley Marsh and Beaver were elected auditors. The election of Mr. F. B. O. Hawes as secretary was confirmed, as also were the arrangements with the British Traders' Association.

Telegraph Traffic.—There are no further interruptions to announce, but several of the cables already reported as down are not yet repaired. A fire at Santiago-de-Chile has destroyed the cable offices there, causing an interruption to cable communication north and south of that town, but no doubt the damage will be speedily repaired.

Wireless Telegraphy and Telephony.—It is stated that during some recent military experiments, communication was established between Berlin and Vienna, a distance of over 340 miles, with two light portable wireless sets on the Telefunken system.

Since August last year, wireless apparatus on the Telefunken system has been in continuous use on two German sea-going steam trawlers, the range of the sets installed being 60 and 85 miles respectively. It is stated that the apparatus has proved of considerable value as a means of communication, both between the two ships and between the ships and the home port.

The Fessenden Wireless Telegraph Co. has secured the United States Government contract to erect a station at Washington with a 600 ft. tower, and to equip several vessels with wireless apparatus. The range of the station is to be 3,000 miles, and the total cost of the work will be over £36,000.

The Junior Institution of Engineers.—At the last meeting of this Institution, a Paper was read on "Dielectrics, and the principal tests applied to Them," by Mr. Thomas Germann and Mr. Stanley M. Hills. The experiments of Fessenden, Symons, and Baur were dwelt upon, and problems met with in high-tension distribution entered into. Construction and tests of insulators, qualities of porcelain, glass, and air, molecular action, effective voltage and striking distance for dry air, methods of testing for breakdown voltage, and the influence of time of application of the electric stress, were dealt with in that connection. Passing on to transformer and switch oils, their qualities were set forth and modes of testing described. The very important position held by varnishes in insulation work was pointed out, and Warner's experiments were referred to. The ageing effect on insulation was well illustrated by a series of curves, and it was shown that deterioration was due to atmospheric and drying effects, and to the rapid alternations of the electric stress. Linen, cambric, mica, marble, and artificial stones having been considered, the slot method of testing for breakdown voltage, advocated by the authors, was described, and the comparative results obtained were shown. The Paper concluded with the statement that "all the present methods of coil insulation, such as rubber, varnished paper, &c., are unsatisfactory, the ideal insulation being one which can be applied in the form of putty or paint, and one which is a simple substance and not a compound."

VICTORIA FALLS AND TRANSVAAL POWER COMPANY

APPLICATIONS have been invited during the week for 900,000 6 per cent. £1 cumulative preference shares at par, participating up to 10 per cent. The Engineer-in-Chief and the Electrical Engineer of the company state that the profits of the company should allow of a dividend of 6 per cent. on the preference shares for the years 1909 and 1910, and the estimates furnished by the consulting engineers for the extensions show that upon an output of 400,000,000 units per annum, which should be reached in the year 1911, the maximum dividend of 10 per cent. could be paid. The prospectus refers to an agreement with Mr. W. A. Harper, who it will be remembered recently contracted with fifteen mines, controlled by the Rand Mines, Ltd., for the supply of power. Under this agreement the Victoria Falls Power Co. will form the Rand Mines Power Supply Co., Ltd., with a capital of £1,500,000, and the whole of the £500,000 ordinary shares will be subscribed by the company at par. The remaining £1,000,000 will be advanced by the company. No mention is made of the consideration paid to Mr. Harper under this agreement, nor is any reference made in the prospectus to the terms of the contract with the Allegemeine Elektricitats Gesellschaft for the electrical plant the company has ordered from time to time. In this connection the following letter from Mr. Theodore Rich, of 104 St. George's Square, London, S.W., which appeared in Monday's *Times*, is of interest:—

"It is interesting to note from the detailed prospectus of the Victoria Falls and Transvaal Power Company recently issued that contracts for the supply of the whole of the electrical machinery required have been placed in Germany. Counting the orders placed and those that will eventually be placed to supply the mines with electrical plant, the value of work lost to the manufacturers of Great Britain will exceed three millions sterling. Judging by recent public contracts at home and abroad, British steam electric turbine machinery is cheaper and more reliable than that made in any other country, and it is significant that the prices to be paid for this German machinery are not specifically stated in the complete prospectus. The development of the steam turbine as a heavy power unit has been due to British enterprise and the genius of the Hon. C. A. Parsons, and a country that can build a 70,000-horse-power *Mauretania* can certainly build a 30,000-horse-power generating station. The results that have been obtained with the machinery in the power stations of the London County Council tramways and the Glasgow Corporation lighting departments have been unequalled on the Continent, taking into account the working conditions, and this shows that it is quite unnecessary to call in Continental engineering experts to assist in power generation or transmission work of this character. It seems a pity that a British company should assist in creating a virtual monopoly for German electrical manufacturers on the Rand, at a time when a number of the large engineering works are on short time and thousands of unemployed are to be found in our large cities, and the British taxpayer is being called upon to make heavy sacrifices to pay for the Transvaal debt and the cost of new *Dreadnoughts* to compete with German naval aspirations. It is very usual to hear financiers and other business men running down the manufacturers in this country, though statements of this kind are not always of a disinterested character; and with regard to electric-power machinery, given financial support, open contracts, and fair play, British manufacturers have nothing to fear with reference to price or quality from any foreign country."

Owing to ill-health, Mr. H. Wilson Fox has resigned his seat on the board.

Metropolitan Association of Electric Tramways Managers.—The members of the above Association held their usual meeting at the Municipal and County Club, Whitehall, S.W., last Friday. The hon. secretary reported he had received a further letter from Mr. Rowlands respecting the issue of composite licences to motormen and conductors holding the two licences. He (Mr. Rowlands) had recently addressed a question, in the House of Commons, to the Home Secretary, inquiring whether a decision had yet been arrived at regarding the issue of a composite licence, and had received the gratifying reply from Mr. Gladstone that the Commissioner of Police hoped to issue from May 1st next the composite licence asked for. The concession in question was one that had been pressed for by deputation to the Home Secretary and the Commissioner of Police, and the subject of negotiations for some three years past, and it was unanimously decided to express the best thanks of the Association to Mr. Rowlands for his efforts in the matter. The recent letter from the Commissioner of Police regarding disabled cars was discussed, as were also various other matters, and the hon. secretary was requested to send letters accordingly. It was decided to hold the next meeting of the Association on Friday, June 11th next, and to accept the invitation of Mr. W. E. Hammond to pay a visit to the Metropolitan Electric Tramways system.

LOCAL NOTES

ABERDEEN: *The Tramways Undertaking.*—Mr. J. A. Bell, the City Electrical Engineer, has prepared a report dealing with the question of a separate power station for the tramways undertaking. He gives a list of 61 municipal undertakings taking electricity from combined lighting and traction stations, and shows that Aberdeen charges a price which corresponds very favourably with other municipalities, even though in many instances these other places have an advantage so far as the price of coal is concerned. It has recently been suggested that the Aberdeen Electricity Committee charges too low a price for tramway supply. In discussing the position of the combined undertaking generally, Mr. Bell points out that although they are not bound to do so by law, the Committee have set aside no less than £55,551 for depreciation, over and above sinking fund and interest charges, and that, in addition, the percentage of rates and taxes paid is considerably higher than elsewhere.

ACTON: *Proposed Lease of the Electrical Undertaking.*—Another meeting of the Council has been held, at which the terms offered by the Metropolitan Electric Supply Co. for the leasing of the electricity undertaking for 37 years were rejected by seven votes to six. Finally a committee, composed of members of the majority and minority, was appointed to negotiate with the company to secure better terms, and also that energy be provided for street lighting at 1d. per unit.

BATH: *Electricity Works.*—Mr. Schenk has expressed himself willing to reopen negotiations with the Corporation with regard to the purchase of the municipal electricity works. His suggestion, however, that a joint conference should be held is not to be entertained by the Corporation.

BECKENHAM: "*Linking Up.*"—Communications are proceeding between the Council and the South Metropolitan Electric Light & Power Co. with regard to giving a mutual supply in the event of breakdowns. There is some doubt, however, whether in the present state of the law this is permissible. The "linking up" powers contained in the Acts of Parliament which were passed last year only apply to London, and Beckenham is outside.

BELFAST: *Cavehill and Whitewell Tramways.*—The Corporation have rejected the proposed agreement for intercommunication between the Corporation tramways and those of the Cavehill and Whitewell Co. The general trend of the discussion was that the Council prefers to purchase, but the opinion was expressed that the company will now promote their Bill for compulsory running powers, which was withdrawn a few years ago, when the Corporation agreed to purchase the lines. The House of Commons rejected this latter proposal, and an endeavour was made to arrange mutual running powers, but without success, as reported above.

BETHESDA: *Electric Lighting.*—Mr. Price F. White, the Electrical Engineer to the Bangor Council, has prepared a scheme for the electric lighting of Bethesda. Mr. White, however, has reported that in his opinion the cost would be too great to justify a Council of this size to adopt electricity, having regard to the possible revenue.

BIRMINGHAM: *Tramway Receipts.*—For the financial year ending March 27th, the tramway receipts amounted to £287,255, an increase of £4,024 over those of the previous year.

BLACKPOOL: *Tramway Receipts.*—The receipts for the municipal tramway system during the year ended March 31st amounted to £3,000 less than the estimate.

BURMAH: *Electric Supply.*—In exercise of the powers conferred by Section 4 (I.) of the Indian Electricity Act, 1903, the Lieutenant-Governor, says the *Board of Trade Journal*, granted a licence to the Burma Electric Tramways & Lighting Co., Ltd., of Mandalay, for the supply of electricity within the Mandalay municipality.

CANADA: *Water Power Electric Plant.*—The *Board of Trade Journal* states that application will be made to the Canadian Parliament during its present session for an Act incorporating a company, under the name of the Fundy Tidal Power Co., to develop and utilise the power from the tidal flow of certain waters, rivers, and basins emptying into the Bay of Fundy, and to supply electric energy therefrom.

DAWLISH: *Electric Supply.*—The Council is inquiring of the Electric Supply Corporation, to whom they transferred their electric lighting provisional order, when a commencement is likely to be made with the erection of the works.

DUNDEE: *The New Power Station.*—Owing to differences between the Burgh Engineer, and Messrs. R. M'Alpine, the contractors for the building of the new power station at Carolina Road Port, the arbitrator, Mr. John Ferguson, of Glasgow, provided for under the contract, is to be called in. A report by the Burgh Engineer stated that the additional time required to erect the new generating station was explained by the inability of the contractors to complete the foundations in the period within which they had offered to do the work; the change by the Council from a light design of superstructure to a heavier and more permanent form of construction; the inclement weather, and trouble with tidal water. The total additional time required was about seven months. The Electrical Engineer reported that in so far as delay in the station was affected by the machinery and apparatus for which the Electricity Department was responsible, there was and had been no delay. Most of the machinery had been ready and waiting for delivery for some time. As regarded the station building, pumping chamber, and the district sub-stations, the Council had placed all this work on the City Architect. The Electricity Department had no responsibility for or control over this part of the work. He was quite confident that the works could have been ready for last winter's load had he been allowed to carry out his original scheme.

EDINBURGH: *The Trackless Trolley System.*—The Burgh Engineer has prepared a report dealing with the trackless trolley system, and suggests the use of this upon a route of about 2¼ miles within the city, and 2¾ miles outside the city. The capital cost is estimated at £7,500 for the overhead equipment, £10,500 for the cars, and £2,000 for car sheds, buildings, &c., making a total of £20,000. The total working expenses per car mile are put at 9·50d.

HASTINGS: *Electric Supply Tariff.*—At a special meeting of the Corporation last week, it was decided to adopt a recommendation of the Electricity Committee to increase the charge for electric lighting from 6d. to 6½d. per unit, and to increase the charge for arc lamps by one penny per unit. A discount of 15 per cent. is to be allowed off all accounts over £100.

LEEDS: *Tramway Receipts.*—The total receipts from the municipal tramways during the year ending March 31st amounted to £338,031, compared with £336,447 of the previous year. The number of passengers carried was 76,215,613, an increase of 481,535 over those for the previous year. The receipts per car mile were 10·36d. against 10·49d.

LIVERPOOL: *First-Class Cars.*—The Traffic Sub-Committee, in its endeavour to make the first-class cars which were inaugurated last year, pay, are revising the fares.

Threatening Sir Charles Petrie.—At the Liverpool Police Court on Tuesday, a man named A. E. Kennedy, who was at one time employed in the Corporation's Electricity Department, was bound over in his own recognisances of £500 and two sureties of £250 for twelve months for sending a number of letters to Sir Charles Petrie, the Chairman of the Tramways Committee, threatening to take his life. The alternative was six months' imprisonment.

LONDON: *London County Council: Tramway Estimates.*—In delivering his budget speech at the London County Council on Tuesday, Mr. Hayes Fisher, the Chairman of the Finance Committee, stated that the estimated surplus on the tramways for 1909-10, after providing all interest and sinking fund charges, setting aside two-thirds of a penny per car mile for renewals, and meeting the deficiency on working of horse lines of £43,695, was £44,557; total capital expended up to March 31st, 1909, (nearly) £9,500,000; debt outstanding on March 31st, 1909, (say) £8,150,000; debt repaid (£1,070,000 out of revenue, and £280,000 out of proceeds of sales), (about) £1,350,000; estimated expenditure on capital account in prospect, apart from new proposals now before Parliament, £3,250,000; estimated expenditure in 1909-10 (excluding tramways not yet authorised), £1,600,000; and the estimated amount remaining to be expended at end of current financial year, £1,650,000.

MADRAS: *Electric Supply.*—A cable message has been received from Madras stating that the town supply of electricity has commenced from the company's main generating station, the completion of which has been so long delayed. The supply to the tramways will, it is hoped, be made shortly.

MIDDLESEX: *New Tramways.*—The County Council has directed their engineer to prepare plans for a new electric tramway service from Enfield to Enfield Highway. This line will connect with the Finsbury Park and Waltham line.

SOUTHALL-NORWOOD: *Transfer of Provisional Order.*—The Council has given notice of its intention to transfer its electric lighting provisional order, granted in 1905, to the Metropolitan Electric Supply Co., the consideration being £165.

SOUTHAMPTON: *Electricity Department.*—The actual receipts from the Electricity Department for the year ended March 31st, 1909, amount to £30,728, compared with the estimate handed in at the beginning of the year of £30,350. The expenditure amounted to £15,475, compared with the estimate of £15,679. After meeting interest and redemption charges there is a balance of £3,106 against the estimate of £2,291. After meeting special expenditure there is a balance of £1,852, which is transferred to depreciation and renewals account.

Tramways Department.—The receipts for the year ending March 31st amounted to £56,185, compared with the estimate of £54,440. The expenditure amounted to £37,160, compared with the estimate of £35,690, and after meeting interest and redemption charges there is a balance of £7,210 against the estimate of £6,975. After meeting capital expenditure out of revenue to the extent of £431, it is proposed to transfer the balance to depreciation and renewals fund.

SOUTH SHIELDS: *Tramway Receipts.*—The receipts from the municipal tramways for the year to March 31st amounted to £28,716, compared with £29,097 for the previous year. The number of passengers carried was 7,147,639, against 7,202,418.

Digitized by Google

TRANSVAAL: *Pretoria Power Co.*—The *Board of Trade Journal* states that an application will be made to the Transvaal Assembly during its next session for leave to introduce a private Bill authorising the incorporation of a company called the Pretoria Power Co., Ltd., to use the waters of the Crocodile River (Eastern Transvaal), and of its tributaries for the generation of electric power, and to establish wires for the transmission of electric current in the districts of Barberton, Carolina, Lydenburg, Middelburg, Pretoria, and Witwatersrand. Notice has also been given of the intention to apply to the Transvaal Assembly for leave to introduce a private Bill authorising the incorporation of a company, called the Rand Mines Power Supply Co., Ltd., to establish wires and pipes for the transmission of electric current from a power station to be erected by the company at some point near or between Lawley Station and Canada Junction, along the railway to such points on the same within the Witwatersrand district as the company may desire.

TYLDESLEY: *Provisional Order Transfer.*—The Council have decided to transfer their electric lighting order to the Lancashire Electric Power Co.

YORK: *Tramways.*—A ratepayers meeting has been held to consider the policy of the Corporation of working the tramways itself, and a resolution was passed urging the Council to lease the tramways to a company, owing to the serious financial responsibility which would be incurred if the Corporation worked the lines itself.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BATH.—The Electricity Committee recommend that a loan amounting to £11,699 for electricity extensions be applied for.

BECKENHAM.—Condensing apparatus and economiser plant is to be installed, at an estimated expenditure of £2,800.

BUCHAREST.—The municipality contemplate erecting an electric generating station at an estimated cost of £80,000. Plans have already been prepared.

BUXTON.—A Local Government Board inquiry was held on Wednesday into an application by the Council for sanction to borrow £724 for the purposes of the electricity undertaking.

CLECKHEATON.—Tenders are invited for the supply of cable during the ensuing twelve months. Particulars from the Clerk, and tenders by April 19th.

DARTFORD.—Tenders are invited by April 21st for the supply of 800 yards of triple concentric feeder cable. Particulars from the Clerk.

DUBLIN.—The Corporation invite tenders for the supply and erection of sub-station switchboards and accessories. Particulars from the City Electrical Engineer, and tenders to the chairman of the Lighting Committee, 3 Cork Hill, Dublin, by April 20th.

DUDLEY.—The Electricity Committee recommend the installation of a storage battery of a capacity of 300 kw., together with the necessary booster plant, and a motor-generator of 150 kw. capacity, for transforming current from lighting to traction voltages, or *vice versa*. The capital cost of the plant, together with the necessary buildings, is estimated at £6,000.

EASTBOURNE.—Two 100-kw. transformers with switchgear are to be purchased at a cost of £472. A water softener is to be installed. Mains are to be extended in Roseberry Avenue, Hampden Park, at a cost of £104.

GLASGOW.—Tenders are invited for cables, meters, and arc-lamp carbons. Particulars from the Electrical Engineer, and tenders to the Town Clerk by April 26th.

LEYTON.—A Local Government Board inquiry was held last week into an application by the Council for sanction to borrow £1,650 for extensions to the electricity works.

LIMERICK.—Tenders are invited for accumulator accessories, cable, mains accessories, meters, &c. Particulars from the Engineer, and tenders to the Clerk by April 16th.

SALFORD.—The Local Government Board is to be asked to sanction a loan of £2,200 for the sinking of a bore-hole at the electricity works, and the erection of pumping plant, &c., required in connection with the supply of water for evaporation "make-up" for the water-cooling scheme.

SHREWSBURY.—The Sanitary Committee recommend the installation of an electric generating plant at the Sanatorium.

Miscellaneous

BRISTOL.—Tenders are invited by April 21st for electrician's work in connection with the Council's school at Southwell Street, Kingsdown. Particulars from the Secretary to the Education Committee, Guildhall, Bristol.

BRITISH GUIANA.—The Government is considering the question of extending the telephone system in Berbice.

LONDON: *London County Council.*—Tenders will shortly be invited for 200 bogie truck double-deck tramcars, fitted with roof covers and draught screens.

The Highways Committee have reported with regard to the continuation of the tramways along the Victoria Embankment and over Blackfriars Bridge, to join up with the system which terminates there at present. The estimated cost of the construction and equipment of the lines upon the underground system is £21,280, and it is recommended that authorisation for the expenditure of this sum should be given.

The Highways Committee also recommend that the reconstruction of the tramways in Highgate Road between Kentish Town Road and Swains Lane, at an estimated cost of £31,531, be put in hand. At present there is an isolated service of horse cars running on this route. Considerable alterations will be necessary to the bridge carrying Highgate Road over the Midland Railway, and these, it is recommended, should be put in hand at once to avoid delay in the electrification of the lines.

ROUMANIA.—The *Board of Trade Journal*, quoting from a foreign exchange, states that the Communal Council of Bucharest have accepted the draft bill relative to the construction of new electric tramway lines, wherein provision is made for the formation of a Roumanian company with a capital of £160,000, of which the municipality will subscribe a quarter, the balance to be obtained by public subscription. The municipality will also erect at Grozaveshti electric works for the generation of power for electric traction and for lighting. For this latter purpose and for other Corporation works parliamentary sanction will be applied for to contract a loan of £400,000.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—Woolmore Street School, Poplar (£1,563). Builders, E. Lawrance & Sons, Wharf Road, City Road.

N.W.—Enlargement of Bell Lane School, Hendon (£2,871). Builder, W. J. Maddison, Clarkson Street, Bethnal Green.

Operating room at North Infirmary (£727). Builders, Mattock & Parsons, 165 Grays Inn Road, W.C.

S.E.—Alterations to Mantle Road, Deptford, School (£904). Architect, T. J. Bailey, L.C.C. Education Committee, Victoria Embankment, E.C.

School, Manor Lane, Lewisham (817 places). Architect, T. J. Bailey, L.C.C. Education Committee, Victoria Embankment.

Adaptation of old Lambeth Town Hall, Kennington, for central offices of the Waifs and Strays Society, Savoy Street, Strand.

Technical College, Tower Bridge Road, Bermondsey. Builders, Dove Bros., Ltd., Wesleyan Methodist Hall, Westminster, S.E.

S.W.—Nurses' home, Wandsworth Union Infirmary, Clapham. Architect, J. S. Gibson, 5 Old Bond Street, W.

W.—The Kensington Board of Guardians have adopted the recommendation of the sub-committee to introduce electric lighting into Marloes Road Workhouse Chapel at a cost of £107.

W.—Building between 119 Piccadilly and Down Street Tube Railway Station, Kensington. Architect, E. Keynes Purchase, 20 Maddox Street, W.

Alterations, &c., to the Palace Theatre, London, Provincial & Continental Vaudeville Combination, Adelphi Terrace House.

W.C.—Building, Catherine Street, Strand. Architect, G. A. Fox, 9 John Street, Adelphi, W.C.

PROVINCES.

ACCRINGTON.—Swimming Baths (£10,000). Surveyor, W. J. Newton, Accrington, builders, F. Higson & Son, Blackburn.

AYR.—Skating rink (£3,000). J. C. Reid, 209 St. Vincent Street, Glasgow.

BLACKPOOL.—Public Health Offices. J. S. Brodie, Borough Surveyor, Blackpool.

BOURNEMOUTH.—Pavilion (£70,000). F. E. Lacey, Borough Surveyor.

COLNE.—Technical and secondary day school (£4,500). Architect, T. H. Hartley, Colne, Lancs.

DONCASTER.—Technical school (£12,000). F. O. Kirby, Borough Engineer, Doncaster.

EXETER.—Training College. Architect, J. Harvey, Bampfylde Street, Exeter.

GUILDFORD.—Workhouse nurses' home (£2,282). Architect, E. L. Lunn, 36 High Street, Guildford.

HUDDERSFIELD.—Baptist church and school (£3,554). Architects, Garside & Pennington, Pontefract and Castleford.

LIVERPOOL.—Rubber works factory. T. Hulme, Royal Insurance Buildings, South John Street, Liverpool.

LUTON.—School buildings (£8,899). Architects, J. R. Brown & Sons, Castle Street, Luton.

MAIDSTONE.—Residence (£2,476). Architect, St. Pierre Harris, 8 Laurence Pountney Hill, E.C. Builders, W. Archer & Son, "The Grove," Gravesend.

Digitized by Google

MANCHESTER.—Insurance premises, St. Mary's Gardens. H. Fairhurst, Spring Gardens, Manchester.

NORTHAMPTON.—Skating rink, St. James Park Road, for Byng-Hall, Goodriche, & Percy.

PLYMOUTH.—The Electrical Engineer is to be instructed to prepare an estimate of the cost for the installation of electric light at the Grammar School premises in North Road.

SALFORD.—Infants' School, Nashville Street (£2,500). O. Duthie, Secretary Salford Education Committee.

Council School for Boys, Wellington Street, Pendleton (£4,847). Builder, J. Byrom, Whitelegge Street, Woolfold.

STOKE.—Wesleyan Church. F. La Trobe, 44 Corn Street, Bristol.

STRETFORD.—Extensions to Technical Institute. Surveyor, E. Worrall, Stretford.

SWANSEA.—Block of offices for T. T. Pascoe (£4,200). Architects, Margrave & Peacock, Metal Exchange, Swansea.

WARRINGTON.—School, Evelyn Street. T. Longton, Surveyor, Warrington Town Council.

TENDERS RECEIVED AND ACCEPTED

DULVERTON.—Messrs. Crossley Bros., Ltd., have received an order for one of their new high-speed four-cylinder vertical engines, type "CV4," speed 750 r.p.m. This engine is to be connected by a flexible coupling with a 12-kw. dynamo, and is to be used as an auxiliary at the Dulverton electric lighting station.

EALING.—The Education Committee have accepted the tender of Park Bros., Ltd., at £487, for the wiring of Lammas Council School.

EDINBURGH.—The tender of Messrs. Pratt Bros., of Edinburgh, has been accepted at £477 for the electric wiring of the Marine Gardens.

LEYTON.—The Council have received the following tenders for the supply of six miles of public lighting cable :—Standard Cable Manuacturing Co. (accepted), £563 8s.; Aubert Grenier & Co., £630; Union Cable Co., £648; Lahmeyer Electrical Co., £740; Callender's Cable Co., £822; Glover and Co., £822; Henley's Telegraph Works Co., £822; Western Electric Co., £822; Siemens Bros., Ltd., £827 10s.; British Insulated & Helsby Co., £828; Johnson & Phillips, £828; St. Helens Cable Co., £840. The following tenders have been accepted for annual supplies in connection with the electricity undertaking :—Wakefield & Co., engine oils, £130; Lucy & Co., service terminal boxes, 6s. 6d., mounted (estimated value of goods to be supplied, £80); Oliver Arc Lamp Co., flame arc lamp carbons, £240; Siemens Bros. & Co., cable compound, £60. The Council has placed an order with the Underfeed Stoker Co. at £2,458, for mechanical stokers for eight boilers.

The Electrical Co., Ltd., are to supply Blondel flame arc lamps on trial, provided that they guarantee that the cost of carbons per 4,000 lamp hours does not exceed £2 19s.

LONDON: *London County Council.*—A contract has been entered into with Messrs. Dick, Kerr & Co. for road-work and plate-laying in connection with the reconstruction of the tramways from Hackney Road, *via* Cambridge Road and Whitechapel Road, at £20,130.

The following tenders have been received for a mechanically operated auxiliary track brakes for electric cars :—Hurst, Nelson & Co., Ltd., Motherwell, Design A, £2.892 10s.; Design B, £2,762 10s.; Design C, £2,600. Mountain & Gibson, Ltd., Bury (*not to specification*), £3,315, £3,087 10s., and £2,535. The Electro-Mechanical Brake & Engineering Co., Ltd., West Bromwich, £3,412 10s., £3,380, and £3,152 10s.; alternative tenders (*not to specification*), £2,665, £2,665, and £2,405. Brecknell, Munro & Rogers, Ltd., Finsbury Pavement, E.C., £3,818 15s., £3,565 5s., and £3,477 10s. Heenan & Froude, Ltd., Worcester, £4,322 10s., £4,192 10s., and £4,615. The British Westinghouse Electric & Manufacturing Co., Ltd., Manchester, £4,615, £4,420, and £4,290; alternative tender (*not to specification*), Design B, £3,575. Tenders were invited for three different designs of platform gear as follows :—Design A—With the platform gear arranged for screw operation through machine-cut steel pinions, gears, and bevel wheels. Design B—With the platform gear arranged for screw operation through machine-moulded cast-steel pinions, gears, and bevel wheels. Design C—With the platform gear arranged for operation by means of a spindle and twisted chain instead of the screw operation through pinions, gears, and bevel wheels, as in designs "A" and "B."

The committee have very carefully considered the tenders received, and think that the brakes with platform gear made in accordance with design "C" should be obtained. It will be seen from the list set out above that the lowest tender for brakes of this design is the alternative offer of the Electro-Mechanical Brake & Engineering Co., Ltd., the second lowest offer being that of Mountain & Gibson, Ltd. Neither of these tenders, however, is in accordance with the specification, and the committee suggest that the next lowest tender, viz., that of Hurst, Nelson & Co., Ltd., amounting to £2,600, should be accepted.

Westminster.—The following tenders have been received for the electric wiring and provision of two arc lamps at the first-class swimming-bath, Buckingham Palace Road, for the Westminster City Council : L. Sunderland & Co., £39 10s. (accepted); Westminster Engineering Co., £39; Drake & Gorham, £49 16s.; Belsham & Co., £54 10s.

PLYMOUTH.—The Corporation has accepted the tender of Walter Scott, Ltd., to supply 120 tons of tram rails and joint and anchor plates at £8 per ton, and fish plates at £10 per ton. Mr. G. Braulik, whose tender for the annual supply of carbons for the electricity undertaking had been accepted at £2 17s. 6d. per thousand feet, wrote that the price should have been £3 17s. 6d. The Electricity Committee, having satisfied themselves that a clerical error had been made, and that the tender even in this amended form was still the most advantageous to accept, agreed to alter the price to the last-mentioned figure.

SALFORD.—The Council has accepted the following tenders, among others, for supplies for the tramway undertaking :—Special car accessories : British Westinghouse Co. (three years); W. Boydell & Sons, Ltd. (three years); Malleable Steel Castings Co., Ltd. (three years). Overhead equipment materials : Watlington & Co. (one year); G. Hill & Co. (one year); British Insulated & Helsby Cables, Ltd. (one year); J. Russell & Sons, Ltd. (three years); Moston Malleable Castings Co. (three years). Ears, frogs, pull-offs, &c. : G. Hill & Co. (one year); Watlington & Co. (one year); Johnson, Clapham, & Morris (one year); Brecknell, Munro, & Rogers (one year); Edward Dewhurst (three years); Tramway Supplies, Ltd. (three years). Car accessories (electrical) : W. McGeoch & Co., Ltd. (three years); John Hall (one year); L. Andrew & Co. (three years); F. Reddaway & Co., Ltd. (three years); British Thomson-Houston Co. (one year); General Electric Co. (one year); Ward & Goldstone (three years); British Westinghouse Co. (one year); C. Macintosh & Co., Ltd. (three years); Liverpool Electric Cable Co. (one year); British Insulated & Helsby Cables, Ltd. (one year); Edison & Swan United Electric Light Co. (three years); Gabriel & Co. (three years); A. Cort & Co. (three years); Stirling Varnish Co. (three years).

The following tenders have been accepted for annual supplies in connection with the electrical undertaking :—Sloan Electrical Co., Ltd., arc lamp globes; Eckstein, Heap, & Co., gravity type ammeters and circuit-breakers; Reason Manufacturing Co., Ltd., maximum demand indicators; J. Daniel & Sons, cable bearers; Sloan Electrical Co., Ltd., motor carbon-brushes.

YORK.—Some 20 tenders have been received in connection with the proposed tramway scheme. It is understood, however, that no contractor is prepared to provide the necessary capital, and that only two offers have been made for leasing the lines.

PARLIAMENTARY INTELLIGENCE

PROGRESS OF ELECTRICAL BILLS.—The second reading of the West Kent Electric Power Bill, which was down for March 31st, has been postponed until April 21st.

The North Metropolitan Electric Power Bill was read a second time, and the Liverpool Corporation Bill a third time, in the House of Lords on Wednesday last week.

The second reading of the Torquay and Paignton Tramways Bill, which was down for March 31st, has been postponed until after Easter.

The Wallasey Tramways and Improvements Bill was read a third time in the House of Commons on Tuesday.

The Central London Railway Bill was read a second time in the House of Commons on Thursday.

The Anglo-Argentine Tramways Bill was read a second time in the House of Commons on Monday.

The London United Tramways Bill was read a second time in the House of Lords on Thursday.

The North Metropolitan Electric Power Supply Bill was read a second time in the House of Lords last week.

UNDERGROUND TELEPHONE LINES.—In answer to a question in the House of Commons last week, the Postmaster-General stated that the transmission of speech over underground telephone wires was much less efficient than when overhead lines are used, and that speech over underground cables becomes practically inaudible at very moderate distances.

The Bat Meter.—The Board of Trade have approved of the Bat meter, type 0, and of the means provided for fixing it.

Royal Commission for the Brussels, Rome, and Tunis Exhibitions.—The first meeting of this Commission was held on Tuesday, at Marlborough House, under the presidency of H.R.H. the Prince of Wales. The Chairman of the Commission is Lord Lytton, and a number of prominent men in engineering circles are members, including, amongst others, as representing electrical interests, Dr. R. T. Glazebrook. H.R.H. the Prince of Wales addressed the meeting at some length, explaining the arrangements which had been made for the forthcoming exhibitions, and spoke of the advantage which the Commission would be to intending exhibitors. The Commission would undertake the entire cost of decorations in the British sections of these Exhibitions, and would supply show-cases, platforms, railings, screens, &c. Also, with a view to encouraging exhibitors to make an effective display of machinery in motion, it is proposed that the Commission shall defray 50 per cent. of the charges made for the supply of power, and assist in the cost of foundations and handling. Lord Lytton replied.

COMPANIES' MEETINGS AND REPORTS

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—The report for 1908 shows that the revenue amounted to £74,874, an increase of £15,497 over 1907, and the expenditure to £43,213, which is £6,960 in excess of 1907. The balance at the credit of the account is £31,661, which compares with £23,120 in the previous year. Adding sundry receipts and the amount brought forward, there is a total of £34,734, and, after providing for debenture and loan interests, and a reserve for the redemption of debentures, there remains an available balance of £23,103. A dividend of 5 per cent. per annum is recommended, the sum of £5,000 is transferred to depreciation account, and the balance of £602 carried forward. The capital expenditure during the year amounted to £61,884, and has now reached a total of £495,705. The total number of units sold was 14,069,611, which is an increase of 2,886,295 units, or 25·7 per cent. The revenue from the sale of energy shows an increase of 26·4 per cent. The Hendon Electric Supply Co., Ltd., has taken a steadily increasing supply of electricity in bulk throughout the year. The supply for "power" purposes has considerably increased, and there is every indication of a large development of the company's business in this direction. Satisfactory results are reported from the St. Albans station and refuse destructor, and the Edmonton and Tottenham electric supply undertakings. The business of the North Metropolitan Electrical Power Distribution Co. has also expanded satisfactorily during the past year. At the meeting on Tuesday, the report and accounts were adopted.

WYCOMBE (BOROUGH) ELECTRIC LIGHT & POWER CO.—The report for 1908 states that the connections have risen from 47,941 to 49,648, an increase of 1,707 equivalent 8 c.p. power lamps. The result of the year's trading, including the balance brought forward, shows a profit of £4,531, and, after paying interest on debentures and outstanding accounts, there remains a balance of £1,477 available for distribution. The directors recommend a dividend at the rate of 2 per cent. for the year, and the placing of £600 to reserve fund for renewal account, leaving a balance of £77. At the meeting on Tuesday last week, the report and accounts were adopted.

METROPOLITAN ELECTRIC TRAMWAYS.—The revenue for 1908 amounted to £331,835, and the total receipts to £300,012. which latter is an increase of £55,812 over the previous year. After meeting all expenses, including £16,566 for reconstruction and renewal of lines, and writing down preliminary expenses, there is a balance available of £52,317. The reserve account has been credited with £6,000, and, after meeting preference dividend, the payment of a 4½ per cent. dividend upon the ordinary shares is recommended, carrying forward £3,707. The route mileage of lines now operated by the company is 42½ miles. The number of passengers carried was 57,369,307, compared with 48,242,404 last year, and the average receipts per car mile were 11·32d. compared with 11·63d. At the meeting on Tuesday the report and accounts were adopted.

WOKING ELECTRIC SUPPLY CO.—At the annual meeting on Saturday, the report and accounts given in our last issue were adopted.

BATH ELECTRIC TRAMWAYS CO.—The report for 1908 shows a gross profit of £12,137, and after meeting mortgage and loan interest, debenture and sinking fund instalment, and preference dividend, the balance of £2,493 is carried forward. The receipts during 1908 were less by £4,500 than those of 1907.

LANCASHIRE DYNAMO & MOTOR CO.—The report for 1908 shows a net profit of £11,742, after meeting depreciation and debenture interest. A final dividend of 5 per cent., making 7½ per cent. for the year, is recommended on the ordinary shares.

AMERICAN TELEPHONE & TELEGRAPH CO.—The net revenue for 1908 amounted to $18,121,707. Dividends absorb $12,459,156; the sum of $3,000,000 has been transferred to reserve, and the remainder is carried forward.

DEVONPORT & DISTRICT TRAMWAYS CO.—The annual general meeting was held in London recently, when it was reported that the half-year to Dec. 31st showed somewhat better results than the corresponding period of 1907; the sum available was £2,499 against £1,699. The whole of this, however, has been placed to renewals and depreciation. Negotiations are in progress with the Devonport Corporation with a view to arriving at an agreement with regard to the working of the leased lines.

ROTHESAY TRAMWAYS CO.—The report for 1908 shows that the sum available for dividend is £1,540. The directors recommend carrying to sinking fund for loan redemption £400, to general depreciation £100, and the payment of a dividend on the ordinary shares of 1½ per cent. The amount carried forward is £82.

GREENOCK & PORT GLASGOW TRAMWAYS CO.—The report for 1908 shows a sum available for distribution of £4,189. After transferring £1,769 to reserve sinking fund for loan redemption and meeting a dividend of 3 per cent. on the preference shares, a balance of £320 is carried forward. The receipts for the year fell to a lower level than in any year since the lines have been worked by electric traction, due to trade depression, and for this reason the full dividend on the preference shares has not been paid.

GUILDFORD ELECTRICITY SUPPLY CO.—The gross receipts for 1908 amounted to £6,772, compared with £6,466 for 1907, and after crediting £1,000 to depreciation, there is a balance of £3,168. After meeting debenture interest and preference share dividend, and placing £400 to reserve, there is a balance of £998. A dividend of 5 per cent. for the year is declared upon the ordinary shares, and £300 carried forward.

LYMINGTON ELECTRIC LIGHT & POWER CO.—At the annual general meeting recently the report and accounts for 1908 were adopted. The year's trading has resulted in a net profit of £1,594, and after meeting interest on debentures and loans the sum available is £1,008. The sum of £500 has been placed to reserve, and a dividend of 5 per cent. declared, carrying forward £129. The directors have decided to discontinue free wiring.

AIRDRIE & COATBRIDGE TRAMWAYS CO.—At the annual meeting last week the report and accounts given in our last issue were adopted.

MISCELLANEOUS CITY NOTES

ORIENTAL TELEPHONE & ELECTRIC CO.—The directors recommend the payment of a 6 per cent. per annum dividend on the preference shares for the half year ended December 31st last, less income tax, and a final dividend of 5 per cent. on the ordinary shares, free of income tax, making a total of 8 per cent. for the year.

SOUTH METROPOITAN ELECTRIC LIGHT & POWER CO.—Warrants for interest on the company's 4½ per cent. First mortgage debenture stock for the half-year ended March 31st, 1909, have been posted.

PRESTON, CHORLEY, & HORWICH TRAMWAYS CO.—It is stated that a prospectus will shortly be issued. The capital of the company is £250,000 in ordinary and preferred stock, whilst there are debentures to the amount of £160,000, and some £150,000 preference and ordinary shares, and 100,000 of debentures have already been taken by influential financial groups.

GREAT NORTHERN TELEGRAPH CO.—The company's receipts in 1908, compared with those of 1907, have again diminished by about £30,000. As a further decline of receipts is to be anticipated in the future, the Board of Directors intend to propose to the general meeting to pay 13 per cent. as final dividend and bonus, or 2 per cent. less than last year, making a total distribution for the year of 18 per cent. (including 5 per cent. already paid), and to set aside the usual amounts to the reserve and pension funds, viz., £55,555 11s. 1d. and £8,333 6s. 8d. respectively, the dividend equalisation fund being augmented with interest only.

UNDERGROUND ELECTRIC RAILWAY COMPANIES OF LONDON.—It is announced that Mr. W. B. Parsons, chief consulting engineer of the Interborough Rapid Transit Company, who a few years ago was retained by the British Government to serve as advisory engineer to the Royal Commission on London Traffic, has been elected a director of the Underground Electric Railways Company of London, Ltd. Colonel Millard Hunsiker, late representative in England of the United States Steel Company, and Mr. W. C. Burton, of the railway contracting firm of J. G. White & Co., Ltd., have also been elected directors of the Underground Company.

Institution of Mechanical Engineers.—The summer meeting will be held in Liverpool from Monday, July 26th, to Friday, July 30th inclusive. Papers will be read in the mornings, and among the visits are the Liverpool-Southport Electric Railway, the Liverpool Corporation Electricity Works, the Mersey Railway Co.'s generating station, and the electrically-driven Anderton barge lift. The Institution dinner will be held on Tuesday, July 27th, in the Banqueting Hall, Exchange Station Hotel, and on Wednesday evening, July 28th, there will be a reception in the Town Hall by invitation of the Right Hon. the Lord Mayor of Liverpool. A Local Committee has been formed to take in hand the necessary arrangements for the meeting.

New High Efficiency Nernst Lamp.—A new lamp has just been put on the market by the Electrical Co., Ltd. It is on the Nernst principle, but is a considerable improvement on the older pattern, and is much cheaper. The 220-volt size gives a candle power of about 30, and takes 0·2 ampere, so that an efficiency of about 1·4 watts per candle is obtained. The lamp itself is small and neat in appearance, the four parts, body, burner, resistance, and globe, being combined. It lights up approximately 10 seconds after switching on. A minimum life of 400 hours is guaranteed, but the average life is stated to be about 700 hours. Lamps can be obtained for use on direct-current circuits of any pressure between 200 and 300 volts, and it is expected that a lamp for use on alternating-current circuits will be available shortly. The light obtained is said to be much softer than that emitted by metal-filament lamps, while the efficiency compares very favourably. The list price of the lamp is fixed at 2s. 6d.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59 5s. (last week same).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The Buenos Ayres Grand National Tramway Co., which is in voluntary liquidation, will hold a meeting of creditors on April 19th at 62 London Wall, E.C., at 12 noon. The latest day for receiving particulars of claims is May 1st.

A. Roberts, trading as Roberts Bros., electrical engineers, 21 North Parade, Bradford, has been adjudicated bankrupt.

AGENCY.—Messrs. Barlow & Chidlaw, Ltd., of Pendleton, Manchester, have arranged with Messrs. Edmiston, Brown, & Co., 224 St. Vincent Street, Glasgow, to represent their interests in Scotland.

INDUSTRIAL SITES.—A good deal of attention is now being paid to the movement for decentralisation of manufacturing industries away from congested districts where rates are high, and not only are industries which, on account of cheap coal, had migrated to the north now returning to the west country, but factories owned by foreigners are being established in that part of England as a consequence of the working of the new Patent Act. The Great Western Railway is showing great enterprise in providing facilities in this direction, and the Chief Goods Manager at Paddington Station has established a special bureau for the purpose of advising manufacturers and others who are contemplating removal or the starting of new works. A register of sites is also kept, and every information will readily be given to inquirers.

NEW ADDRESS.—The Switchgear Co., Ltd., have opened premises in Wilfred Street, off Sherbourne Street, Salford, Manchester. The Manchester offices will in future be the firm's headquarters, but the Birmingham office will remain for local purposes.

CHANGE OF ADDRESS.—Messrs. Richard Moreland & Son, Ltd., give notice that they have removed their engineering works from Old Street to Silvertown. Their general offices will still remain at 80 Goswell Road, London, E.C.

APPOINTMENTS AND PERSONAL NOTES

Mr. C. W. Hill, chief assistant tramway manager and electrical engineer in the tramways department of the Birmingham Corporation, has been appointed to the post of manager of the Bournemouth Corporation tramways, at a salary of £600 per annum.

Mr. Hugh Prideaux (Faraday House student, 1903-1904), has obtained first place in the recent examination for inspectors of factories.

NEW COMPANIES

W. SITCH & CO.—Registered on March 5th, with a capital of £4,000 in £1 shares, to take over the business of electrical engineers, manufacturers of electric fittings, and art metal workers carried on at 48 Berwick Street, Oxford Street, W., as W. Sitch and Co., and to adopt an agreement with A. Sitch and Frances Edwards. The number of directors is not to be less than three nor more than five; the first are A. Sitch and Frances Edwards (both permanent) and W. J. Cornish. Registered office, 48 Berwick Street, Oxford Street, W.

LYME REGIS ELECTRIC LIGHT & POWER CO.—Registered on March 5th, with a capital of £5,000 in £1 shares, to carry on in Lyme Regis, Dorset, and elsewhere, the business of suppliers of electricity for light, heat, motive power, or otherwise, electrical and mechanical engineers, electricians, &c., and to adopt agreements with the Corporation of Lyme Regis. Minimum cash subscription half the shares offered to the public. The number of directors is not to be less than three nor more than six; the first are W. Allhusen, A. D. Pass, P. H. Woodroffe, R. F. Browne, and A. J. Woodroffe. Registered by Withers Bensons, Birket and Davis, 4 Arundel Street, Strand, W.C.

GRATZE.—Registered on March 5th, with a capital of £3,000 in £1 shares, to carry on the business of engineers, electricians, founderers, smiths, machinists, machinery builders, and general contractors, &c. Registered office, 44-46 Whitfield Street, Tottenham Court Road, W.C.

LEPEL WIRELESS SYNDICATE.—Registered on March 6th, with a capital of £20,000 in £1 shares, to adopt an agreement with E. G. Abrahams, and to carry on the business of electricians, engineers, battery makers, founderers, producers, generators, distributors, and workers of electricity, lava, submarine and wireless and aerial telegraphy, &c. Minimum cash subscription, £5,000. The number of directors is not to be less than three nor more than nine; the first are E. G. Abrahams, A. Holt, Viscount Massereene, and Sir Thomas Wyles. Qualification, 100 shares. Remuneration, 5 per cent. of the distributed profits. Purchase consideration, £11,000 (£2,000 cash and £9,000 shares). Registered office, 4 The Albany Courtyard, Piccadilly, W.

BRITISH MEDICAL ELECTRIC APPLIANCES CO.—Registered on March 11th, with a capital of £250 in £1 shares, to carry on the business of electricians, engineers, manufacturers of and dealers in electrical, chemical, laboratory, and other apparatus, &c. Registered by H. G. Davis, 7 New Square, Lincoln's Inn, W.C.

TELEPHONE INSTALMENT SYSTEM CO.—Registered on March 12th, with a capital of £10,000 in 9,995 ordinary shares of £1 each, and 100 founders' shares of 1s. each, to provide by loans or otherwise, or to guarantee for approved persons, firms, companies, and institutions, the subscription, rent, or other payments required by the various telephone companies and institutions of the United Kingdom and elsewhere, to manufacture and deal in telephones, inventions, patents, or improvements, &c. Registered by W. J. Pitman, 11-12 Finsbury Square, E.C.

IMPROVED RAILWAY SIGNALS.—Registered on March 12th, with a capital of £10,000 in £1 shares (7,000 deferred ordinary, and 3,000 preferred ordinary), to construct, manage, or control railways and tramways, the signalling systems and signals connected therewith, &c. Registered offices, 62 St. Martin's-le-Grand, E.C.

RAILWAY & COLLIERY ACCESSORIES CO., LTD.—This company was registered on March 25th, with a capital of £5,000 in £1 shares, to adopt an agreement with W. H. Appleby and T. O. Summers, and to carry on the business of brass casters and makers, electric and other lock makers, makers of railway couplings, mining tub couplings, haulage clutches, aeroplanes, manufacturers of latches, door handles, sash fasteners, &c. Registered office, Brunswick Street, Wolverhampton.

WIRELESS SYNDICATE.—Registered on March 23rd, with a capital of £4,000 in £1 shares, to adopt an agreement with R. C. Gallotti, and to carry on a business not particularly described except in the title. Registered office, Queen's House, Queen Street, Cheapside, E.C.

J. JEFFREYS & CO.—Registered on March 26th, with a capital of £12,000 in £1 shares, to adopt an agreement with J. Jeffreys, E. Herring, and P. M. B. Grenville at 11 Old Queen Street, Westminster, as J. Jeffreys & Co., and to carry on the business of domestic, heating, ventilating, and electrical engineers, &c. Registered Office :—11 Old Queen Street, Westminster.

MORRIS & LISTER, LTD.—Registered on March 29th, with a capital of £10,000 in £1 shares (5,000 preference), to acquire the business carried on at Coventry, to adopt an agreement with D. K. Morris and G. A. Lister, and to carry on the business of manufacturers of and dealers in apparatus, instruments, and fittings used in connection with the generation, distribution, supply, and employment of electricity, electrical engineers, electricians, &c. The subscribers are : D. K. Morris, 47 Cumberland Mansions, Seymour Place, W., electrical engineer; G. A. Lister, Fernlea, Stanmore Road, Edgbaston, Birmingham, electrical engineer. Private company. The number of directors is not to be less than two nor more than five; the first are D. K. Morris, G. A. Lister, and R. K. Morcom. Remuneration as fixed by the company. Registered office : Carlton Works, Lockhurst Lane, Coventry.

CUBAN ELECTRICAL CO.—The *Financial News* states that a joint-stock company has been formed at Bremen under the name of the Cuban Electrical Co., with a capital of 4,500,000 marks, with the object of establishing an electrical works and enterprise in the island of Cuba. Several concessions have already been granted to the new company.

THE ELECTRICAL SYSTEM OF THE L.C.C. TRAMWAYS

At the Institution of Electrical Engineers last Thursday, the discussion on Mr. J. H. Rider's Paper, "The London County Council Tramway System," was resumed. The Paper, reported at considerable length in our last issue, described in detail the arrangements at the generating station at Greenwich, and dealt also with the sub-station equipment and the distributing system.

Mr. S. Z. de Ferranti, who was the first speaker on Thursday, said that he regarded it as a great achievement that Mr. Rider had been able to persuade the London County Council to change their views as to the best position for the power house after so much work had been done upon the site originally selected at Camberwell. He also congratulated Mr. Rider on the efficiency of his boilers, a test upon which, given in the Paper, gave the result of 79 per cent.; this figure, moreover, did not take into account the economisers, and doing so would raise the actual efficiency to the neighbourhood of 86 or 87 per cent. The reciprocating engine gave the very good result of 16 lbs. of water per kw.-hour, and the turbines had a slightly lower consumption, perhaps 1 lb. less, and, taking these two tests together, there would be an actual consumption of about 2 lbs. of coal per kw.-hour. For the past twelve months, however, the actual consumption was 3·1 lbs. per kw.-hour, which, whilst an excellent result, showed a difference of about 50 per cent. in the consumption of coal between test conditions and ordinary running conditions on even so good a load factor as 47 per cent. At Greenwich this represented a money value difference of about £21,000 per annum between the test conditions and the actual running conditions, and emphasised the necessity of reducing the stand-by losses. With regard to Mr. Rider's expression of opinion that it was not so important to have the highest economy as it was to secure absolute reliability in the plant, Mr. Ferranti said that he did not think that reliability need be sacrificed in trying to obtain the highest economy. Looking at the Greenwich power station as a whole, he would have liked to have seen a little less spent on buildings and a little more on plant, if it had been possible. If higher economy could have been obtained as the result, it would have meant a considerable saving, and the contractors on their side would have been able to make a greater profit. In this way the contractors would have been in a position to do what is done abroad, viz., to have funds available for developing experimental work in order to produce more efficient machinery. It was very difficult for large manufacturing concerns in this country to devote large sums of money to improving British work under present conditions of competition, and for this reason this country was apt to lag behind, and improvements came from other countries. In specifying for machinery, it would be more satisfactory if it could be done more upon the basis of the best possible machine rather than by trying to keep everybody in one fixed groove to produce a standard article where everybody could compete with everybody else, *i.e.*, if contracts were allotted rather upon the basis of excellence than upon the basis of lowest price. A very pleasing thing in connection with the Greenwich power house was that Mr. Rider had such a fair coal contract. He thought it was one of the most cheerful signs of municipal trading that he had seen, viz., a contract in which the contractor was absolutely on an equality with the people who were buying from him.

[The coal is North County washed singles, and is brought by steamers directly from Grangemouth on the Forth. The coal is bought annually by contract, and is paid for according to its quality.

The specified standards are :—

Calorific value	12,500 B.Th.U. per lb.
Small (as measured by the quantity which will pass through a wire sieve of ¾ in. square mesh) ...	20 per cent. by measurement.
Moisture	10 per cent. by weight.

The calorific value and moisture are measured by the Council's chemist on samples taken from every 100 tons brought over the pier front. The calorific value is determined by a Mahler bomb calorimeter on a sample previously dried at 100° C., and the amount of moisture is determined on a weighed portion of the sample, as taken from an air-tight sample tin.

The proportion of small coal is ascertained on the pier on a sample of about 50 lbs. in weight, taken, at the option of the Council, either from the hold or from the quantity unloaded by the grabs.

If the quality of the coal in any cargo, as ascertained by samples tested, be found different as regards calorific value, moisture or small, from the above standards, the price paid to the contractor is varied as follows :—

(*a*) If the calorific value exceed 12,500 British thermal units per pound, the price per ton is increased in the same percentage ratio as the increase in the calorific value.

(*b*) If the calorific value be less than 12,500 British thermal units per pound, the price per ton is decreased in the same percentage ratio as the decrease in the calorific value. The Council, however, has the right to reject the whole cargo if the calorific value be less than 10,500 British thermal units per pound.

(*c*) If the moisture be less than 10 per cent. by weight, the weight of coal to be paid for is increased beyond the quantity actually weighed out by a percentage equal to the percentage decrease of moisture.

(*d*) If the moisture exceed 10 per cent. by weight, the weight of coal to be paid for is decreased below the quantity actually weighed out by a percentage equal to the percentage increase of moisture. The Council, however, has the right to reject the whole cargo if the moisture exceed 13 per cent. by weight.

(*e*) If the proportion of small coal be less than 20 per cent. by weight, the weight of coal to be paid for is increased beyond the quantity actually weighed out by a percentage equal to one-quarter of the percentage decrease of small coal.

(*f*) If the proportion of small coal exceed 20 per cent. by weight, the weight of coal to be paid for is decreased below the quantity actually weighed out by a percentage equal to one-quarter of the percentage increase of small coal. The Council, however, has the right to reject the whole cargo if the proportion of small coal exceed 25 per cent. by weight.

These conditions, Mr. Rider said, have worked exceedingly well in practice. The coal merchants were a little chary at first at accepting a contract with such conditions, but, after a little experience, they found that they were easily able to meet them, and the result has been that an increased price is paid for practically every cargo of coal because it is better than the standard.]

Mr. Roger T. Smith (Electrical Engineer to the Great Western Railway) dealt with the change of site from Camberwell to Greenwich in relation to the supply of coal. Mr. Rider had stated in the Paper that the whole of the coal (some 150,000 tons per annum) would have had to be brought by rail, and the ashes removed by the same means, and that taking the difference in freight between rail-borne and water-borne coal at 3s. per ton, the extra carriage alone would have been £22,500 per annum. For boiler furnaces using chain-grate stokers, a bituminous coal having about 25 per cent. of volatile matter was necessary, and the only coalfield that Mr. Smith would consider for generating stations south of the Thames was the Midland coalfield of Staffordshire, Warwickshire, and South Derbyshire. All sea-borne coal, he said, was partly rail-borne, and it must at least be handled twice and sometimes three times before it reached the bunkers. For stations like that at Greenwich it might be possible to get coal from the South Yorkshire coalfields, for which Goole would be the port, and the only other place, so far as he was aware, was a port in the Firth of Forth, where Mr. Rider got his coal. In the admirable specification for coal which had been referred to in the Paper, this, when dry, gave 12,500 B.Th.U. per pound, and he gathered from the success from the contractors' point of view that this nearly always existed. At Greenwich, the cost for last year worked out partly at 14s. 5d. per ton and partly at 11s. per ton, delivered alongside. The freight to an ordinary trader from a place like Nuneaton to the existing railway depôt close to the Camberwell site was 6s. 6d., whilst for any large quantities this would be reduced to 6s. When coal was dear last year, he purchased at Nuneaton, for his Park Royal power house, at 7s. 10½d. per ton delivered in the wagons at the pit, the calorific value being 13,250 B.Th.U. This could therefore have been delivered into the bunkers at Camberwell for 14s. 4½d. without any special rate, or 13s. 10½d. at the special rate. This corresponded with Mr. Rider's 14s. 5d. When coal was cheap at the end of 1908 he purchased exactly the same coal at 5s. 4½d. in trucks at the pit, and this could have been delivered into the bunkers at Camberwell for 11s. 4½d., as against Mr. Rider's 11s. That was to say, coal with a calorific value 750 B.Th.U. higher than that used at Greenwich could have been delivered at Camberwell from the Midlands at the same price, and not for 3s. more, as mentioned in the Paper. But this was not all. Mr. Rider had stated that it was a disadvantage to have to remove the ashes by rail. The Park Royal station of the Great Western Railway had been designed by Messrs. Kennedy & Jenkin on very much the same lines, as far as access and delivery of coal were concerned, as the original station at Camberwell. At Park Royal he was now using the coal already mentioned, which cost 5s. 4½d. per ton at the pit and 5s. 3d. per ton for freight. The cost of conveying coal from the ship to the bunkers at Greenwich might be less than 1d. per ton, but even at ½d. per ton it would be considerably more than at Park Royal, where $\frac{1}{16}$d. per ton covered not only this, but the removal of the ashes. The speaker next compared the coal costs at Greenwich with those at Park Royal, which were lower, although 750-kw. sets were used instead of 3,500-kw. sets as at

Digitized by Google

Greenwich. The maximum load at Greenwich was 16,000 kw., against 4,000 kw. at Park Royal, and the annual output at Greenwich was 66,000,000 kw.-hours against 14,000,000. The cost at Greenwich during 1908 for coal was 0·227d. per kw.-hour received at the sub-stations. He did not care to give the costs for the whole of last year at Park Royal, because the engines were in the makers' hands a portion of the time—and everyone knew that no engine was much good until it was paid for—but during the last two months of this year his actual coal costs were 0·1959d. per kw.-hour generated and 0·2181d. delivered to sub-stations, with a machine load factor of 79 per cent. A station very much smaller in size, combining both lighting and traction, using cooling towers, and having its coal wholly railborne, could thus achieve results equal to a station having its coal wholly sea-borne. At the same time, he admitted that Mr. Rider's results for the past two months would be very much better than the average for last year, owing to the drop in the price of coal.

Mr. C. P. Sparks (Engineer-in-Chief, County of London Electric Supply Co.) said that it was not every Corporation in England that was so public-spirited as the London County Council had been to have the whole of the plant of British manufacture. He hoped the example set to other municipalities would be followed, because it was clear that London had not suffered thereby. Mr. Rider had hall-marked himself for all time as an engineer in selecting the Greenwich site. He asked, however, why a voltage of 6,600 had been adopted rather than a higher one for so large an area, which would certainly be extended. With regard to the coal contract, section (*d*) gave the Council the right to reject the whole cargo if the moisture exceeded 13 per cent. But they could not test the coal until it had been unloaded, as there was a large demurrage on a cargo of coal, so that he thought that a penal clause, providing for a money compensation, would be preferable, as it was nearly always impossible to reject the coal once it was in the bunkers. The Paper stated that considerations of output, space and price were the only determining factors in the selection of turbines instead of reciprocating engines for the generators, but he thought there were further determining factors, and in a year's time Mr. Rider would probably admit that fuel, labour, oil, and repairs were additional determining factors. He thought 94 revolutions was a high speed for Corliss valve gear, and he disagreed with Mr. Bailey in thinking that the engines would outlive the turbines. Turning to electrical matters, the question of reverse power relays was one of the most difficult ones that central station engineers had to deal with, and Mr. Rider had stated that he was almost converted to the opinion that the generators should have no tripping relays whatever.

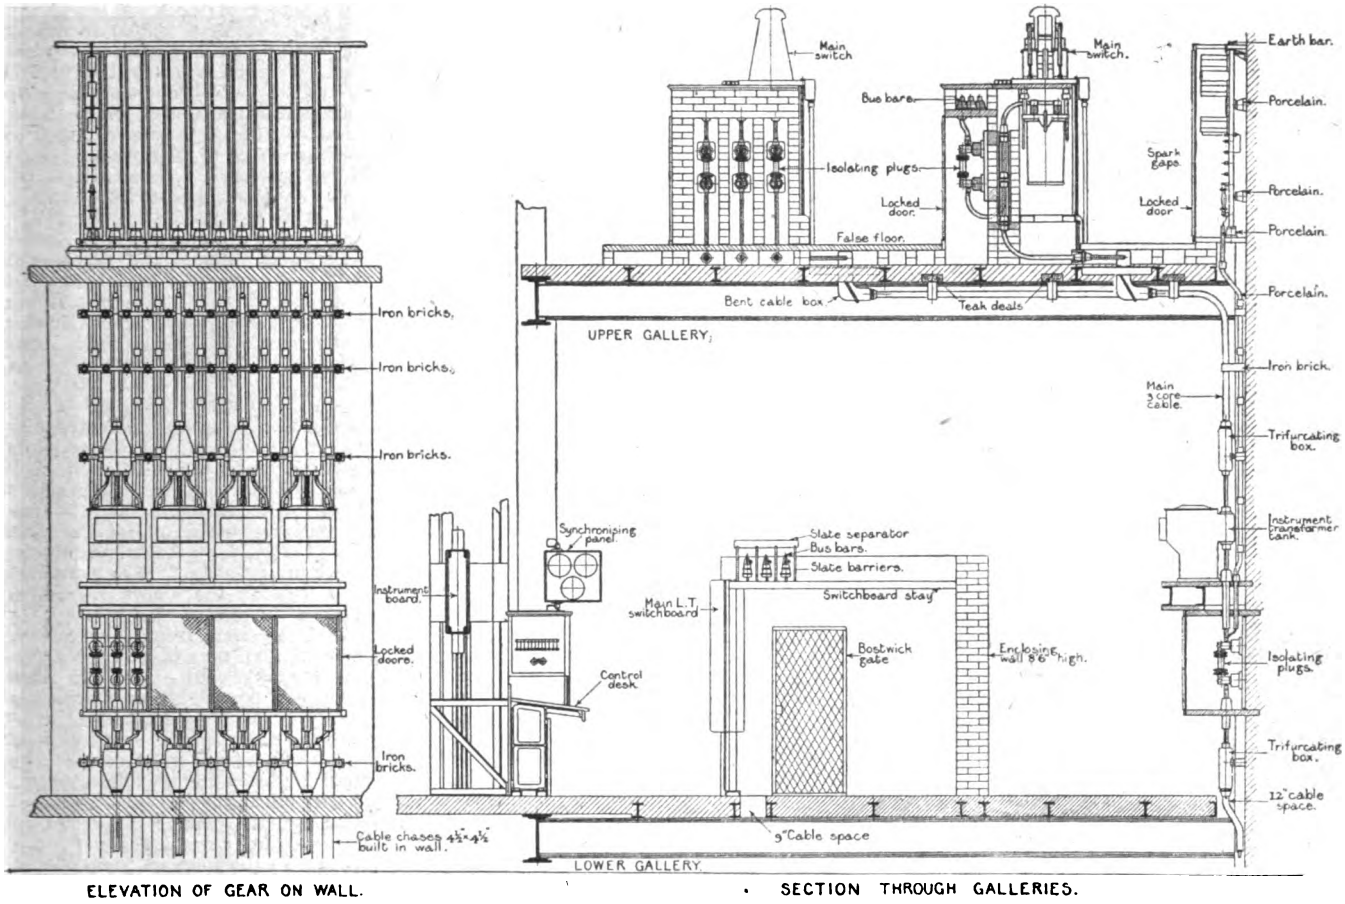
Mr. Rider: That word "almost" should now be "quite."

Mr. Sparks said he was in hearty agreement with that. With regard to earthing the system, they were very much indebted to Mr. Rider for being the first person to point out a solution of this difficult problem. He would like to know whether the 1·25 diversity factor of the sub-stations mentioned in the Paper was the hourly demand of the station, or was it just the instantaneous demand. If it were the latter, of course it would be easily met by the overload capacity of the generating machinery

Mr. Gerald W. Partridge (Chief Engineer, London Electric Supply Corporation) said he had always thought the use of reverse-current relays was a mistake; they were usually either tied up with string or wedged up with pieces of wood. With regard to the earth current from the neutral point of the star winding, he was rather inclined to think that this had something to do with the design of the generator. There were a great many three-phase 25 and 33 period generating stations which had the neutral points all connected up solid; he had four three-phase machines at Deptford connected in this manner, and they gave no trouble at all. He could not help thinking that Mr. Rider's method of driving his centrifugal pumps with three-phase motors was a mistake. Direct-current motors should have been used. With these it was possible to get the different speeds by the use of commutation poles. In the case of loss of steam or sudden overloads, the periodicity would fall and the speed of the three-phase motors would be reduced, so that there would be a bad vacuum just at the time when a good one was wanted. The rush of current in connection with the use of induction motors mentioned in the Paper, was an old trouble, and one with which, unfortunately, he had had considerable experience. In the old days, when they used the old Ferranti converters, and switched them on to the 10,000-volt supply, these rushes occurred, and there was failure at the end of the coils in exactly the same way that Mr. Rider had explained. He had got over this in the case of converters by always connecting the low-tension side of the transformer first, and he had come to the conclusion that it depended more or less on the way the iron had been left magnetised after the last time it had been switched on, and at what particular point in the phase the connection was made. Some four or five years ago he had had exactly the same trouble in switching on some 250-kw. motors to the lighting system, and there the whole difficulty had been got over by water resistances. Induction coils were tried, but were not found very satisfactory. He had been given to understand that the makers now used these water resistances more or less as a standard design. He could not see why Mr. Rider, with his low periodicity (25 cycles per sec.), had not used more rotary converters. He should have thought a considerable amount in capital expenditure would have been saved.

Mr. Robert Hammond agreed with Mr. Rider as to the absolute need for continuity of supply, and this, he thought, had certainly been secured at Greenwich. Perhaps Mr. Rider would tell them whether he had ever had a breakdown at Greenwich, and if so, why. With regard to Mr. Roger Smith's remarks concerning the Camberwell site, the whole burden of the evidence on behalf of the London power schemes had been that riverside stations were absolutely necessary in order to obtain cheap generation. Mr. Smith had not entered into the condensing part of the problem at all. The Institution could surely not endorse the principle of placing a 16,000 kw. station, gradually growing to 50,000 kw. at Camberwell. He believed he was right in saying that on the Rand, where they were working under the name of the Victoria Falls Power Co., and building steam stations, and where the output was expected to reach 500,000,000 units per annum, they had, after some two years' endeavour to find a proper site, decided to go to Vereeniging, which was 37 miles away from Johannesburg, where coal and water were available almost side by side. As an illustration of the wisdom of this policy, he mentioned Hackney, whose lowest costs in the London area were mainly due to the use of river-borne coal. He also drew attention to the excellent results obtained by Mr. Rider, viz., a cost of 0·3311d. per unit, delivered at the sub-stations, or about 0·3d. for the generating costs, and if they searched the records of the country, and even those of Germany, they would not find any place where electricity was being generated so cheaply for such an output and load factor as at Greenwich. His last point was with regard to Mr. Bailey's statement at the previous meeting that Mr. Rider's low costs were due to his good revenue, namely, £85 per annum per kilowatt. Apparently Mr. Bailey had taken the whole of the revenue from the tramway fares, but this was quite wrong. Mr. Bailey's revenue was £253,000, with a maximum load of 23,000 kilowatts, and Mr. Rider's revenue, estimated on the value of the units supplied, was about £200,000 on a load of 16,000 kilowatts, thus Mr. Bailey's revenue per kilowatt of load was about £11, and Mr. Rider's about £12.

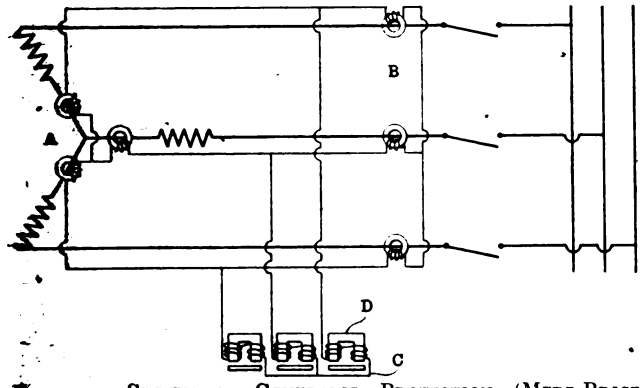
Mr. E. L. O'Brien (Lancashire & Yorkshire Rly. Co.), speaking with regard to the coal specification, said he did not know exactly what the size of Mr. Rider's coal was, but the 10 per cent. degree for moisture seemed to be rather a high standard, and gave the contractors rather more latitude than one would expect.



Mr. Rider: It is washed coal, and that is the reason the moisture is high.

Mr. O'Brien said it was washed coal that he had in his mind. He himself used washed coal at the Formby power station of the Lancashire & Yorkshire Railway, and tests made there did not show that they ever approached 10 per cent. of moisture as an all-round figure for the year. With regard to the generating station, he noticed that the total evaporative capacity of the boilers was 828,000 lbs. per hour, and the maximum working load which Mr. Rider expected to obtain was about 30,000 kilowatts. Adding about 25 per cent. on to the full load steam consumption of his engines, a steam consumption of about 000,000 lbs. per hour would be obtained. It would, therefore, appear that, without forcing the boilers in any way, 25 per cent. of the boilers could be laid off for spares or repairs at the maximum load. (Mr. Rider: That is the idea.) It struck him, considering the extent to which water-tube boilers could be forced if required, that this was rather an excessive figure. Mr. Rider also stated that the steam could be superheated to 550° F., and he would like to know whether the author was working with the full superheat on the Corliss engines. At Formby the speaker was working at 510 degrees temperature, and this seemed about the extreme limit of the ordinary Corliss valve gear. Above this the valves tended to groan frequently, and without the use of graphite the engines did not run quite satisfactorily, as far as the valves were concerned. At Formby they had no separators on the steam pipes. There was a very small steam separator, but he had been quite unable to detect any trace of moisture in the steam coming to the engines. It would, therefore, seem that with steam at 150 degrees superheat, separators were an unnecessary expense. He thoroughly agreed with Mr. Rider as to the necessity of having large clearances in the turbines in order to secure reliability. But it would be very interesting if Mr. Rider could tell them what the clearances were and their percentage of the diameter, and whether they had been measured hot or cold. He had seen many measurements of clearances cold in turbines, but there had never yet been any figures when running at the full temperature. With regard to cross-currents between generators, at Formby there were four 1,500 kilowatt, 25-cycle generators running in parallel; he had put ammeters in the neutral, and like Mr. Partridge he had not found any cross-currents between these engines. But when a 4,000 kilowatt turbine was put in parallel with the reciprocating engines, there were then considerable cross-currents —about 80 amperes working at 7,500 volts. This had, however, not caused any trouble in working, and the generators had

Digitized by Google



been all connected up solid to an earthed bus-bar. He noticed that the feeders at Greenwich were fitted with time limit relays, but in view of the just condemnation of reverse current relays on the generators, he would like to know what was to be said for the time limit relay on the feeder. It seemed to him that the time limit relay was in its proper place on overhead feeders where there was a hope of an arc burning itself out and clearing itself; an arc on a high-tension underground feeder resulted in a dead short, and the sooner the feeder was cleared off the better. In many stations that he had been in he had found that under these circumstances the time part of the time limit relay was out of operation.

Mr. H. W. Clothier (Messrs. Reyrolle & Co.), speaking first on the subject of reverse-current relays for generator protection, said that it often happened that a short between phases or even an earth on a generator would gradually develop and give the switchboard attendant time to pull the machines out by hand, but there were faults which occurred which could not be got out so easily. He had seen a turbo-alternator, for example, simply burst and fly into a thousand pieces. Such an accident, of course, was fortunately very uncommon, but at the same time it might occur in big generating stations, and then what would happen to the switchboard attendant? His solution was to use a balanced system of protection on generators. Such a system had not been very largely used, but it was a feasible scheme, and they could cut out a faulty generator absolutely instantaneously by it without upsetting the other machines or the synchronous plant on the system. He placed a current transformer in each phase of the generator winding as shown at *A* in the diagram below, in addition to the current transformers already existing under Mr. Rider's arrangement as shown at *B*. The secondaries of each set of transformers are connected in star, and the other ends of the six windings are connected to a common neutral point, *C*, through relays, *D*. In the event of a fault occurring anywhere within the zone protected by these current transformers, the relays will be energised and the main switches tripped out. With regard to the construction of the switchgear, Mr. Rider had a trifurcating box, an isolating plug, current transformer, trifurcating box, a cable connection on to the floor above, a third trifurcating box, then an oil switch, on to another isolating plug arrangement, and then on to the bus-

Balanced System of Generator Protection (Merz-Price System).

Mr. Clothier's Suggested Arrangement of Switchgear.

Digitized by Google

bars (see figure on p. 335, reproduced from Mr. Rider's Paper). Whilst following out this principle, he thought he could show that it could be arranged in a much more simple manner, as sketched in the third figure on p. 355. He would put in a slightly different shape casting containing the current transformer, and attach to this the trifurcating box. The bus-bars would be enclosed in a casting just above the current transformer box, and these would be fitted on to a frame. The oil switch would be made in the form of a carriage with contacts which entered plugs connected to the bus-bars and the current transformers. By this Mr. Clothier claimed that he got the isolating arrangement already in existence at Greenwich, that he carried through Mr. Rider's idea of having the transformers enclosed in cast-iron, and that he enclosed everything else in cast-iron, including the bus-bars, and yet had an arrangement which occupied much less space and was even safer. There were no concrete partitions, no brickwork, no joints with cables, and they did away with isolating plugs, which he contended were a source of danger.

Mr. J. F. C. SNELL said there was one point which had struck him, and which must have struck many others, and that was that although the station was commenced in 1901, there was no evidence of patchwork in the whole design, either in the power house, in the transmission system, or in the sub-stations. During the whole of these eight years the scheme had gradually unfolded and developed. Those who had to design growing stations knew how difficult it was to be able to foresee the future and design them on regular lines. Another point was the extreme simplicity of the whole system. Whether they looked at the pipe-work or the switchgear, despite what Mr. Clothier had just said, there was an element of real simplicity throughout the whole scheme, and in his opinion simplicity always meant good design. He would like to ask Mr. Rider, however, why he put the switch cells on the third gallery of the switchboard? Why could he not have put these in the gallery underneath the operating boards? If he had done this he would have saved a very great length of cable, and would have had an equally simple and get-at-able system. Another point was the 33 per cent. of spare plant in the sub-station. Surely this was an excessive amount, and with 20 per cent. of spare plant there would have been a considerable saving in capital expenditure, and at the same time a sufficient assurance against breakdown in the shape of one spare set, plus the overload capacities of the five other motor-generators. In common with Mr. Partridge, he would like to know why Mr. Rider could not adopt rotary converters? If he had, not only would he have saved capital expenditure, but he also would have saved to some extent that initial shock of switching in which was referred to in the Paper; but more particularly he would have saved the inefficiency. Taking the average efficiency of the motor-generators at 82 per cent., he had calculated from the number of units delivered to the sub-station that there would have been a saving of practically 6,000.000 units per annum, or a matter of 10.000 tons of coal, which on the average price came out to £4,200 per annum. This was a very serious figure, but no doubt Mr. Rider would be able to give admirable reasons for his course of action; at the same time he thought that in any new work, and with the low periodicity at Greenwich, rotary converters would give more economical results than motor-generators. It was interesting to notice that the total costs with the reciprocating engines were 0·33d. per unit delivered to the sub-stations. This was only 23 per cent. in excess of the figure which those interested in the London power proposals had estimated as the cost at the Barking power station, a station which was to have been four times the present output at Greenwich. This showed that the figures put before Parliament were not very far wrong. He calculated from the Paper that the units per car mile were 2·24. This was a very high figure, and there must be a reason for it. He knew that the London County Council cars were large and heavy, and that a number of them had magnetic brakes. But if they looked at the Glasgow system, which was a three-phase system with sub-stations—he agreed with smaller cars—the units per car mile were only 1·25. He would therefore like to know the reason for the high figure in London when compared with what was being done on the other systems in the country. Finally, would Mr. Rider give the power factor for the whole of his system?

The President announced that, owing to the large number of members wishing to speak upon the Paper, the discussion would be adjourned until April 22nd, when Mr. W. H. Patchell would reopen it. Time permitting, a Paper by Mr. H. S. Hallo (of Bruce Peebles & Co., Ltd.), on "The Theory and Application of Motor-Converters," will also be read.

Rating of Blackpool-Fleetwood Tramroad.—The House of Lords has upheld the decision of the Appeal Court in favour of rating the Blackpool and Fleetwood tramroad on the basis of a railway and not a tramway. The Thornton Urban District Council has all through contested the company's view that the line is a railway, as it is constructed upon private land, and gained their point in the Divisional Court, but both the Appeal Court and the House of Lords have held to the contrary. The effect is that the company must be assessed upon the basis of one-fourth its rateable value.

CATALOGUES AND PAMPHLETS RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

METAL FILAMENT LAMPS.—The "Z" Electric Lamp Manufacturing Co., Ltd., of Orient House, New Broad Street, are issuing a pamphlet giving particulars of the "Z" lamp, and also an attractive coloured show card. These lamps, including the filaments, are manufactured entirely in England. The sizes at present available range from 20 to 50 c.p. for 100 to 130 volts, and 10 to 50 c.p. at 25 and 50 volts. They are equally suitable for continuous and alternating currents, and can be used in any position. An initial efficiency of from 1·1 to 1·23 watts per c.p. is claimed, but this is stated to improve to 1 watt per c.p. after a few hours of burning, and to remain at this figure throughout the greater portion of the life of the lamp.

GEARING.—A booklet from Messrs. André Citroën & Co. contains particulars and illustrations of machine-cut double helical gear wheels, bevels, racks, and pinions, and points out the great advantage of this construction over the use of straight teeth as regards quietness and absence of wear. Messrs. Citroën have designed special automatic machinery by which double helical gearing can be cut in one operation in the solid, thus avoiding the unsatisfactory system of bolting the two halves of the wheel together.

THE "A.E.G. ZEITUNG."—The monthly periodical under this title, which has been issued as an internal publication by the Allgemeine Elektricitäts Ges. of Berlin for over ten years, is from this month onwards being given a somewhat wider circulation, and we have been favoured with a copy of this month's issue. Among the subjects dealt with are the A.E.G. marine turbine, the proposed electric railway between Cologne and Düsseldorf, the power stations of the Victoria Falls and Transvaal Power Co., and electric power in agriculture. The pamphlet is well illustrated, and contains, besides the above, numerous short articles on matters of electrical interest.

LIGHTNING ARRESTERS.—A booklet from Messrs. C. Schniewindt, of Neuenrade, Westphalia, describes the N.E.G. system of lightning protection for overhead lines. In this system advantage is taken of the fact that lightning discharges will not easily pass round sharp corners in a conductor. The live wire is therefore given a zig-zag form, and a spark gap of the usual pattern, provided with horns, is placed at each of the bends where there is the greatest tendency for the discharge to leave the wire rather than follow round the bend. This arrangement is found to have the advantage that larger air gaps can be employed. Illustrations are given of several forms of the apparatus, which is in extensive use in the Eastern Alps.

FLAME ARC LAMPS.—New leaflets from the General Electric Co. give the latest prices and particulars of the "Angold" magazine flame arc lamp, which was fully described in ELECTRICAL ENGINEERING, Feb. 4th, page 109, and also the new "Flamgold" gravity feed double carbon flame arc lamp.

"THE CONTRACTOR'S HANDBOOK."—This is the title of a very useful publication just issued by the General Electric Co. It consists of four recently issued booklets or miniature catalogues relating to bells and indicators, telephones, switches, cutouts, and accessories, and "Geekoduct" conduit respectively. These are bound together to form a convenient pocket book.

SWITCHGEAR AND ACCESSORIES.—We have received from the Switchgear Co., Ltd. (J. G. Statter & Co.), a collection of leaflets dealing with several interesting features of their switching apparatus. The principle of the Statter patent time lag is gone into, and it is shown how this meets the important requirement of preventing movement until the required time without retarding it after it has commenced. The articles listed include knife switches, switch fuses, and Statter's well-known circuit breakers in several forms, both with auxiliary carbon and copper breaks, and with magnetic blow-out. Motor starters and motor-starting panels are also dealt with, and among the other items in the lists may be noted magnetic blow-out fuses and insulated box spanners.

DRILLING MACHINES.—A leaflet from Mr. John W. Perrin, of Lord Street Engineering Works, Leeds, describes several patterns of belt-driven drilling machines, ranging from small bench machines drilling up to 5/18 in. to substantial machines complete with countershaft drilling up to 1 in.

GEARING.—A useful book, containing a considerable amount of information relating to worm reduction gears, is being issued by Messrs. David Brown & Sons, of Huddersfield. Illustrations of a number of forms of this gear, as made by the firm, for various purposes are included, and diagrams, formulæ, and tables relating to their correct design are given. Particulars of Spence's patent centrip gear, already noticed in this column, are also given, as well as of raw hide, paper and metal spur, helical and bevel gears.

TANTALUM CANDLE LAMPS.—Messrs. Siemens Bros. Dynamo Works (Lamp Dept., Tyssen Street, Dalston, N.E.) have sent us a leaflet, which, in addition to containing a list of the 200-volt tantalum lamps referred to on an earlier page of this issue, gives particulars of tantalum candle lamps for 24 to 40 volts in two sizes: 5 c.p., with bulbs 3½ in. long by 1⅜ in. diameter, and 10 c.p., with bulbs 4 in. long by 1⅜ in. diameter. These are listed at 2s. each.

A NEW WIRING SYSTEM

10/- a point.

MESSRS. SIEMENS BROS. & CO., LTD. (Caxton House, Westminster, S.W.), are introducing a new system of house wiring to meet the demand for a cheap and efficient method of wiring, which has been steadily growing since the introduction of metal filament lamps. From the description which follows it will be seen that the erection of the wires can be carried out very cheaply, and, in fact, it is claimed that good work can be done at as low a price as 10s. per point.

The wires are insulated with vulcanised rubber of a grade corresponding to that of the Cablemakers' Association, and are tested to 1,000 volts. Above the ordinary rubber tape which surrounds the vulcanised rubber, a thin sheath of brass or tinned copper is wrapped in place of the usual braiding. For inexpensive surface work the "Kuhlos" wires, made under a patent of F. Kuhlo, are supplied. The method of covering is illustrated in Fig. 3. This represents a twin sixteen wire, but the material is also made in single wires. The brass sheath is wrapped closely round the insulation and compressed. In the case of the twin sixteens illustrated, the outside diameter is about 0·41 in.; the outside diameter of the single eighteens is only 0·195 in., and of the twin eighteens 0·36; and the single and twin 3/20 have external diameters of about 0·23 and 0·45 in. respectively. On account of the joint this is recommended only for surface work in dry situations, but another pattern of wire, "Stannos," is claimed to be watertight and suitable even for concealed work if used with suitable boxes. For surface work this "Stannos" wire presents a very neat appearance on account of its small diameter.

A 3/20 wire is shown full size in Fig. 1. It is doubly taped beneath the sheath, and its outside diameter is 0·208 in. With a single tape the outside diameter is only 0·196 in., and the overall diameters of single-taped single eighteen and sixteen respectively are 0·16 and 0·178 in. In this case the sheath is of tinned copper, wrapped twice round tightly in such a way that there is only one longitudinal seam, on the outside, and the two layers are sweated together. This wire is made under the patents of Messrs. Handcock, Dykes, and others. Twin wires are not made in this pattern.

Fig. 2 shows the simple and neat method employed for leading the wires into the surface wood-block for the attachment of an ordinary fitting in such a way as to ensure metallic continuity of the sheath. The plate shown in the illustration is fixed on to the wall, and the circular clamping piece is held down on to it by a square nut. The wire is thus clamped down tightly, and the splits on the clamping piece provide sufficient spring to prevent it from damage and yet make a tight contact. Single wires or two or three wires together can be clamped down equally well. A hollowed wooden block of the same diameter as the metal plate is placed over the plate and clamp, and the central screw of the plate passes through a hole in it, the block being fastened down to the plate by the screw-headed nut seen in Fig. 2. The metal block and clamping-piece, screws, &c., are "sherardised" to prevent corrosion.

All the illustrations are full size.

Both wires are supplied in 55-yard coils, and they can be bent by hand without difficulty; the only precaution to be taken is not to bend them too sharply so as not to crack the sheathing, which is, of course, not so pliable as lead. There is no difficulty in removing the sheathing with a knife when trimming the wires for insertion into the fittings. Owing to the conducting sheath, the "Stannos" wire can be employed as a return conductor, so that buildings with independent generating stations or installations connected to the supply mains through ordinary double-wound transformers can be wired with single wire and the lower end of the sheathing earthed.

A special form of "buckle" clip (Figs. 4 and 5) is made for fixing the wires to the walls. The illustrations are self-explanatory.

For concealed work and for absolutely watertight surface wiring "Kalkos" boxes are used, into which the wires are soldered. Messrs. Siemens Bros. & Co. also supply these boxes, and also the tinned "Kalkos" tubes for those cases in which a drawn-in system is required.

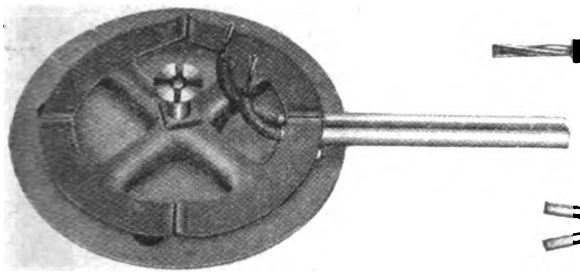

Fig. 2.—Metal Plate and Clamping Piece to go behind Wood Block.

Fig. 1.—3/20 "Stannos" Wire.

Fig. 3.—"Kuhlos" Twin Wire.

Fig. 4.—Buckle Clip for One Wire.

Fig. 5.—Showing Method of Attachment of Buckle Clips.

"The Electron."—The March issue of the Siemens Stafford Magazine opens with a portrait of Mr. T. E. Ingoldly, assistant manager at the works. The technical interest of the number centres in an article by Mr. W. E. Etheridge on press tools, which contains many evidences of the author's long experience with this class of work. Mr. Catterson Smith contributes an article on the engineering applications of gyrostats, and among the reports of the proceedings of the various societies, &c., connected with the firm is an account of a dinner of an association rejoicing in the delightful name of "Ye Boosters."

Electric Goods Vans on the North-Eastern Railway.—The North-Eastern Railway has recently taken into use on its electrically-worked lines near Newcastle, a new electrically-driven parcel and fish van for express service, which is the only vehicle of its kind in the country. According to the *Railway Gazette*, the couplings and buffers are arranged so that it can be coupled up either to steam or electric trains. The equipment comprises four 125 h.p. traction motors of the G.E. 66 type, similar to those driving the ordinary passenger coaches, controlled by the latest form of the Sprague Thomson-Houston multiple unit control with automatic acceleration. All cables are asbestos covered, and are run in solid drawn steel conduits, screwed into cast-iron connection boxes wherever junctions are required. A bell mouth is provided where the cables leave the piping, and a rubber washer, making a perfectly tight joint, ensures the conduit being entirely sealed. The van is lighted by six lamps in series. Duplicate signal and route lamps are also installed, arranged on a sliding base, so that in the event of one circuit failing, the duplicate set can be immediately brought into use. The weight of the van in complete running order, but exclusive of its load, is 37 tons 18 cwt. The van was built by the North-Eastern Railway at its carriage works at York, the electrical equipment being supplied by the British Thomson-Houston Co., Ltd., of Rugby.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 1st, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

7,327/08. **High-speed Continuous-current Dynamo.** British Thomson-Houston Co., and F. H. Clough. The field system is constructed like the stator of an A.-C. induction motor, and is provided with shunt and series windings, the series coils occupying slots in the pole face between the slots containing the shunt winding. The armature has a fractional pitch winding, the demagnetising conductors of which correspond in position with the magnetising conductors of the stator series winding. A flat neutral commutating zone, equal in width to the difference between the pitch of the armature winding and the space enclosed by the shunt winding, is obtained. Three claims, five figures.

17,620/08. **Manufacture of Metal Filaments.** W. D. Coolidge. In the manufacture of filaments of tungsten and similar refractory metals, the squirted filament is cut into lengths, coiled, and then baked in a vacuum or hydrogen chamber to remove the binding material. After this treatment the individual filaments are raised to a high temperature by sending current through them, in order to remove the last traces of the binder and to sinter the filament together. A difficulty in this last process was the fact that the filaments could not be connected in parallel, as some would take too much current and burn away, while others at the same pressure would not be properly sintered. To enable a large number of filaments to be sintered simultaneously, the present invention provides for the use of a separate resistance with a high positive temperature-coefficient, such as an iron wire enclosed in a bulb filled with hydrogen, in series with each filament. The pressure can then be raised until every filament is properly sintered, as a low resistance filament will be prevented from taking too much current by the rise in resistance of the corresponding iron resistance. A specially constructed sintering chamber is described. Six claims, eight figures.

24,058/08. **"Twinob" Motor-starting Switch.** A. P., G. C., and P. A. Lundberg. A switch of the "Twinob" pattern, with two adjacent knobs, designed for use with induction motors having auxiliary starting windings. The contact carrying arm and knob connected to the starting circuit return to the "off" position automatically when released. Two claims, eight figures.

331/09. **Starter for A.C. Motors.** Siemens Bros. Dynamo Works, Ltd., and E. Schupp. Starters for polyphase induction motors are sometimes fitted with an overload release and a ratchet device connected to the same for preventing the rotor resistance from being cut out too quickly. The overload release is generally set to operate at about 50 per cent. overload, but it is permissible to allow a larger current at starting. To enable this larger current to be taken without operating the ratchet device, the current coil is subdivided and the sections connected to a stator switch, interlocked with the rotor resistance switch in such a way that only a portion of the coil is in circuit while starting. A larger current is then required to operate the ratchet device. Two claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Dossetter [Coupling wires] 9,304/08; British Thomson-Houston Co. (*Allgemeine Elektricitäts-Ges.*) [Power transmission systems] 14,161/08; Felten & Guilleaume Lahmeyerwerke Akt.-Ges. [Insulating tubes for transformers] 19,574/08.

Dynamos, Motors, and Transformers: Sir W. G. Armstrong, Whitworth & Co., and Harlow [Motor control] 7,811/08; Johnson & Phillips, Ltd., and Paterson [Motors] 12,650/08.

Electrometallurgy and Electrochemistry: Cowper-Coles [Production of electrotypes] 9,698/08.

Ignition, Electric: Lamkin, Crofts, and Beazley [Testing apparatus] 8,289/08.

Instruments and Meters: Drysdale [Potentiometer for A.-C. and D.-C. measurements] 27,140/08; Zipplies [Motor meters] 636/09.

Storage Batteries: Craig [Portable charging sets] 5,440/08.

Switchgear, Fuses, and Fittings: Long [Electric light fittings] 5,681/08; Thomas [Automatic sign switch] 5,849/08; Gerhardt [Automatic switch] 5,879/08; Baron [Suspension device for lamps] 6,059/08; Hodgson [Charge and discharge switch for accumulators] 6,187/08; Brown [Automatic sign switch] 7,004/08; Richardson [Signs and sign switches] 9,008/08; Schattner and Amberton [Motor controllers] 13,078/08; Conrad [Relays] 24,192/08.

Traction: Christian [Current collectors] 5,686/08; Gros [Lighting and heating of vehicles] 6,228/08; Kinsella and Hodgetts [Alarms for tramcars] 6,432/08; Warner and Holbrook [Anchors for rails] 11,376/08; Cremer [Removing rail corrugations] 20,205/08; Miller [Train control systems] 21,482/08; Gruenwald [Protective device for tramcars] 25,426/08.

Miscellaneous: Herrde [Bells] 27,457/07; Gin [Singeing textile fabrics] 5,856/08; Siemens & Halske Akt.-Ges. [Fire-alarm signalling systems] 15,118/08; Marks (*Soc. Anon. Italiana & Ansaldo, Armstrong & Co.*) [Electric control of ordnance] 15,660/08; Keith and Tuson [Valve-controlling device] 19,109/08; Melvin [Signalling apparatus] 19,499/08; N. Jacobsen's Elektriske Vaerksted [Signalling system] 21,659/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Coleman [Railway signalling system] 18,670/08; Peukert [Production of high-frequency oscillations] 4,762/09; Allgemeine Elektricitäts Ges. [Protective devices for A.-C. systems] 5,717/09; Wirth and Beck [Distant control of machines] 5,811/09; Moser [A.-C. machines] 6,103/09; Allgemeine Elektricitäts Ges. [Generators, motors, and transformers] 6,312/09 and 6,313/09.

Opposition to Grant of Patents

Opposition to the grant of the following patent has been entered.

5,040/08. **Metal Filaments.** F. J. Planchon. An aqueous or alkaline solution of an albuminoid substance is mixed with an alkaline solution of a sulphide of tungsten or sulpho-tungstate. Diluted hydrochloric acid is added, and a precipitate consisting of a compound of metallic sulphide and the albuminoid substance is obtained. After washing, this mixture is made into a paste with water and squirted into a diluted acid solution.

The right to a patent on the following application has been surrendered.

15,079/08. **Metal Filaments.** H. Aron and A. Geiger. A process of decarbonising metal filaments by heating them to incandescence in an atmosphere of water vapour of definite density. (See Electrical Engineering for November 19th, 1908: Vol. IV., page 675.)

Expiring and Expired Patents

The following patent expires during the current week after a life of fourteen years:—

7,458 of April 11th, 1895. **Electrolytic Apparatus.** C. Kellner. Mercury cathodes are employed, and the decomposing cells are arranged either in series or in parallel. The amalgam formed is led off by pipes into forming cells, where it is decomposed. The forming and decomposing cells are quite separate. The forming cells are connected in series, and may be supplied with current if the decomposition of the amalgam is difficult.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, Motors, and Transformers: R. Belfield (*B. G. Lamme*) [Balancing magnetic circuits of lap-wound machines] 28,736/96; British Thomson-Houston Co. (*E. W. Rice*) [Compounding alternators and rotary converters] 29,585/97; British Thomson-Houston Co. (*W. S. Moody*) [Arrangement of transformer coils] 29,586/97; A. P. Wright and A. H. Midgley [Double-armature machine for variable speeds or pressures] 27,506/05.

Ignition, Electric: A. M. Duckham [Gas burners] 27,497/03.

Instruments and Meters: E. A. Carolan (*General Electric Co., U.S.A.*) [Bearings for meters] 27,753/02.

Switchgear, Fuses, and Fittings: J. B. Belcher [Lamp-holder with universal joint] 22,910/00; J. Sachs [Combined switch and fuse] 25,747/01; E. A. Carolan (*General Electric Co., U.S.A.*) [Oil-break switch with overload relay] 27,771/02; Electric & Ordnance Accessories Co., E. C. Astington, and R. F. Hall [Control of lighting circuits] 27,849/02.

Telephony and Telegraphy: H. H. Lake (*J. S. Stone*) [Wireless telegraphy] 27,739/02, 27,742/02, 27,746/02, and 27,781/02; J. Schiessler [Microphone sound-locating apparatus for ships] 27,674/03.

Traction: British Thomson-Houston Co. (*A. H. Armstrong*) [Motor-operated controllers for three-phase equipments] 23,104/00; A. J. Boult (*W. J. Richards*) [Control of compressor motors for air-brake systems] 25,560/01; W. M. Brown [Surface-contact system] 28,031/02; O. Lökken [Destination indicator] 28,096/02; G. Gibbs [Safety device for third-rail systems] 27,924/03.

Miscellaneous: W. G. Todhunter [Speed indicator] 27,874/02.

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

About 200 drivers and conductors upon the London United Tramways system refused to take out their cars on Monday morning, in an effort to force upon the company certain claims in regard to hours, and also the recognition of their trade union. The company, however, had no difficulty in filling their places. Although the men still out consider a "strike" is proceeding, the company take no notice of the affair and decline to re-engage any of the "strikers." (Page 341.)

For the second time this year the flow of water of Niagara Falls is stopped by frost. Considerable damage to the power stations is expected should the thaw be rapid. (Page 341.)

Among the Papers read at the last meeting of the Physical Society were two relating to wireless telegraphy. In one, Dr. J. A. Fleming and Mr. G. B. Dyke described a method of testing receivers in the laboratory; and another, by Dr. Fleming and Mr. H. W. Richardson, described experiments on the effect of an air blast upon the spark discharge. (Page 342.)

Some tests of an electrically-driven mine fan show an overall efficiency of 76·6 per cent. when taking about 400 h.p. (Page 342.)

In a description of the electric power equipment of a large ring doubling cotton mill in the Manchester district, some particulars are given of the nature of the machinery to be driven and the motor switchgear, &c., employed. Current is taken from the mains of the Manchester Corporation, and induction motors are used throughout. (Page 343.)

A communication from Mr. C. C. F. Monkton describes an interesting case of a lightning discharge, showing a preference for a copper path rather than a course along an iron pipe of approximately equal ohmic resistance. (Page 346.)

The following books are reviewed in this issue:—"Transformers for Single and Multiphase Currents," by Gisbert Kapp; "The Practical Engineer: Electrical Pocket-Book and Diary for 1909"; "Fowler's Mechanical Engineer's Pocket-Book, 1909"; and "Electric and Petrol-Electric Vehicles," by W. Poynter Adams.

A letter from Mr. L. H. Walter deals with wireless telegraphy at sea, and Mr. Béla Gáti has written to us on the same subject. We also publish a letter from Messrs. Krupka and Jacoby with regard to agencies for the sale of tantalum lamps. (Page 348.)

At the annual general meeting of the Manchester Section of the Institution of Electrical Engineers, in addition to the ordinary business three short Papers were read. In these Mr. A. W. Gibson described some tests of suction gas plant, Mr. W. Makower gave results of investigations made with kites of the electrical state of the atmosphere, and Mr. W. A. Harwood proposed a new standard of light. (Page 349.)

An interesting demonstration of trunk telephone working was given by Mr. F. Tremain, Superintending Engineer of the Northern District of the Post Office Telegraphs, at a meeting of the Newcastle Section of the Institution of Electrical Engineers. He emphasised the effect of underground lines in reducing the maximum speaking distance on a telephone circuit, and said that the extension of the Continental service in England was not possible until the intervening municipal bodies waive their objections to having overhead lines passing through their towns. (Page 351.)

The works of the Chichester Electric Light & Power Co. will shortly be opened. This is one of the first electricity works relying entirely on Diesel oil-engines. —A water-power electric transmission scheme is being promoted in Bombay for the supply of electrical energy to cotton-mills and other consumers in the district.—A protest has been made to the Board of Trade with regard to the proposed terms for the transfer of the Southgate Electric Lighting Order to the North Metropolitan Electric Power Supply Co.—A flat rate of charging is to be adopted in Torquay instead of the maximum demand system hitherto in use.—The accounts of the Belfast Corporation tramway system for 1908-9 show a net profit of £14,600, of which £13,000 has been transferred to depreciation.—Southwark Bridge is to be widened to take tramway lines. (Page 351.)

An electrical installation is to be fitted at the Abbey (Belfast) Sanatorium at a cost of £4,080. The Bray Council is asking for a loan of £2,000, and the Hornsey Council for £6,000, for electrical extensions. The Keighley Council contemplate an expenditure of £12,250 upon their electrical undertaking. A loan of £1,559 has been sanctioned to the Loughborough Council. (Page 352.)

There is a profit of £19,094 for the year's working upon the Calcutta tramways, and a dividend of 4 per cent. is declared upon the ordinary shares. There is a balance of £15,588 upon the working of the Cuba Submarine Telegraph Co. for the half-year to December 31st. The profits for 1908 of the Canadian General Electric Co. amount to $753,088. (Page 353.)

A Paper by Mr. H. T. Boothroyd read recently before the Liverpool Engineering Society dealt with electrical installations on board ship, especially as regards wiring arrangements and applications of power, including steering gear. A proposed equipment for an electrically-driven dredger was mentioned. (Page 355.)

Under "Electrometallurgy and Electrochemistry" we give an abstract of a recent Paper before the Faraday Society, in which is described a new pattern of furnace designed for tempering metals by immersion in various molten salts. (Page 355.)

An original communication to the Institution of Electrical Engineers by Messrs. C. C. Paterson and E. H. Rayner describes a series of standard non-inductive resistances for the measurement of heavy alternating currents which have been made for the National Physical Laboratory. (Page 356.)

Among the specifications published by the Patent Office on Thursday last was one by F. Harlow and Sir W. G. Armstrong, Whitworth & Co. for the automatic control of the speed of a motor by varying the field of the generator. Relative motion between the motor shaft and an eddy-current brake disc driven through a spring coupling causes a contact to be broken and a resistance to be put in the generator field circuit. A specification by Johnson & Phillips, Ltd., and S. Paterson describes an arc lamp feeding mechanism driven by the weight of a plunger, which is intermittently lifted by a solenoid; and a meter in which friction is compensated for by moving the armature in an axial direction by means of a solenoid in the main circuit is the subject of a specification by A. Zipplies. Among the patents which expire during the current week after their full term of life is one for the manufacture of high-resistance units by deposition of finely-divided silver on porcelain. Others relate to the production of alloys of tungsten, and to printing telegraphs. (Page 357.)

The general complaint among British electrical manufacturers is that "there is not sufficient work to go round." Very few firms are working at their full output, and, in consequence of the keen competition for orders, prices are still cut down so keenly as to leave but little margin of profit. In these circumstances any new outlet is welcome, and although the application of electricity in colliery and general mining work is not new, it is one of the younger branches of the electrical industry in which much extension may be anticipated in the near future. Both British and German manufacturers have realised this, and in this case we trust that our own country will not lag behind, as there is much work to be done both at home and in the Colonies. On the Rand, the A.E.G. Co. of Berlin will be well represented owing to their position in the Victoria Falls and Transvaal Power Co., but although the generating plant is to be made by a German firm, it is to be hoped that the British manufacturing firms will be ready to take their share in supplying the plant for use in the mines themselves. In England, as we have said, much useful pioneer work has been done by German firms as well as British, but the market is an open one, and British plant is as cheap and efficient as any. A useful impetus should be given to electrical work in mines by the new Institution of Colliery and Mining Electrical Engineers, the inaugural meeting of which is to be held in Manchester at the end of next week. This Institution will doubtless help to promote the extension of the application of electricity in collieries, and to familiarise colliery managers and engineers with the important economies that can be effected by electric driving. Full discussions on technical matters should also be of assistance to the manufacturer, and we hope that ultimately the Institution will develop into an important factor in the mining industry not only in our own country but also in our Colonies.

It is a matter for congratulation that the attempt made by the officials of the Amalgamated Association of Tramway and Vehicle Workers to bring about a general strike of the London United Tramway Co.'s drivers and conductors has proved abortive. The men themselves are apparently contented with the general terms of their employment, and the strike which would have ensued had Sir Clifton Robinson, the Managing Director of the company, displayed less firmness, would have had no real object but that of strengthening the position of the Union. It was evidently the

Digitized by Google

deliberate wish of that body to bar the way to any amicable consideration of the alleged grievances, and to precipitate a bitter quarrel between the employers and the employed by paralysing the Bank Holiday service on the holiday lines. Having thus embroiled the men with their employers, the Union would have made its fighting organisation indispensable to them. The men are well paid and are satisfied with their pay; there is, however, a desire that the seventh day which they are called upon to work once a fortnight should be paid for at time and a quarter instead of at ordinary wages. But no one can sympathise with any association of workmen which, instead of submitting a request for such a concession in the ordinary manner, orders a strike on a day of maximum traffic.

ARRANGEMENTS FOR THE WEEK

SATURDAY, APRIL 17TH.

Birmingham and District Electric Club.

7 p.m. Meeting at the Battery Room, Summer Lane Power Station of the Birmingham Corporation. Paper to be read:—"Electric Welding," by V. D. Green, with practical demonstrations.

TUESDAY, APRIL 20TH.

Junior Institution of Engineers.

7.30 p.m. Meeting at the Royal United Service Institution, Whitehall. Paper to be read:—"Systems of Electrical Power Distribution," by C. H. Smith.

WEDNESDAY, APRIL 21ST.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. Meeting at the University. The following Papers will be read:—(1) "Manipulation of Telephone Dry Core Cables," by F. G. C. Baldwin. (2) "Improvement of Power Factor in Alternating Current Systems," by Miles Walker.

"Dynamicables."

7.30 p.m. Anniversary dinner at the New Gaiety Restaurant, Strand. The anniversary meeting will be held at 7 p.m.

Institution of Electrical Engineers: Students' Section.

7.30 p.m. Meeting at 92 Victoria Street, Westminster, S.W. Paper to be read:—"Sewage Pumping Electrically of a Small Town," by J. S. Lazarus.

THURSDAY, APRIL 22ND.

Institution of Mechanical Engineers.

7.30 p.m. Anniversary Dinner at the Hotel Cecil.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster, S.W., when the discussion on Mr. Rider's Paper, "The Electrical System of the London County Council Tramways," will be concluded.

FRIDAY, APRIL 23RD.

Physical Society.

5 p.m. Meeting at the Imperial College of Science, Imperial Institute Road, South Kensington. Agenda:—(1) "On a Want of Symmetry shown by Secondary X-Rays," by Prof. W. H. Bragg, F.R.S., and J. L. Glasson. (2) "Transformations of X-Rays," by C. A. Sadler. (3) "Theory of the Alternate Current Generator," by Prof. T. R. Lyle.

Institution of Mechanical Engineers.

8 p.m. Annual General Meeting at Storey's Gate, St. James's Park, London, when Mr. J. A. F. Aspinall will deliver his Presidential Address.

Institution of Civil Engineers: Students' Section.

8 p.m. Meeting at 25 Great George Street, Westminster, S.W. Paper to be read:—"The Development of Hydro-Electric Power Schemes, with Special Reference to Works at Kinlochleven," by J. M. S. Culbertson.

Royal Institution.

9 p.m. Evening Discourse by Mr. Alexander Siemens on "Tantalum and its Industrial Applications."

SATURDAY, APRIL 24TH.

Institution of Colliery and Mining Electrical Engineers.

5 p.m. First ordinary meeting at the Grand Hotel, Manchester. A cordial invitation is extended to all interested in electrical and mining matters. The chair will be taken by Mr. W. Maurice, General Manager of the Hucknall Colliery Co., Ltd.

FREEZING OF NIAGARA

FOR the second time this year the Niagara River has become frozen to such an extent that the flow over the famous fall is practically stopped, and the situation is a serious one from the point of view of the large power stations taking water from above the falls. The estimated combined loss to the companies is given by the correspondent of the *Daily Telegraph* as £250,000. Not only does the shortage of water and the consequent cessation of supply of power for power lighting and traction affect the neighbouring towns to a very considerable extent, but there is also risk of great damage being done to the works themselves, especially if the thaw is rapid. Elaborate precautions are always taken in American and Canadian water-power stations against floating ice and against choking of the intakes and injury to the wheels themselves; but the liberation of the huge masses of ice collecting above Niagara is capable of doing enormous damage to the headworks of the supply stations as well as to the steel bridge across the river. The freezing of the falls is of very rare occurrence, and, with the exception of February of this year and March, 1903, has not taken place since 1848.

LONDON UNITED TRAMWAYS

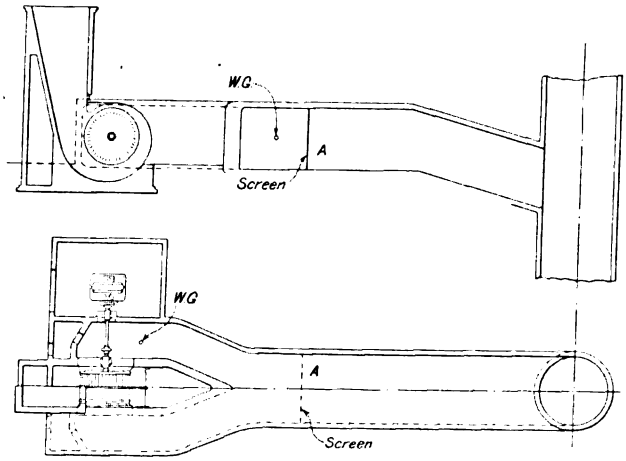
Strike Averted

IN consequence, it was said, of a resolution passed at a meeting of employees of the London United Tramways, Ltd., on Saturday, about 200 drivers and conductors refused to take out their cars on Easter Monday morning. As a matter of fact, however, the full service of cars was in no way interfered with, a sufficient number of relief men being available to fill all the vacancies. Sir Clifton Robinson, the managing director of the company, informed the staff that the absentees had dismissed themselves, as they would not again be employed by the company. The extent to which the strike movement was popular may be judged when it is stated that there are about 1,250 men in the employ of the company, and only about 200 struck work. The objects of the so-called "strike" were to secure the recognition by the company of the Amalgamated Association of Tramway and Vehicle Workers, a revision of the number of hours of working per day, a weekly "rest" day, and time and a quarter for all work on "rest" days. Some of the men who did not "strike" are members of this Society, and complaints have been made at the way in which the affair was forced upon the men against their wishes. As it was, a very large number of the men who did not turn up on Monday morning put in an appearance at the depôts during the day, and were reinstated. There was some rowdyism at various points of the company's system, but no difficulty was experienced in maintaining a full service of cars. The company rewarded the men who remained loyal with an extra day's pay. From statements made on both sides, it would appear that if there are any real grievances between the men and the company they could easily be settled by friendly discussion, to which the company is agreeable, but the intervention in these discussions of the trade union is emphatically objected to by Sir Clifton Robinson.

Electric Ambulances in the City of London.—The Police Committee of the City Corporation will shortly put a second electrically-driven ambulance into service. The ambulance at present in service is housed at St. Bartholomew's Hospital, which is rather too far away for dealing promptly with accidents in the Bishopsgate district. It is considered that two vehicles will meet all the requirements of the City. A full description of the ambulance and call system was given in ELECTRICAL ENGINEERING for April 11th, 1907, Vol. I., p. 653.

Wireless Telegraphy and Telephony.—The proposal to control the supply of fish to the markets by arranging for wireless telegraphic communication between the trawlers and the home port is being seriously discussed at Hull. As the area of operations is very large, it is thought that the only practical use would be to ships working near home, to hurry them back to supply a scanty market.

It is stated that a series of experiments are being carried out by Lieutenant Loring, inspector of wireless telegraphy to the Post Office, with regard to communication with islands lying off the mainland and other places where natural difficulties make the cost of cable communication excessive.



Some successful experiments in wireless telephony between the Eiffel Tower and Mélun, a distance of 50 km., were made on Monday, in the presence of M. Picard, the Minister of Marine.

The Ceylon Government is said to be considering the installation of a wireless service between Colombo and Minicoy to link up Ceylon with the Laccadive and Maldive Islands, as well as to communicate with ships in the Indian Ocean.

TEST OF AN ELECTRICALLY-DRIVEN MINE FAN

A TEST was recently made of a "Sirocco" mine fan, manufactured by Messrs. Davidson & Co., Ltd., of Belfast, and installed on the No. 6 Pit of the Glamorgan Coal Co., at Llwnpia. The trial was carried out under the personal supervision of the general manager of the company, Mr. Leonard Llewellyn, with instruments carefully calibrated for the occasion. The fan is of the double inlet type, 11ft. 8in.

Elevation and Plan showing Arrangement of "Sirocco" Fan and Positions of Water Gauge.

in diameter, and is direct-coupled to a three-phase motor manufactured by the British Thomson-Houston Co., of Rugby. The figures given represent the average of three tests:—

Speed of fan and motor	183 r.p.m.
Watergauge in fan drift	6 in.
Watergauge in main drift	6 in.
Average velocity of air	1,842 ft. per min.
Area of drift	184·6 sq. ft.
Volume of air	340,033 cub. ft. per min.
H.p. input at motor	420 h.p.
Efficiency of motor	93 per cent.
B.h.p. on fan shaft	390.
I.h.p. in air	321·5.
Mechanical efficiency of fan ...	82·43 per cent.
Combined efficiency of fan and motor	76·6 per cent.

The accompanying sketches show clearly the position of the watergauge, as well as that of the screen (A), where the air measurements were taken. It is worthy of notice that the fan was capable of maintaining the watergauge in the drift when running at the low peripheral speed of 6,705 ft. per minute.

THE PHYSICAL SOCIETY

Two Papers on Radiotelegraphy

AMONG the Papers read at the meeting of the Physical Society, on March 26th, was one by Dr. J. A. Fleming and Mr. G. B. Dyke on the "Production of Steady Electrical Oscillations in Closed Circuits, and a Method of Testing Radiotelegraphic Receivers." It was pointed out that there is great difficulty in conducting comparative tests of receivers in actual radiotelegraphic stations, but owing to the small radiative property of closed circuits, the authors pointed out that by the use of two such circuits, one being employed as a transmitting station and the other as a receiving station, at a distance of a few hundred yards, what is practically equivalent to stations with open oscillators at very large distances, can be constructed. Methods were described for producing in one of the closed circuits extremely constant damped oscillations by means of an induction-coil or transformer, a spark-gap on which a steady jet of air is allowed to impinge, and a suitable mercury break. The receiving circuit consists of a square circuit of insulated wire which is pivoted in such a manner that it can be turned in any direction, the angular deviations being measurable on scales. This circuit is joined in series with a condenser of variable capacity, and with the oscillator-detector to be tested. If the oscillation-detector is of the current-actuated type, it is placed in series with the condenser, if of the potential-actuated type, it is placed across the terminals of the condenser, being associated with a shunted cell and telephone if necessary, or with a telephone simply, if a magnetic detector. It is then possible to set this receiving circuit in such a position that it has no current induced in it by the oscillations in the transmitting circuit; but on turning it through a certain angle, sounds are heard in the telephone indicating the production of oscillations in the secondary circuit. The angle through which it is to be turned is a measure or indication of the sensibility of the detector. A self-acting apparatus was also exhibited for sending messages or signals by a punched tape.

A Paper was also read by Dr. J. A. Fleming and Mr. H. W. Richardson on the "Effect of an Air Blast upon the Spark Discharge of a Condenser charged by an Induction Coil or Transformer." When an oscillatory discharge of a condenser takes place across the spark-gap in the usual manner by charging the condenser by an induction-coil or transformer, the intermittent spark which takes place is a complex effect. It consists partly of a true condenser discharge and partly of an alternating-current arc due to current coming directly out of the induction-coil or transformer. This arc discharge is a source of difficulty in making accurate quantitative measurements with electrical oscillations, and to produce a uniform oscillatory discharge this true arc discharge must be prevented or arrested. It was shown in the Paper that this can be done by a regulated air-blast produced in any convenient manner, thrown upon the spark-gap, provided that the spark-gap is small. As a proof of the advantages to be obtained from this arrangement a number of measurements were given of the decrement and spark-gap resistances of various circuits measured with the Fleming cymometer, both with and without the air-blast upon the spark-gap. It was shown that the observations were more regular and the resonance more accurately delineated when the spark-gap was so treated with an air-blast. The Paper also described experiments made to investigate the effect of breaking up the spark-gap into smaller spark-gaps in series, both when the gaps were subjected to an air-blast and also without the air-blast. It was shown, up to a certain length of gap, about two millimetres in the case of this experiment, that the air-blast had a very decided effect in increasing the mean square value of the discharge current, and also that a similar effect was produced by dividing up the spark-gap into smaller spark-gaps in series, provided that the total spark-gap was not increased beyond a certain limit. This increase appears to be due to the suppression of the arc discharge, as shown by the appearance of the image of the spark in a revolving mirror. With regard to multiple spark gaps, the general result, however, appears to be that beyond a small limit in length, about three millimetres, nothing is gained by breaking up the spark-gap into spark-gaps in series, or by subjecting the spark-gap to an air-blast.

Institution of Colliery and Mining Electrical Engineers.—The first general meeting of this Institution will be held at the Grand Hotel, Manchester, on Saturday, April 24th, at 5 p.m. Mr. W. Maurice, general manager of the Hucknell Colliery Co., Ltd., will take the chair, and Mr. J. R. Salter will be vice-chairman. The secretary will present a full report on the progress of the Institution, the reasons for its formation, and its future intentions. We published an article in our last issue stating the objects of the Institution, and a draft scheme of its organisation. A cordial invitation to the meeting is extended to all interested in colliery and mining matters. The Honorary Secretary (*pro tem.*) is Mr. J. Williams, 3 Moresby Parks, Whitehaven.

Electric Traction on the German State Railways.—Although the conversion of the whole of the Magdeburg-Leipzig-Halle section of the Prussian State railways has been postponed for a time, the Government has decided to commence at once the equipment of a short portion of that section, namely, that between Dessau and Bitterfeld, for electric traction on the single-phase system, so that experiments can be made in the meantime. This preliminary work is for the purpose of arriving at a standard form of equipment, and of giving some idea of the staff that will be necessary. It is stated that one of the causes of the delay in the equipment of the whole section is that the military authorities are not yet certain that the new conditions will satisfy all their requirements. The total cost of the conversion of the whole section is estimated at £1,300,000, which includes the cost of the electric locomotives. With regard to the electrification of the railways in Bavaria, representatives of the Government of that State have been conferring with the authorities in Berlin as to the advisability of introducing electric traction on certain lines which are considered important from a military point of view. It will be remembered that one of the lines which were to be equipped at an early date was that from Freilassing to Berchtesgaden, and that power for that line was to be obtained from Saalach Falls. It is now stated that further investigation has proved that the cost of the water-power plant would render the economy of electric traction doubtful, and that it is also by no means certain that the Government would be able to make use of the surplus power.

ELECTRICAL DRIVING OF A RING DOUBLING MILL

IT is only to be expected that as Manchester is the centre of the cotton industry of the world, the Manchester Corporation Electricity Department has of recent years had a considerable amount to do with the application of electric power to the driving of cotton mills. Through the courtesy of Mr. S. L. Pearce, the City Electrical Engineer, we are enabled to give a description of a recent installation of electricity to drive a cotton doubling mill, which, if we were permitted to mention the name, would be at once recognised as belonging to one of the foremost firms in this branch of the industry. As this installation is typical of a considerable number of other drives it may be interesting to describe it somewhat in detail; but for the benefit of such readers as are not intimately acquainted with textile industries, it may be worth first mentioning that the cotton industry is highly sectionalised; one branch devotes itself to the spinning of a single twisted thread from the raw cotton with suitable processes of cleaning, scutching, carding, drawing, &c. This single thread is in itself too weak to stand much tensile strain although it is made up in various counts, the count being the measure of weight of a standard length of thread when made up in its single twist. Another section of the industry may take up the work of bleaching the thread, another takes the spun thread as its raw material, and by a process of doubling two, three, four, or any other number up to six, or even more folds of thread, produces the commercial stranded lace, sewing cotton, or other thread with which we are familiar. Another branch of the cotton industry may also take the thread either in a bleached or unbleached condition and weave it into cotton cloth of a bleached or grey nature, and then still other factories bleach, dye, mercerise or print upon the material. The particular section of the industry which we are at present describing is that devoted to the twisting of two or more threads together into a stranded cotton thread, and this is technically known as "doubling."

Two classes of textile machines are used for this purpose, one being known as the twiner doubling frame, which system involves the continual stopping and starting of the machinery, the other being a continuous process called the ring doubling frame, which produces a very even thread, there being less liability for the yarn to show any variation of twist than in the use of the twiner. The chief seat of the cotton-spinning industry using American cotton is at Oldham, while at Ashton coarse and medium counts of Egyptian and American are spun, while the finest counts of Egyptian and Sea Islands are spun at Bolton and in the region of Ancoats, Manchester. The process involves a very constant drive in order to produce uniformity of twist in the doubling, and it is claimed that this is most effective where electric drive is used, while another great advantage which electricity has over its older rival (steam) is that, apart from the periodic speed fluctuations of the steam-driven engine and the loss of power and speed produced by the slip on the belts, there is sometimes a considerable amount of time lost in starting up the main engine driving the mill. In the particular case cited, steam is now only used for heating purposes, and a supply of electric power is brought to the works at a pressure of 6,500 volts on a three-phase 50-period supply. The high-tension board constructed by Messrs. Eckstein, Heap & Co., of Manchester, is located in a spare room of the mill, and contains a main feeder panel of a capacity up to 150 amperes, carrying overload relays, ammeter and voltmeter, and an oil-break switch. Three transformers are installed, each of 250 kw. capacity, for the power supply, and the board contains three transformer panels, each containing an Eckstein Heap extra oil high-tension break switch, of the pattern shown in Fig. 1, with overload automatic release features on each phase, and three-pole time limit relays. The various instruments and switches are mounted on sheet steel plates placed in front of artificial stone work cells. The high-tension bus-bars are mounted in separate stonework chambers at the top of the board, the whole of the high-tension apparatus being enclosed by expanded metal collapsible gates. The low-tension board, by the same firm, is arranged at right angles to this, so as to form an enclosed space for the transformers, and consists of a number of enamelled slate panels mounted on angle steel framework. A panel for each of the transformers is provided, containing a three-pole "Waverley" knife switch, and a "Noark" fuse on each phase, and an ammeter, voltmeter, and wattmeter. A lighting panel is also provided for the works, the pressure being 210

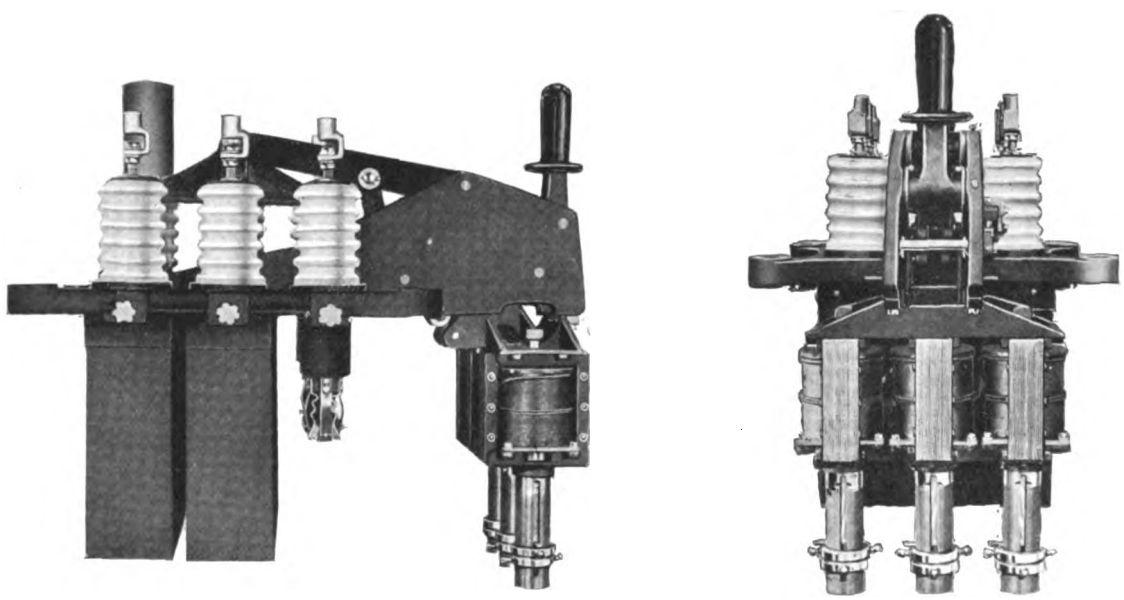

Fig. 1.—High-Tension Feeder Switches.

Digitized by Google

volts from each phase wire to neutral. The board contains a switch for the sub-station lighting, a three-pole mechanically connected main lighting switch fuse on each phase, and a lighting meter. It will be noticed that both for lighting and power the units are metered on the low-tension side.

Coming to the machinery for treating the cotton, the process is as follows:—The yarn comes into the works as single thread from the spinners, having been spun into cops about 8 in. long and 1 in. diameter tapered at the ends. The cops are then "skewered," or placed on upright prongs on a stop motion winding machine, made by Messrs. Joseph Stubbs, of Manchester. These series of prongs are arranged in a long line near the floor on this frame. The thread then passes upwards from the skewers over a tension device consisting of a long pad of flannel, on which the cotton drags slightly to give it tension and then passes to a series of horizontal bobbins resting on iron drums arranged on a traverse frame, which gives a moderately slow traverse reciprocating motion to the yarn in order to spread it evenly in layers on these parallel tubes ready to be sent out, for, say, doubling reeling, or for weaving purposes. The yarn to be wound, either bleached or grey, is placed in the form of hanks on "rices" or revolving structures like the spokes of a wheel, the hank following the rim of the wheel. The thread is led from the rices through a series of grooved teeth to a quick traverse motion which moves the thread of either single or double yarn rapidly backwards and forwards on the tube, spreading it from end to end with a sharp spiral. Successive layers of these spirals build up a tight and compact cylinder of cotton with crossing threads, this being the form in which it will pass away from the bobbin with greatest ease in the warping creel when required for weaving. For weaving purposes, "pirn" winding machines are also installed, the cotton being wound tightly on tubes which fit on a standard spindle, or pirn, this spindle being of the same diameter as that to be found in the shuttle of the weaving machines. On all the above machines, the speed, although maintained constant throughout the run, is varied according to the class of work or kind of thread,

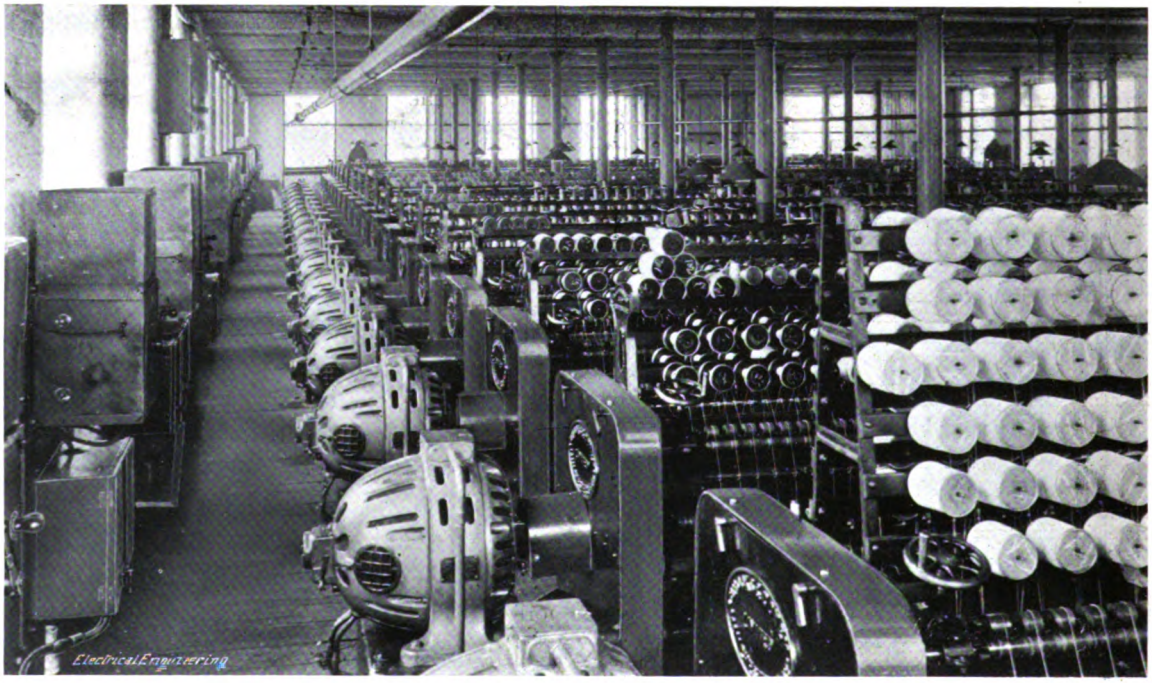

Fig. 2.—Line of Doubling Frames, showing Motors and Starting Gear.

bobbins. Two, three, or up to six threads or ends are drawn from the cops to each bobbin, depending on the number of strands that it is required to run together, and the object of this frame is simply to wind the ends together at an equal tension without twisting them, preparatory to the next process. During the course of its travel from the cops to the bobbins, the thread in each case passes through a loop or drop wire. Should one of the threads break, the drop wire falls down, and comes into contact with a revolving cam roller, causing it to knock the bobbin away from the driving drum turning it. By this means that particular bobbin is stopped until the broken end is tied. These winders are belt-driven from a transverse shaft, which in its turn is driven by a 30 b.h.p. motor running at 578 r.p.m. on a 400 volt supply, made by Messrs. Siemens Brothers Dynamo Works, Ltd. The motor also drives other machines on the same floor, which can now be described.

Some of these machines are called cheese winders, from the appearance of the made-up bobbin when finished, and are for winding from the hank to a spool without heads or ends. The cotton is here wound on by means of speed cones and belting on the counter-shaft.

The next process is that of doubling, on one of the standard doubling machines made by Messrs. Brooks & Doxey, Ltd., of Manchester. The doubler consists of a frame carrying from 450 to 500 bobbins, already wound two or more ends up on the first-named stop motion winding machine, arranged symmetrically on each side. The bobbins are arranged in ranks on the top of the frame, and the threads are drawn from these, then under a glass rod which lies in a water trough. They then pass round two rollers rotating in opposite directions and meeting each other in the same way as a pair of mangle rollers, and the revolution of these draws the thread through it at a constant fixed speed by nipping it. It then passes through a specially shaped piece of steel or brass, termed "the traveller," which rides loosely on the ring surrounding the spindle and bobbin, on the latter of which the twisted thread is wound. The spindle is then rotated rapidly by means of bands connecting the wharves of the spindles to the "tin rollers," through which the motion of this part of the machine is conveyed. The speed of rotation of the spindles on most of the frames is about

Digitized by Google

7,000 r.p.m. The constant revolution of the spindle combined with the fact that the thread passes through the traveller produces a twist in the thread which is proportional to the number of turns of the nipping rollers above mentioned compared with those of the spindle. The speed of the rollers can be varied by means of spur wheel gearing. It is possible, by means of this machine, to double from two to twenty ends into one of twisted thread. In the case which is at present being described, each doubling frame is direct driven by a motor constructed by Messrs. Siemens Brothers Dynamo Works Co., Ltd., who were largely concerned in this electrical equipment, placed on the end of the frame and controlled by Messrs. Eckstein, Heap & Co.'s starting gear. Fig. 2 shows the other end of the line of doublers mentioned above, illustrating the motors and starting gear, which is of the three-phase type illustrated more clearly in Fig. 3. The motors run at 964 r.p.m., while the speed of the

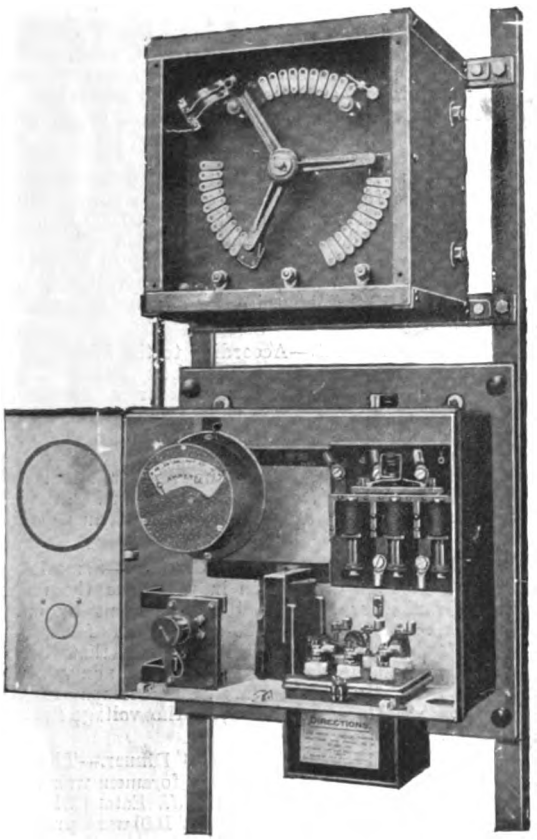

Fig. 3.—Motor-Starting Panels.

spindles twisting the thread varies on different machines, between 5,000 and 8,000 r.p.m. being obtained. It is essential that the speed of each machine shall be as constant as possible, and this therefore provides a very steady load on the electric plant, except at such times when the machines are stopped for the purpose of doffing or taking the full bobbins off the spindles. There is no provision made for stopping each spindle automatically in the event of breakage of one thread or strand, nor is this necessary, inasmuch as two or more threads having been previously wound together, the tension on the combined threads is not sufficient to give much chance of breaking.

Auxiliary machines are found in such an installation, known as clearing frames, upon which the bobbins of doubled yarn are unwound and passed through fine metallic gauges accurately dimensioned to the proper thickness of the twisted or doubled thread. Should there at any spot be excess thickness due to uneven doubling or faulty single yarn, the thread is broken, drawing attention to the irregularity. In preparation for the next process, gassing, where the thread is required to be free from fibre, smooth, and of a good finish, the yarn is wound on a "bottle" bobbin, which winds the thread up into the form of a bottle. It is found that this formation is particularly suitable for rapid unwinding. The thread is then taken to the gassing department, where it is unwound from the clearer bobbins, bottle-shaped, and is passed at a very high speed nine to ten times through a small fan-shaped Bunsen gas jet. This has the effect of singeing the thread, and it is very important for uniformity of product that no draught of air is allowed to interfere with the correct burning of the Bunsen flames. The finer the count passed through the gassing frames, the higher should be the speed at which the thread is drawn through. In this particular plant a 14 b.h.p. motor is installed for several gassing frames of 50 lights on each side of the machine. Electric heating is not employed for this purpose in this particular mill.

It is often the case that plain yarn has to be sent out to weaving sheds or other factories, and in this case it is frequently brought to reeling machines in order to be crossed reeled into hanks. The mechanism of such machines gives a cross-over motion to the thread, so that the hank by means of tying bands can be subdivided into small sections, rendering it easy to run off for making warps, &c., for weaving. The clearing frames and reeling machines require a very small amount of power. This cannot, however, be said of the preparing machines, which are designed to put a gloss on to the yarn by means of pressure and the addition of grease when the yarn comes from the cross reeling machines. Four or eight hanks from the reel are put on the preparing machines, and high speed rollers are provided with a cross-over gear between two sections of the hanks, so that one lot of hanks is run over the top of the other, and back again, at a very high speed. This "prepares" and smoothes out the threads considerably, and with the addition of grease it is found that a run of about three-quarters of a minute is sufficient to give a hank the required glossiness. An automatic knock-off arrangement is provided on these machines, so that after sufficient treatment the drums are flung out of action. In the installation considered, a motor of 14 b.h.p. was provided for running a set of six preparing machines, together with a few reeling machines and clearing frames.

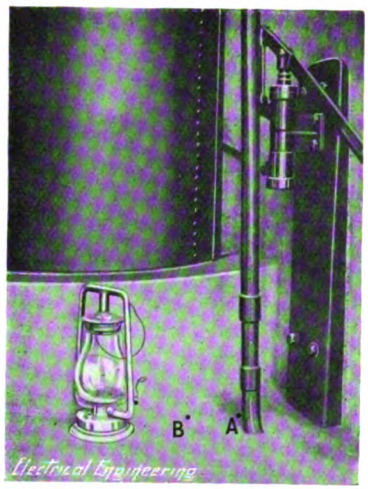
After leaving this set of machinery, it is usual for the threads to be examined under a very strong light for defects by skilled inspectors, and tantalum lamps have been found very useful for this purpose. The hanks are then bundled and pressed ready for the market.

As regards the electrical equipment for dealing with the sub-circuits, the main distribution board, constructed by Messrs. Eckstein Heap & Co., was installed by Messrs. Siemens Brothers Dynamo Works Co., Ltd., dividing the supply first into power and lighting, and next dividing these main sections into sub-sections for the various rooms, where distribution boards for the motor circuits are installed. A point which is of interest in this connection is that time limit relays are relied upon to overcome any faulty variation of the motors, as it is found that a momentary overload is not injurious to alternating current motors, whereas a sudden stoppage of a frame, due to the blowing of a fuse, would produce such inconvenience that in all probability the workers would fuse up the circuits to such an extent that they would be practically unsafeguarded. All feeder and main cables used in the installation are three-core vulcanised, india-rubber insulated, and single steel wire armoured. The cables are supported on the walls by galvanised iron saddles.

Digitized by Google

The cables between the starting apparatus and motors are V.I.R. cables run in gas tubing for protection. The whole of the mill is lighted by 446 carbon filament lamps, the wiring being run in heavy gauge steel tubing.

It is pleasant to record that the introduction of electric drive with individual motors has effected considerable economy in the power requirements of the mill as compared with what would have been the case with the system of steam driving by means of open and cross belts, together with the shafting, and it would appear that this mill should prove a valuable object lesson to those interested in textile manufactures in Manchester district who are contemplating the pros and cons of a power supply in bulk by means of electricity.



A CASE OF LIGHTNING FLASH

By C. C. F. Monckton

An interesting case of lightning discharge came under the observation of the writer a short time back. A lighthouse standing on a rocky island rather more than 800 ft. in height was struck whilst nobody was inside. The lighthouse-keeper rushed in, to find the air in the lower story full of dust.

The writer examined the site about a week afterwards. The main lightning-conductor consisted of semi-circular copper three-quarters of a square inch in section, and this was connected to almost every independent piece of metal, including the oil-tank shown in the illustration. This lightning-conductor, however, was not connected to the oil-pipe at the side of the tank, and this pipe reached to the top of the tank and was bent over it.

The discharge evidently took place from this pipe

View Showing Path Taken by Discharge.

at *A*, where there were signs of burning, to the concrete floor at *B*.

The engineer who was responsible for the fixing of the conductor naturally thought the oil-pipe would be almost as good an earth as the main lightning-conductor, and the writer measured the resistances to direct current as 10·5 and 14·5 ohms respectively. The bend of the iron pipe was not so sharp as that of the copper conductor, so that, in the writer's opinion, it would appear to show that iron does not make as good a lightning-conductor as is thought by some experts. There was no evidence of side flash to the oil-pipe; it would appear that the current in it was due to inductive action, and that the impedance of the iron prevented the current flowing to earth through the pipe.

It will be noticed that the ohmic resistances were both high; but it would be extremely difficult always to keep the resistance low without an extra system of water tanks. When the main earth was well saturated with water the resistance dropped to about 2 ohms.

CATALOGUES AND PAMPHLETS RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

ELECTRIC LIGHT FITTINGS.—A handsomely printed new catalogue of standard lamps, with about sixty illustrations, is being issued by Messrs. W. A. S. Benson & Co., of 82 and 83 New Bond Street. The designs are all very artistic, and special features of the list are the fittings, which can be used either as table-lamps or wall-brackets, and the dinner-table standards.

TANTALUM LAMPS FOR SHIP LIGHTING.—A list from Messrs. Siemens Brothers Dynamo Works, Ltd. (incandescent lamp department), Tyssen Street, Dalston, gives particulars of those sizes of tantalum lamps which are specially suited for ship lighting, and also contains illustrations of a number of protected, water-tight, and other fittings specially designed for these lamps, both for ship and harbour lighting. Particulars of Siemens' carbon filament lamps are also included.

OUTSIDE LANTERNS, &c.—The latest leaflet issued by the Sun Electrical Co., Ltd., of Charing Cross Road, gives particulars of a series of enamelled steel outside lanterns for groups of metal filament lamps suitable for shop lighting and similar purposes. The same leaflet also deals with a useful porcelain covered connector.

Water Power in Tyrol.—A large concern in Munich has obtained concessions for the erection of water-power stations in South Tyrol, with a total capacity of over 100,000 h.p. Agreements have been made with the Austrian State railway authorities with regard to the eventual supply of electric power for sections of the railways passing through the district in question. The capital involved in the scheme is estimated at over two million pounds sterling.

A New Tantalum Filament.—According to the *Electrical World* (New York), an American patent has been issued to Werner von Bolton, Charlottenburg, Germany, for a filament, consisting of a homogeneous mixture of metallic tantalum intimately commingled with a carbide of tantalum or of a metal of the vanadium group. The most advantageous form of the invention is stated to be a mixture of tantalum and tantalum carbide, and is secured by heating tantalum powder held in a plastic mass by a binder which is carbonised by heat, thus giving rise to the carbide of the metal.

Flame Arc Lamps on Low Frequency Circuits.—Some 10-ampere A.E.G. flame arc lamps have been in use since the middle of last year at Oranienburg, supplied with current by means of transformers from the 6,000-volt, 25-cycle mains of the Prussian experimental single-phase railway. It is stated that the flickering of the light due to the low frequency is only noticeable when one looks directly at the lamps. The lamps are working under exceptionally severe conditions, as the voltage fluctuations are very heavy.

Siemens' Stafford Works Foremen's Dinner.—The second annual dinner of the shop officials and foremen was held last week at the Siemens Institute. Mr. J. Eaton Shore, shop superintendent, was in the chair. About 100 were present, and the arrangements were admirably carried out by the committee, Messrs. Briggs, Rathbone, and Saunders, with Mr. F. E. Read as hon. secretary. The toast of "The Firm" was proposed by Mr. Kilpatrick, supported by Dr. Kloss, and Mr. Koettgen, managing director, of London, responded, and spoke very encouragingly of the future prospects of the Stafford works. Mr. Palairet proposed "The Guests," and Mr. Kieffer, the Stafford manager, had a very cordial reception in responding to the toast. "Siemens Institute" was proposed by Mr. C. M. Toplis, and Mr. Read replied.

The Electrical Installation of a Technical College.—The electrical equipment of the new building of the Merchant Venturers' Technical College at Bristol comprises some unusual features. The main lighting of the large lecture hall is controlled from three points, two on the platform and one by the lantern, by means of tumbler switches which operate a solenoid main switch on the supply side of the distribution board for the hall. Tungsten lamps are employed throughout the building. The power switchboard consists of a collection of iron-clad quick-break switch-fuses by various makers, in order that the students may become familiar with the different patterns. Three large fans are used for the general ventilation of the building, and the starting switches and resistances for these are placed in the electrical engineering laboratory, so that tests can be made on them from there. For experimental purposes there are two alternating-current circuits at 105 and 210 volts respectively, and also a six-wire D.C. system supplied from a storage battery. Fourteen different pressures from 4 to 120 volts are available from these mains.

REVIEWS OF BOOKS

Transformers for Single and Multiphase Currents. By Gisbert Kapp. 354 pp. 8¾ in. by 5¾ in. 219 illustrations. (London: Whittaker & Co.) 10s. 6d.

Although this book is a second edition, not only have many of the chapters been completely re-written, but a large amount of new and valuable material has been added. It is thus best dealt with as a new book. With the exception of Prof. Fleming's classical work on the "Alternating Current Transformer," which, unfortunately, has not recently been revised, there is, in the English language, no other treatise of any standing which deals exclusively with transformers, and it is thus all the more fortunate that the present work is in all respects excellent and well up to date.

With a few exceptions, mostly inadvertent, the metric system is employed throughout the book. Prof. Kapp has also introduced certain innovations in the writing of engineering English, among which is the omission of the final "s" in the plural of volt, microfarad, henry, watt, &c. An equally unnecessary departure from recognised practice in technical literature is the substitution of the Greek letter ν for the symbol ~ to indicate the frequency in complete cycles per second. Nor does there appear to be any advantage gained by substituting the new term "fill factor" for the now widely employed "space factor." On the other hand, the term "crest" value instead of maximum value of a periodic function will be very useful, and may well be adopted. In Figs. 68 and 69 we find J employed where I is employed in the text, a trifling slip doubtless due to the transfer of these two illustrations from the author's German edition of the book. Another slip in revising or re-writing is that some of the text at the beginning of Chapter IV. is practically identical with that in Chapter VIII. In the latter chapter the author again embarks on an explanation of vectors and vector diagrams without any intimation that he has already covered the ground in an earlier chapter. Since, however, the treatment after the first few paragraphs of Chapter VIII. is on considerably varied lines, it constitutes an interesting review of an important subject, and should serve to strengthen the reader's grasp of the difficult points involved.

The book is one that we must recommend so heartily to all our readers, that we deem it essential at the same time to point out certain minor errors and discrepancies of which the earnest student should take note. Thus we consider that in the practical sections of the book the author might have taken "alloyed" iron as the only material suitable for employment in the construction of modern transformers. Not only would this have been in accordance with his own conclusions, but it would have rendered superfluous the repeated incorporation of data relating to inferior grades of iron. On p. 119 the author gives the price of alloyed iron as £66 per ton. When it was first placed on the market such prices were obtained for it, but at present the best quality rarely commands much more than half this price.

On p. 8 we find the following paragraph: "We also assume that the primary current is obtained from an alternator the E.M.F. of which follows a true sine law. This is not always, and indeed very seldom, the case." But five pages later we read: "Modern alternators give E.M.F. curves which do not deviate greatly from a true sine curve." This latter statement represents the true state of affairs. It is almost invariably specified nowadays in important cases that an alternator's pressure curve shall conform exceedingly closely to a true sine curve.

On p. 24 we find the following statement: "The real cause of the 'ageing' has not yet been discovered; all that can be said is that some plates show scarcely any signs of ageing, while others degenerate to some extent in the course of time, the additional loss, however, rarely exceeding 15 per cent." We do not agree with this. Although the reason of the ageing may not be clearly understood, there is now ample data available of compositions of good quality steel which will not age. Mr. Hadfield has patented a number of such compositions. Slight deviations from these compositions, however, often entail ageing vastly exceeding the 15 per cent. assigned by the author as the customary maximum.

On p. 81 is an illustration in which voltmeters are diagrammatically represented by the old hot-wire Cardew type. Few students of the present day have ever seen a Cardew voltmeter, and the diagram would puzzle them. It would be well in a future edition to use some other symbol for the purpose.

On p. 104 are given characteristic curves of alloyed and of ordinary iron. These curves can hardly be said to apply to many excellent brands of alloyed iron, for this material usually shows for all densities a greater magnetic reluctance than the ordinary iron.

On p. 130 the author expresses a preference for insulating the sheets from one another by the use of thin paper, and states that varnish does not afford so reliable an insulation. We cannot believe that the present tendency to revert to paper for the purpose in question is more than a passing fad; on the contrary, varnish affords a much more suitable insulating means, and when properly applied is thoroughly adequate for the purpose.

Although, in a few cases, the author gives the total cost of certain transformers of which he has also estimated the cost of the active material, he does not give any general data which would assist in arriving at the total works cost of transformers. We believe that with the data at his disposal he could readily have arrived at some approximate rule for obtaining the total works cost for various types, and that the use of total works cost, instead of the cost of active material in many of his highly interesting comparisons, would have added greatly to their instructiveness.

The following quotation is taken from p. 271: "The ratio of the total maximum of power supply observed in a given district to the sum of the maxima observed at different times in each individual house is called the *diversity factor*, and it is due to the circumstance that this diversity factor is larger than unity." The term "diversity factor" is used in opposite senses by various engineers, but in this case the author uses it in these opposite senses in the course of this single sentence.

In the last chapter, which is devoted to examples of modern transformers, certain heating curves of actual transformers are given, showing an ultimate rise of temperature of some 60° above the surrounding air. In general we should be inclined to criticise the present tendency towards permitting high temperature rise in electrical apparatus generally. A temperature rise of 40°, or at the most 45°, is the highest which should be considered good practice.

In conclusion, it may be useful to the publishers and author to give the following brief list of minor errata which we have noticed in the course of our perusal of the book:—

On p. 8, 7th line from the bottom: $B = \phi$: A is incorrect. It should read $B = \phi \times A$.

On p. 10, 20th line from top: $I\frac{E}{R}$ should be $I = \frac{E}{R}$.

On p. 57, 2nd line from bottom: For 200 read 1,200.

On p. 146, 17th line from bottom: For "an" read "on."

The Practical Engineer: Electrical Pocket-Book and Diary for 1909. 512 pp. 3½ in. by 5¾ in. (Manchester: Technical Publishing Co., Ltd.)

If not quite as pretentious as some of the higher-priced and more expensively printed electrical pocket-books, there is still a great deal of useful information in the little volume before us. In the nature of its contents, as well as in its size, no attempt has been made to go beyond the true pocket-book. There is a high percentage of tabular matter, mostly well chosen, and the mistakes so common to publications of this nature of falling into the style of an educational work, on the one hand, or a trade catalogue on the other, are largely avoided. The two main features of the true pocket-book, of accessibility of the contents and up-to-dateness of the information, have been kept in view, for a lengthy and fairly complete index occupies a prominent position in front of the book, and there are evidences of a good deal of revision. Much of the newly written matter relating to dynamo design, &c., has been compiled with the co-operation of Mr. C. C. Hawkins, and recent advances have necessitated additions to the sections, amongst others on measuring instruments, prepayment meters, motor starters, switches, incandescent and arc lamps, and electric welding. The extent of the revision is, however, rather unequal; for example, the pages devoted to metal filament lamps are very incomplete. The efficiency of the Osram lamp is not even mentioned, and no indication of the present voltage limits of any of these lamps is given. The Osmium lamp is described as being in the experimental stage, and the enormous field opened up by the 25-volt metal filament lamp has apparently not been realised by the compiler.

Fowler's Mechanical Engineer's Pocket Book, 1909. Edited by W. H. Fowler. 11th edition. (Manchester: Scientific Publishing Co.) 1s. 6d.

In this, the latest edition of a well-known pocket-book, the contents have been carefully revised so as to bring the subject matter well up to date. The printing and the paper of this edition are a distinct improvement over those of the earlier editions, and the few blank pages inserted at the end of each section should be found useful for notes and formulæ. There appear to be no new sections in this edition, but it will be remembered that two sections dealing with steam turbines and pumps and pumping machinery respectively were added in the tenth edition. The section on gas engines and the composition and relative calorific values of different gases should be useful to engineers in charge of gas-power generating stations. It is unnecessary to give a complete list of the contents of this book; it includes useful information concerning practically every branch of general engineering.

Electric and Petrol-Electric Vehicles. By W. Poynter Adams. Being Part II. of "Motor-car Mechanism and Management." 197 pp. 7½ in. by 5 in. 50 illustrations. (London: Charles Griffin & Co.) 5s.

The object of this work is not so much to give a complete account of the progress that has been made in the applications of electricity to road traction as to put in an easily intelligible form such information as may assist owners and drivers of electric automobiles to obtain an intelligent understanding of their various parts. The author is not concerned with comparisons between the capabilities of electric vehicles and those propelled by other means, and his descriptive matter is intended to be typical rather than exhaustive. Like many writers, he attempts to teach the elementary principles of electricity and magnetism in a single chapter, and although he has been careful not to wander into matters unconnected with the applications which he is considering, his explanations are rather too condensed to be easily grasped by the non-technical reader who attacks the subject *de novo*, and too elementary to be of much use to one who has already a little electrical knowledge. There is, however, a good deal in the section on the management of the battery, which the driver of an electrical vehicle might read with profit, although the actual care of a battery of this kind should always be in the hands of thoroughly experienced men. Some understanding of the action of the motors and a complete grasp of the connections of the controller should, however, be possessed by the driver in view of possible broken or loose connections and controller troubles which have to be remedied on the road, and here some of the chapters may be helpful. Illustrated descriptions are given of a few makes of accumulator carriages which are well known in this country. A concluding chapter deals with the working of petrol-electric systems as exemplified in the omnibus chassis of the British Thomson-Houston Co. and the Hallford-Stevens omnibus now running in London, but the possibilities of some such system for private cars are not discussed, and there are several petrol-electric systems which are not mentioned. At the end of the book is a glossary of selected electrical and automobile terms.

CORRESPONDENCE

HIGH-VOLTAGE TANTALUM LAMPS.

To the Editor of Electrical Engineering.

Sir,—We beg to call your attention to a misleading statement made in this week's issue of your paper, viz., that Messrs. Drake & Gorham are the *chief selling agents* for the above lamp. This, as is well known to a large portion of the trade, is not correct, but such a statement is likely to influence some firms who are not so well informed, and we further beg to state that *we* were the *original agents* for the Tantalum Lamp.

It is generally known that Messrs. Siemens Bros. Dynamo Works hold the rights of this lamp, and as *we were the first to introduce the same into this country*, we rightly claim the title of chief selling agents ourselves, and consider that such a misleading statement as published in your columns should be corrected.

We therefore should be obliged by your making a suitable correction in your next issue, and are,

Yours faithfully,

Krupka & Jacoby.

11 Queen Victoria-street, London, E.C.,
April 8th, 1909.

WIRELESS TELEGRAPHY AT SEA.

To the Editor of Electrical Engineering.

Sir,—With reference to my letter in your issue of February 4th last, under the above title, I should like to call your attention to the following short paragraph taken from the *Scientific American* of March 20th, 1909:—

Another "C. Q. D." message has awakened the public to the importance of equipping all ocean-going vessels with wireless telegraph apparatus. In the case of the collision between the *Horatio Hall* and *H. F. Dimock*, this importance was more strikingly shown than in the previous collision between the *Florida* and the *Republic*. The passenger steamer was equipped with wireless telegraph apparatus, but the injury it received was so serious that the operator had no time to send out any detailed information about the accident or its whereabouts. Although the passengers were taken aboard the *Dimock*, considerable anxiety was felt for their safety, owing to the absence of further wireless messages. The freight boat with the passengers aboard was in a precarious condition, but could summon no assistance because it possessed no wireless outfit. Had the law been in force compelling all vessels to carry wireless telegraph apparatus, it would have been possible for the *Dimock* to communicate with the revenue cutter *Gresham*, which was searching for it in the fog.

This supports in a quite remarkable manner the contention previously put forward by me, namely, that it is not sufficient merely to have a wireless equipment on all ships, but that either these equipments should themselves be on the directive system, or else that coast stations fitted with means for locating the origin of the signals be provided at suitable points.

I am, sir, yours, &c.,

L. H. Walter.

Westminster, S.W., April 2nd, 1909.

Mr. Béla Gáti also writes us on the same subject, pointing out that the rescue of the *Republic* after collision with the *Florida* was due very largely to the presence of mind of the operator Binns, but that there is a danger in relying upon the power of the operator to signal for many hours on a sinking ship. He suggests, therefore, that some simple signal should be sent automatically at regular intervals, and proceeds to show how, even in the case of installations not provided with directive apparatus, the distance and direction of the imperilled ship may be determined. The method depends upon Duddell's rule that, for a particular pair of installations, the distance between the sender and the receiver, multiplied by the strength of the incoming current, is a constant. Thus, by repeated measurements of the microamperes received by means of some such apparatus as Mr. Gáti's barreter measuring-set, a ship can ascertain whether she is moving towards the source of the signals by comparing the distance she has travelled herself with the difference in the distances observed in this way.

MANCHESTER SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

Short Papers on Gas Engines, Atmospheric Electricity, and Light Standard

At the annual general meeting of the Manchester Section of the Institution of Electrical Engineers, on March 23rd, in addition to the ordinary business, including the adoption of the report and the election of the officers and committee for the coming session, whose names were given in Electrical Engineering, April 1st, p. 307, three short communications from the Engineering and Physical Departments of the Manchester University were read.

The first of these, by Mr. A. H. Gibson, dealt with

The Combined Efficiency of Small Gas Engine and Producer Plants.

This Paper recorded a series of experiments recently carried out on a suction gas producer, coupled to a 24-b.h.p. "National" gas engine in the engineering laboratories of the Manchester University. The object of the tests was to determine the efficiency of producer and engine under different conditions of working. The fuel used throughout was gas-coke, containing 81·75 per cent. of carbon and 1·19 per cent. of hydrogen, and had a nett calorific value of 12,635 B.T.U. per lb. dry. The general conclusions to which the experiments led are as follows:—The composition and calorific value of the gas varies greatly with the quantity of water-vapour supplied to the vaporiser, as does the thermal efficiency of the producer, the latter attaining its maximum value, viz., 78·6 per cent., when the gas produced has its highest calorific value, viz., 127·1 B.T.U. per cub. ft. at 32° F. under a pressure of 29·921 inches of mercury. The efficiency of the engine, however, falls off as the supply gas becomes richer, the reduction of thermal efficiency being accompanied by a reduction in the percentage of heat rejected to the jackets, and in an increase in the percentage rejected in the exhaust gases. The engine has a maximum thermal efficiency on the b.h.p. of 26·9 per cent. and a minimum efficiency of 22·8 per cent. The overall thermal efficiency of the plant has a maximum value of 18·16 per cent., measured on the B.H.P., this occurring with a slightly greater vapour supply than that (0·4 lbs. per lb. of dry fuel), giving the maximum producer efficiency. This value coincides very fairly with that obtained by Drs. Bone and Wheeler in a series of trials on a large pressure producer developing approximately 3,000 h.p., and burning bituminous coal as fuel. Under conditions of maximum efficiency in the small producer, the consumption of dry fuel amounted to 1·11 lbs. per b.h.p. per hour.

The next Paper, read by Mr. W. Makower, described some investigations conducted by him, in conjunction with Margaret White and E. Marsden, on

The Electrical State of the Upper Atmosphere.

These investigations were made during July and August, 1908, and were chiefly concerned with the measurement of the electric currents flowing from a kite down the wire, by which it is attached to the winding machine. In the first experiments different lengths of wire were let out with the kite, detached from the winding machine, and the free end of the wire attached to an ebonite insulator fixed to the ground. The kite was then connected to earth through a sensitive dead-beat galvanometer, and the current measured. In these experiments the currents at considerable heights were so large that it was found necessary to reduce the sensitiveness of the galvanometer by shunting. The plan was therefore adopted in later experiments of using a portion of the kite wire when attached to the drum of the winding machine, which was earthed, as a shunt, and thus making use of the usual daily flights taking place at the Glossop Observatory. The mean currents obtained varied from 5×10^{-5} amperes at 2,000 ft. to 23×10^{-5} amperes at a height of 6,000 ft. The current at any fixed height varied considerably from day to day. There seemed, however, to be a fairly close connection between the current and wind velocity, the currents being great when the wind was high. A few experiments have been made on the potential of the air at different heights, but no very reliable results have yet been obtained on account of the difficulty of satisfactorily insulating for the high potentials to be measured.

In the last communication Mr. W. A. Harwood described

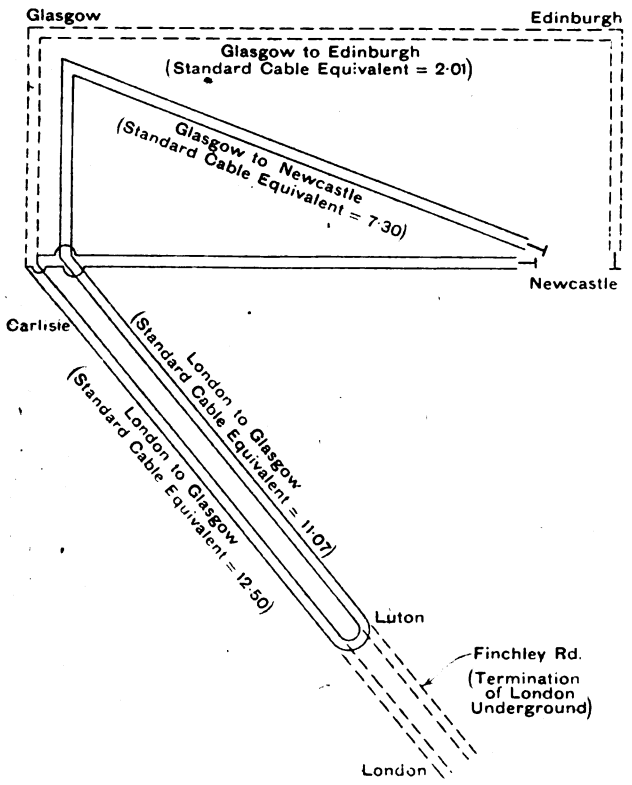
A New Standard of Light.

The proposed new standard is intended as a secondary standard, which may be stamped once and for all with a given candle-power, and will retain its value exactly for an indefinite period, thus obviating the necessity of more than two sets of photometer readings.

The new standard consists of the light emitted by a fixed area of an incandescent metal strip heated electrically. Of various metals tried, pure platinum has proved most suitable for the purpose. The method of adjustment depends on the different absorbing qualities of black fluorspar and water for waves of heat and light. The percentage of total radiation emitted by a heated platinum strip, which is absorbed by black fluorspar, is found to increase as the temperature of the strip is raised, while the percentage absorbed by water diminishes. At one particular temperature of the strip these two percentages are equal, and their equality fixes the conditions of the strip uniquely. In the actual apparatus two parts of the radiation from the strip pass through a plate of black fluorspar and a layer of water respectively, and fall on two sensitive thermopiles, which are connected in opposition through a galvanometer. The adjustment consists in regulating the current so that the galvanometer deflection is zero.

So far the strip has been photometered against an incandescent lamp run at constant voltage with very satisfactory results.

The "Electrobus" and the New Police Regulations.—According to the new Police Regulations with regard to motor omnibuses in London, no vehicle will be licensed unless it runs without undue noise, and has a registered weight of less than three and a half tons. This weight is the combined weight of chassis and body, and does not include fuel, water, or accumulators. Although the total weight of an "Electrobus," including the battery of accumulators, is nearly five tons, the weight without the battery is less than three and a half tons, and so no alterations will be required in the case of these vehicles. The petrol motor-omnibuses, on the contrary, will have to be considerably modified in construction, as most of them weigh over four tons. The London Electrobus Co. inform us that they have now twenty 'buses on service in London; there will be no difficulty in obtaining new licenses, as not only is the registered weight below the limit, but also there can be no question as to the freedom from noise. A complete description of the electrical equipment of the "Electrobus," and of the arrangements for charging the accumulators at the garage in Westminster, was given in Electrical Engineering for December 5th, 1907, Vol. II., page 903. In addition to the figures given in there, it may be mentioned that the consumption of a fully-laden 'bus on the level is 8 ampere-hours per mile, and that each 'bus averages some 45 miles on one charge. On some of the steeper hills, as much as 300 amperes is taken from the battery for short periods. Each 'bus has 47 cells permanently in series.



The Victoria Falls Power Scheme.—With regard to the reference in our last issue to the fact that the electrical machinery required for the Victoria Falls power scheme is being ordered in Germany, Mr. George Verity, of Messrs. Veritys, Ltd., writes to *The Times* as follows:—Your issue of Monday last contained a letter from Mr. Theodore Rich commenting on the fact that a company which is presumably an English one, and at any rate is appealing to the British public for capital—viz., the Victoria Falls and Transvaal Power Company—has placed the order for the whole of the electrical machinery required for its station in Germany, and, further, asking the reasons for this. This letter so far has not been answered. I wish to point out another side of the matter which is equally serious. This company mentions in its prospectus the expectation of supplying some millions of units of current to the different mines and stations in South Africa. This means that thousands of pounds will have to be spent by the users of the current in motors, arc lamps, and switchgear, and it is a known fact that in cases where central stations have been put down by German and American manufacturers the difficulty of English manufacturers securing orders for the above is immeasurably increased. Any manufacturing engineer in the electrical industry can tell you of this difficulty which exists, and which almost amounts to a boycott, in South America, where the central stations are in the hands of German and American companies, and if the same thing is to be extended to South Africa the outlook is indeed a poor one for the thousands of operatives in the Midlands and the North who are engaged in the manufacture of electrical supplies. If the company owning the station is a German one we cannot grumble, but can only regret that our English financiers did not seize the opportunity of developing this valuable field; but if the company be an English one such as the one in question, it is, as Mr. Rich points out, a very serious matter, as, as he remarks, "given financial support, open contracts, and fair play, we British manufacturers have nothing to fear with reference to price or quality from any foreign country."

DEMONSTRATION OF LONG-DISTANCE TELEPHONY

In place of the usual meeting of the Newcastle local section of the Institution of Electrical Engineers, Newcastle, in the Armstrong College, the members, to the number of about eighty, were on Monday, March 22nd, given an opportunity of witnessing a very interesting demonstration of long-distance telephony, which was organised by Mr. F. Tremain, Superintending Engineer of the Northern District of the Post Office Telegraphs. This took place at the Newcastle Post Office, special arrangements being made whereby the long-distance aerial circuits, which now extend from London to Glasgow, were put into operation. A circuit was made as indicated in our figure, so that both ends of the transmission system were brought to adjacent rooms at the Newcastle Post Office. The two trunk circuits from London to Glasgow were joined across at Luton, some 35 miles out of London, in order to avoid the effect of the underground cables in London. The connection between the aerial and underground circuits is made in the neighbourhood of Finchley Road.

The circuit as originally arranged was from Newcastle to Edinburgh, then across to Glasgow, and by one of the Glasgow-London trunk circuits to Luton, back again to Glasgow along the second trunk line, and then direct from Glasgow to Newcastle. This corresponded to a distance of 1,085 miles. Owing, however, to a temporary interruption on the section between Carlisle and

(Standard Cable Equivalent=39·17.)

Glasgow, the members of the Institution were only able to test a circuit of 875 miles, Carlisle being connected directly up to Newcastle, the Glasgow-Edinburgh and the Edinburgh-Newcastle section being cut out.

The eighty members were divided into two groups of forty each, each group taking one end of the transmission, the demonstrator for one group being Mr. Tremain, and for the other Mr. T. B. Johnson, the Assistant Superintending Engineer. The actual speaking tests were conducted by Mr. Drummond, Mr. Cox Walker, of Darlington, Mr. Kirkpatrick, City Engineer of Newcastle, Professor Stroud, of Armstrong College, Mr. Holmes, of Messrs. J. H. Holmes & Co., Mr. Sorensen, of the Radio-Telegraph Co., Mr. Slea, and Mr. J. R. Andrews.

Mr. Tremain stated that the practical limits of telephony by means of trunk cables is represented at present by the service between Manchester and Liverpool, and the provision which is now being made for service from Newcastle to Stockton and Middlesbrough, which is equivalent to about forty miles. The standard cable used in the course of the experiments was made up of actual spare conductors available in the pipes in Newcastle. This cable was equivalent to 48 miles of the standard cable agreed upon between the Post Office and the National Telephone Co. as regards electrical constants, as the standard of reference in determining the efficiency of telephone lines for subscribers' purposes and for wires between exchanges. It had points of access at six mile intervals. Mr. Tremain explained that the aerial line between Glasgow and London was constructed of 800 lb. conductors, so that in this section of the circuit the copper of each pair of wires weighed 300 tons. Taking the whole route in this item of the demonstration, copper wires weighing nearly 750 tons were utilised. An interesting point which was mentioned was that, owing to the degradation of telephonic speech, owing to small wires used in towns, and the underground circuits used in London and Glasgow, and one or two other places, a considerably larger amount of copper was required in the aerials than would otherwise have been necessary. Had the circuits been aerial throughout, without the interpolation of cables at any point, 600 lb. wires would have been sufficient for the purpose of trunk transmission.

In addition to the tests on the long-distance circuits, Mr. Tremain placed at the disposal of the members of the Institution the new cable between Newcastle and North Shields, for the purpose of experimentally trying the effect of telephonic communication on superimposed and super-superimposed circuits. These devices were referred to in Mr. Tremain's Paper before the Institution, printed in our issue of April 2nd, 1908. The operation of the "phantom" circuits was a very interesting part of the evening. The particular cable under test consists of a number of four-pair cores, two of which were used, thus providing circuits of 16 miles in length. It was possible by superimposing "phantom" circuits on four pairs of wires to allow 14 persons, seven at each end, to maintain independent conversation without cross talk. It was noticed that whilst good communication was obtained on all the telephones, the super-superimposed circuit, although made up of 400 lb. conductors, without the transformer losses peculiar to the other six circuits, was not so efficient as might have been expected when compared with those circuits for which 100 and 200 lb. wires were used through transformers. This was explained by the fact that the increased conductivity was balanced by the increase in mutual capacity of the two diagonal pairs of wires used as the "A" line, relatively to the similar two pairs of wires used as the "B" line for the super-superimposing.

In the long-distance conversations the members of the Institution conducted very interesting tests relating to the actual value of the standard cable equivalent determined by the Post Office and National Telephone Company. They were asked to compare the clearness of speech obtained through the long-distance aerial circuit and the standard cable respectively, and the consensus of opinion was that the speaking efficiency of the aerial circuit corresponded to between 30 and 36 miles of the standard cable. On calculating this out it was found that the actual figure according to the Convention was 31 56 miles.

The members were given an opportunity of getting into communication with Belfast by means of the Newcastle to Leeds and the Leeds to Belfast lines, this being a distance of 345 miles, including about 20 miles of submarine cable. The line was further extended from Belfast to Dublin, thus making a distance of 445 miles. Owing to the Irish submarine cable being almost identical with that crossing the Straits of Dover in the Anglo-French telephone service, the experiment represented the approximate conditions obtaining between Hull and Leeds (which are the most northern towns on the east coast enjoying Continental service) and the French end of the Franco cable. Although communication was practicable, it was evident that there was no room for an extension on the line by a distance representing that necessary to put Newcastle into communication with the Continental service, and it was stated that the extension of the Continental service in England is not possible until the municipal bodies in intervening towns waive their objection to having heavy aerial trunk circuits passing through their towns. The sphere of underground lines, it was said, may therefore be limited to local services and short trunks, and they must not be considered suitable for extended trunk main communication with the Continent.

At the conclusion of the demonstration, which was much much appreciated by all the members present, a hearty vote of thanks, moved by Mr. J. H. Holmes and seconded by Dr. Thornton, was given to Mr. Tremain and his staff for the immense amount of arrangement which must have been necessary to enable eighty persons to participate in the demonstrations.

LOCAL NOTES

ACTON: *Proposed Lease of Electricity Works.*—The Council held a further sitting last week to consider the offer of the Metropolitan Electric Supply Co., Ltd., to lease the local electricity undertaking. Particulars of the proposal have been given in previous issues, and a resolution to enter into a lease was rejected by seven votes to six. A committee, however, has been formed to negotiate further with the company.

ARGENTINE: *Buenos Aires Exhibition.*—It is anticipated that a large number of English manufacturers and engineering firms will take part in the Exhibition of Railways and Land Transport which will be held in Buenos Aires in 1910, in connection with the first centenary of the Argentine independence. The Exhibition will open on May 25th and close on November 25th.

BELFAST: *Tramway Accounts.*—The financial statement for the year ended March 31st shows gross receipts amounting to £195,155 and gross working expenses to £108,881, the former being an increase of £1,522 over the previous year and the latter a decrease of £10,942. After meeting capital charges, &c., there is a net profit of £14,600, from which is deducted the annual depreciation allowance fixed by the Council of £13,000. The balance of £1,600 has been applied to the reduction of the debit balance, which at the commencement of the year stood at £2,874, thus reducing it to £1,264. The estimates by Mr. Andrew Nance, the manager, for 1909-10, show total receipts amounting to £202,500 and working expenses £105,000. Fixed charges will absorb £48,500, and the estimated balance will be disposed of as follows: Depreciation, £15,000; cost of Act, £5,000; Statutory Reserve Fund, £7,200; Sinking Fund, £23,800.

CHICHESTER: *Electric Supply.*—The works of the Chichester Electric Light and Power Co., which have been designed by Mr. Horace Boot, consulting engineer of Westminster, are nearing completion, and it is hoped that a supply will be given in a few weeks' time. This is one of the first electricity works relying entirely on Diesel oil engines for its prime movers, and these have been supplied by Messrs. Mirrlees, Bickerton, & Day, Ltd. The contractors for the whole of the works are Messrs. Johnson & Phillips, Ltd., and Mr. Boot has had as his clerk of the works Mr. R. V. Weare.

COLCHESTER: *Electricity Works Vibration.*—The action by Messrs. Hollington Bros. against the Corporation in respect of alleged vibration at the electricity works has been settled by the payment of £300 to this firm, in full discharge of costs and damages, and in final settlement of all claims.

DERBY: *Overhead Wires.*—A direct-current supply is being given to the Parker Foundry Co. by means of overhead wires.

EALING: *Hire-Purchase Wiring.*—The Council, through contractors, are to undertake the wiring, &c., of St. John's Church. The estimated cost is £200, and the Council are to be repaid this sum by twenty-eight quarterly instalments of principal with interest.

ECCLES: *Tramway Inter-communication.*—The proposal of the Salford Tramways Committee that their Eccles cars should travel to Worsley partly over the Eccles Corporation lines and partly over the track of the South Lancashire Tramways Co. has been approved.

INDIA: *Electric Lighting.*—We read in the *Indian and Eastern Engineer* that the machinery for the electric lighting of Pondicherry is nearly ready for use. It consists of two Campbell's 30-B.H.P. gas-engines, with gas-manufacturing apparatus, two 50-ampere dynamos capable of being worked up to 500 volts, with balancers, switchboards, &c. The installation is being carried out by Messrs. Siemens Brothers' Dynamo Works, Ltd., their engineer, Mr. Klug, having charge of the erection. The street lighting will be by means of 524 25-c.p. tantalum lamps.

Water Power Electric Scheme.—It is stated in *Commercial Intelligence* that a big scheme contemplating the supply of electric power to all the local mills and other users of power is being promoted in Bombay. The scheme involves the impounding and storing, in three large reservoirs, of water collected from the Ghat Mountains. These reservoirs would be formed by constructing masonry dams across the Shirawta, Walwhan, and Lanoula valleys. From thence the water would be allowed to flow in an open duct to a forebay, and from thence be conveyed through a penstock to the power station near Khopoli. The difference in levels between the forebay and the site of the power station is some 1,734 feet. Overhead transmission at 45,000 volts will be employed over a distance of 43 miles, to a sub-station in Bombay, where it would be reduced to varying pressures, and then distributed to suit the requirements of individual consumers. It is intended to provide consumers of power in the cotton mills with the necessary electrical machinery. The proposal is, in the first instance, to sell 40,000 b.h.p. to the cotton mills, and other consumers in Bombay. By an agreement three strong financiers guarantee for ten years the sale of a minimum of 17,500 i.h.p. to cotton mills. His Highness the Maharaja of Bhavnagar has authorised the publication of his intention to subscribe Rs. 20 lakhs, and H.H. the Gaekwar Rs. 10 lakhs, of which half will be ordinary and half preference shares. Part of the capital is expected from London.

LIVERPOOL: *Lighting of Public Buildings.*—A proposal was put before the City Council last week for the appointment of an electrician to supervise the electric lighting arrangements in the buildings under the control of the various Corporation Committees; but the Finance Committee have reported that they do not think it would be desirable to take this course of action at present.

LONDON: *London County Council: Tramwaymen's Grievances.*—A mass meeting of the London County Council tramwaymen was held on Saturday night, at the instance of the Highgate and District branch of the Amalgamated Association of Tramway and Vehicle Workers. An agitation has been going on for some time in regard to extra pay for Sunday and holiday times, the reduction of spread overtime, &c., and the Highways Committee of the Council in October last promised to do all that they could in the matter. Since then, it is stated, the men have received no communication from the Council, and a resolution was passed at the meeting on Saturday, resolving to put the men's case before the public, and afterwards to take a ballot as to presenting an ultimatum to the London County Council of the intention of the men to refuse to take out the cars.

Tramways.—A further section of the Council's electric tramway system between Finsbury Park and Clerkenwell was opened on Sunday.

Marylebone: Street Lighting.—In connection with the recent decision of the Council to spend £8,000 upon street electric lighting, and the refusal of the London County Council to sanction the loan, it has been decided to put the scheme in hand pending the decision of the Local Government Board, upon the Borough Council's appeal to that body. As a commencement of the work, metal filament lamps will be erected in Harley Street.

Southwark: Bridge Widening.—A scheme is being put forward by the Bridge House Estates Committee of the City of London Corporation for the rebuilding and widening of Southwark Bridge at a cost of about £1,000,000. The plans for this work take into account the possibility of running tramways over the bridge in the future.

Stepney Tramways.—As pointed out in our last issue, the London County Council have asked for the Borough Council's consent to the use of the overhead trolley system in a portion of the Mile End Road. At its meeting last week, the Stepney Council declined to come to a conclusion hurriedly, and have referred the letter of the London County Council to their Works Committee for consideration and report.

LOUGHBOROUGH: *Electricity Charges.*—The Town Council have decided to reduce the price of current for combined lighting and power purposes for workshops and factories, for night shifts between the hours of 9 p.m. and 8 a.m., to ¾d. per unit.

MIDDLESBROUGH: *Supply to Docks.*—The North Eastern Railway Co. have inquired from the Corporation what terms they would charge for a supply of electrical energy to their docks in the event of the present generating plant being removed. The negotiations are being carried on by the Electrical Engineer and the chairman of the Electric Lighting Committee.

Electric Lighting Profits.—Mr. H. M. Taylor, the Borough Electrical Engineer, recommends that as a substantial profit will be shown on the working of the electricity undertaking for 1908-9, the sum of £1,482 should be contributed towards the rates, for the reason that during the first two years of the undertaking money was drawn from the rates in order to make up deficiencies.

MIDDLESEX: *New Tramways.*—Major Pringle last week inspected the new tramway from Southgate *viâ* Friern Barnet and Woodhouse Lane to the Great North Road.

MONTE VIDEO: *Electric Lighting.*—The profits of the Government Electric Light Station for 1907-1908 amount to $142,556·47 gold, or 17·80 per cent. on the capital. The profits are $250·33 less than for the previous year. The reason for the decrease, says the *Review of the River Plate*, is that the price for current consumed by the Government has been reduced from 15 cents per kw. to 10 cents. The increased demand for current has not been met, as the mains would not allow of same.

PEMBROKE: *Tram Track Levels.*—In the Vice-Chancellor's Court in Dublin last week the Pembroke Urban District Council applied for an injunction against the Dublin United Tramways Co. restraining them from continuing to reconstruct the Sandymount tramline upon levels differing from those that had met with the approval of the Council's engineer. After a lengthy discussion, it was agreed that the Company should continue to work upon the levels originally started, and that the Council should make up the road to the necessary height, leaving it open for future action to determine whether the Company is in the right. Should the result of these arbitration proceedings be unfavourable to the Company, they will repay the Council the cost of levelling the roadway to meet the track.

SOUTH AFRICA: *East London Harbour Power Station.*—A deputation from the East London Town Council, says *South Africa*, recently waited upon Mr. Sauer, Commissioner of Public

Digitized by Google

Works at the Cape, with reference to leasing from the Government the Harbour Electric Power Station. Afterwards a special meeting of the Council was held to consider a proposed offer, and stress was laid upon the importance of the Council having the exclusive right to supply current at the harbour. It was decided to make an offer to the Government, the principal provisions being as follows :—The Council to lease from the Government the power station buildings and site, together with the railway siding adjoining the power station. The lease to be for twenty years, plus three years' notice in the event of the Government desiring to terminate the lease at the end of the said twenty years by reason of their requiring the site for harbour purposes. In the event of the Government not wishing to terminate the lease at the expiration of the said period of twenty-three years for the reasons above stated, the Council shall have the option of renewing the lease for a further period of not less than ten years on the same terms and conditions as above set forth. The Council to pay £520 per annum, being interest at 4 per cent. on £13,000. The Council to purchase outright for £5,000 the plant, machinery, and fittings, together with the existing cables in the Buffalo River. The Government to land all coal required by the Council at net cost, not to exceed 1s. 6d. per ton, plus the tariff charge for the use of the Temperley transporter, the Council to have the option of co-operating with the Government in obtaining supplies of steam coal. Provided always that the Council be granted the exclusive right of supplying during the term of this lease all electric current required by the Government for railway and harbour purposes at 5d. per Board of Trade unit in bulk. The Council not to be liable to any penalty for any failure of supply. The Council not undertaking the upkeep and maintenance of any portion of the Government electrical installations and apparatus. The Government to agree to pay to the Council for a minimum guaranteed number of units per annum.

SOUTHGATE: *Electric Lighting.*—The local Ratepayers' Association has addressed a letter to the Board of Trade with reference to the proposed transfer of the Southgate Electric Lighting Order of 1904 to the North Metropolitan Electric Power Supply Co. The purport of the letter is that the Council, under the deed of transfer, has not sufficient control with regard to the laying of mains, in so far as this relates to the compulsory area, and it is further urged that the terms of re-purchase by the Council at the end of 14, 21, and 28 years, namely, the amount of capital expenditure with a bonus of 25 per cent., are unreasonable. The Association suggests that a deduction should be agreed upon in respect of depreciation, on the basis of a fixed annual percentage upon the capital expenditure, or that the bonus percentage should be considerably reduced, particularly in the event of the purchase being effected at the end of the 21 or 28 years. Difficulties are also foreseen in the wording of the agreement in the event of any of the mains or buildings being used by the company for purposes other than those of the Southgate undertaking. It is also asked that provision be made for the supply of electrical energy for public lighting at special rates, and finally the Board of Trade is asked not to proceed with the proposed transfer until they have considered the advisability of the Council working the undertaking, by taking a supply in bulk from the company.

TORQUAY: *Electric Supply Charges.*—The Electric Lighting Committee's recommendation that a flat rate of 4½d. per unit should be adopted instead of the present maximum demand system has been agreed to by the Corporation. It is estimated that this new tariff will result in a loss of £500 per annum, but at the present rate of connecting new consumers this is not regarded as a serious matter.

YORK: *The Tramway System.*—A special meeting of the City Council was held last week to consider the question of the tramways. It will be remembered that some 21 tenders have been received for running or leasing the tramway system recently acquired by the Corporation from the York Tramways Co., and for its conversion to electric traction. The special meeting referred to did not consider the tenders in detail, as they have not yet been fully considered by the Tramways Committee, but the object was to obtain a declaration of policy in regard to the matter generally. The Chairman of he Tramways Committee stated that tenders have been received for the overhead sysem, the G.B. Surface Contact system, the Lorain Surface Contact system, and also from the Railless Electric Traction Co. After the most careful consideration, however, the Tramway Committee decided to recommend the overhead system, solely on the score of expense. A recommendation to this effect resulted in 20 voting for it, and 20 voting against it, and, as the Mayor refused to give the casting vote, the motion fell through.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—The Board of Guardians have finally adopted the recommendation to use electricity at the Abbey Sanatorium. The estimated cost is £4,080, including mains from City boundary, switchboard, motor-generator, &c., and buildings.

BRADFORD.—The Corporation invite tenders by April 28th for the supply and erection of natural draught chimney type cooling towers. Particulars from the City Electrical Engineer, Mr. T. Roles. Fee, one guinea (returnable).

BRAY.—An application is to be made for a loan of £2,600 for extensions to the electricity undertaking.

HORNSEY.—The Borough Council have applied to the Local Government Board for sanction to borrow £6,000 for extensions of mains and house services.

KEIGHLEY.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £12,250 for the electricity works extensions.

LOUGHBOROUGH.—The Local Government Board has sanctioned a loan of £1,559 for prospective expenditure on mains. In giving sanction to this loan, the Board point out that the Loughborough electricity undertaking is not at present in a satisfactory position, and the loan is sanctioned on the understanding that the Council will at once take such steps as may be necessary to place the undertaking on a proper footing.

Miscellaneous

BACUP.—The Electricity Committee recommend the continuation of the tramways from Rochdale to the centre of Bacup. The sanction of the Local Government Board has been received to the borrowing of £25,770 for the reconstruction for electric traction of the tramways between Bacup and Rawtenstall.

DUBLIN.—Tenders are invited by the Commissioners of Public Works for electrical supplies. Particulars from the Clerk, Office of Public Works, Dublin, and tenders by April 30th.

LONDON: *London County Council.*—Tenders are invited by May 4th for the road-work and platelaying required for the authorised tramways in Cedars Road, Clapham Common (north side), and Long Road, and also in Malpas Road and Sherdeloes Road. The two routes being the equivalent of 2½ miles of single track. The Council will provide the track rails, slot rails, conductor rails, and special junctions, cross-overs, &c. Particulars from the Engineer to the Council. Fee £5 (returnable).

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON, E.C.—Alterations and equipment to Sir John Cass's Technical Institute, 31 Jewry Street, Aldgate, for the Governors.

S.E.—Housewifery centre at "Tooting Graveney" site. T. J. Bailey, architect, L.C.C. Education Committee, Victoria Embankment, E.C.

S.W.—Additions to Wimbledon Technical Institute, Gladstone Road, Wimbledon. Builders, Jarvis & Richards, 9 Queen Anne's Gate, S.W.

The Kensington Board of Guardians invite tenders by April 29th for electric wiring of the workhouse chapel and Guardians' offices at Marloes Road, Kensington. Particulars from the Clerk to the Guardians, Marloes Road, Kensington.

W.—Alterations to Wesleyan School, Ealing.

Ice-making works, Paddington (£10,952). Architect, H. Phelps, Drew, 33 King Street, Covent Garden, W.C.

PROVINCES.

BLACKBURN,—Police quarters, sessions house, &c. (£,000). W. Stubbs, engineer, Blackburn Town Council.

WALSALL.—Drill hall, Whittimere Street, for the 5th South Stafford Regiment, County Association of Staffordshire.

TENDERS RECEIVED AND ACCEPTED

ACCRINGTON.—The Council have accepted the tender of the British Electrical Engineering Co. for two new double-deck cars and also a single-deck car.

CROYDON.—The Council have accepted the tenders of J. H. Gilman & Co. for the annual supply of hard steam coal to the electricity undertaking, and of William Cory & Sons, Ltd., for small coal.

DERBY.—The tender of Messrs. Aiton & Co. for piping to the water-softener, and steel piping, has been accepted at £320.

GLOUCESTER.—The following tenders have been accepted for the supply of rough small steam coal during the period ending Sept. 30th, 1909 :—Messrs. Sully & Co., 7s. 7d. per ton; Mr. Alexander Crane, 8s. 2d. per ton; and Messrs. J. N. Baldwin & Co., 9s. 10d. per ton.

Digitized by Google

LONDON: *Stepney.*—The Council has accepted the tender of the City Glass Co. for the annual supply of arc lamp globes. The estimated amount of the goods required is £58. Conditional upon a trial being satisfactory, an order has been placed with H. Bennett at £120 for a "Fumicide" smoke-prevention apparatus. The Council is to have the option of ordering three additional apparatus at an inclusive sum for the four of £450, or in all, six apparatus for the sum of £600.

PORTSMOUTH.—The Board of Guardians have arranged with the Corporation Telephone Department to instal a telephone system in the Guardians' buildings at £41 5s.

WALSALL.—The Council have accepted the tender of Messrs. Youngs to supply 56 jacks for the tramways undertaking at £1 12s. 6d. each.

WATFORD.—The Council has placed an order with the Lea Recorder Co. for a meter at £80. The tender of Kaye, Son, & Co., Ltd., for the annual supply of coal to the electricity department, has been accepted.

WIMBLEDON.—The Council have recently accepted the following tenders for annual supplies for the electric lighting undertaking:—Cables and conduits, high and low tension cables, public lighting cables, house and lamp service cables, and pilot wires; Western Electric Co.: conduits; Albion Clay Co., Ltd., and Doulton & Co., Ltd.: joint boxes and jointing materials, compounds and tapes, and frames and covers; Callenders Cable & Construction Co., Ltd.: house cut-outs; British Insulated & Helsby Cables, Ltd.: transformers and meters; General Electric Co., Ltd.: carbons; W. Giepel & Co.: V.I.R. cables; Siemens Bros. Dynamo Works, Ltd.: accessories; General Electric Co., Ltd.: arc lamp globes; E. J. Shaw & Co.: flame arc lamp carbons; Union Electric Co.: castings; F. Bird & Co.: firebricks and fireclay; Hall & Co., Ltd., Croydon.

COMPANIES' MEETINGS AND REPORTS

BRITISH ALUMINIUM CO.—The meeting of the first mortgage debenture-holders, which was adjourned on March 29th, owing to the absence of a quorum, was held last week, when the necessary resolutions varying the terms of the trust deed, empowering the creation of £100,000 further debenture stock, and giving authority to the Loch Leven Water & Electric Power Co. to raise debentures amounting to £240,000, were passed. It was stated that the development of the Kinlochleven Works would eventually involve a sum of £1,000,000, and the greater portion of this expenditure must be made through the Loch Leven Co., which is the Parliamentary company holding the special Act of Parliament in respect of the water power there. Owing to the break-up of the "pool" of aluminium manufacturers, the company has been forced to push forward with this work in order to greatly increase its output, their prospects of profit now being a large output at low prices, instead of a limited output at comparatively high prices.

INDO-EUROPEAN TELEGRAPH CO.—The accounts for 1908 show a net profit of £57,105, to which has to be added the balance of £8,558 brought forward from the previous year. The sum of £5,000 has been set aside to meet line repair contingencies, and after deducting the amount absorbed by the interim dividends, the balance for distribution is £47,084. A dividend of 17s. 6d. per share, making 6 per cent. for the year, and a bonus of 20s. per share, is declared for the half-year to December last, and after handing over to the trustees of the Retirement Trust Fund a further sum of £5,000, the balance of £10,209 is carried forward.

ANGLO-ARGENTINE TRAMWAYS CO.—At the annual meeting last week, the report and accounts given in our last issue were adopted. The chairman, Mr. J. B. Concanon, supplemented the particulars given in the report with regard to the various companies which had been absorbed by mentioning that the Grand National and La Capital Traction and Electric Companies' systems had been worked by the Anglo Company as from April 1st. Since the last annual meeting the Board had submitted to experts the question of the figure which should be charged to revenue each year in respect of depreciation renewals fund, and had arrived at the conclusion that £48,000 was amply sufficient for this purpose for 1908. In addition £52,742 was spent upon renewals during the year, and no less than £136,744 upon ordinary maintenance. Both these items had been debited to revenue. With regard to the present year the directors anticipated that although this would still be a period of transition, the accounts would, after providing for all prior charges, leave a balance sufficient to pay a satisfactory dividend on the ordinary shares, whilst further substantial improvements were looked for in the net revenue for the year 1910 and subsequent years.

CALCUTTA TRAMWAYS CO.—The report for 1908 shows total receipts amounting to £165,547, and working expenses £105,800. The revenue, including interest and the amount brought forward is £60,592, and after deducting debenture interest and interim dividends on preference and ordinary shares, there is an available balance of £19,094. The directors propose a final dividend of 2s. per share upon the ordinary shares, making 4 per cent. for the year, and after adding £5,000 to depreciation fund, there is a balance of £333 to be carried forward. The depreciation fund now stands at £49,955. There has been a decrease in the traffic receipts from the Calcutta section amounting to 3 per cent. compared with the previous year, which is mainly due to the general depression of trade, and the fact that large numbers of people have refrained from visiting Calcutta owing to the political unrest, and the abnormal rainfall.

ROTHESAY TRAMWAYS CO.—At the annual general meeting last week, the report and accounts given in our last issue were adopted. Mr. A. C. Miles, the chairman, pointed out that the result of the year's working was a decrease in the traffic receipts amounting to £620, and a decrease in the working expenses, excluding depreciation, &c., of £340, so that, on the net working for the year, they were £280 worse off than in 1907, which accounted for the ½ per cent. reduction in the ordinary dividend. It was very satisfactory to know that there were signs of a revival of trade on the Clyde, from which the company drew the greater proportion of its traffic, and with the return to the former prosperity, the company might confidently look forward to a share in the revival of business.

SOUTH WALES ELECTRICAL POWER DISTRIBUTION CO.—At the annual meeting last week the report and accounts given in our issue for April 1st were adopted. The chairman, Mr. W. Gascoyne Dalziel, who presided, said that virtually the whole concern was in the hands of the debenture holders, who had voluntarily entered into an agreement with the Treforest Electrical Consumers Co., Ltd., the object of which was to secure the continuity of the supply to the respective collieries and works, of those who had formed this subsidiary company. The sum of £3,000 had been spent in bringing the Treforest generating station up-to-date, and this capital expenditure had already resulted in very satisfactory economies in working, although the full benefit had not yet been realised. The number of connections to the mains of this company amounted to about 6,700 h.p., and when the additional connections promised by the existing consumers had been completed, this would at least amount to 9,000 h.p. It had originally been intended to form a similar consumers' company for the Cwmbran area, but this scheme fell through, and the Treforest undertaking undertook the working of this power station, and were now linking up the two areas with the object of dealing with both from the Cwmbran power station. Whilst it was quite impossible to put forward anything at all hopeful in the way of a promise of a dividend, it was a fact that, in addition to saving the undertaking from destruction, a good deal had been accomplished in clearing away obstacles, and when the Treforest Company found themselves in the position of paying the debenture interest out of their revenue, it might be possible for the South Wales Company to purchase the prior lien debenture bonds held by the Treforest Company, and to resume control of the undertaking. When that time arrived probably a scheme of reconstruction might be involved, and placed before Parliament for sanction.

WILLANS & ROBINSON.—At the annual general meeting last week the report and accounts given in our issue for April 1st were adopted. Mr. J. C. Peache, the managing director, who presided, stated that the depression in trade had been severely felt in the steam turbine business, and the company, in addition, had had recently to meet a very strenuous competition from rivals who were exploiting new types of turbines. He regretted that the Board were not yet in a position to put the works on full time. The results at Rugby, however, had been very good, as the total quantity of work turned out during the second half of 1908 had exceeded anything ever achieved before. The recommendation with regard to Mr. Mark Robinson was carried.

METROPOLITAN ELECTRIC TRAMWAYS.—At the annual meeting last week the report and accounts given in our issue for April 8th were adopted. Sir Ernest Spencer, the deputy-chairman, who presided, stated that the company had now 42 miles of line in operation, 31 miles of which were leased from various local authorities, and 11 miles were owned by the company. The full number of miles authorised was 64, but it seemed extremely likely that for some years they would not attempt to develop more than 54. An unpleasant feature, which would, however, shortly be removed, was that some sections of their lines were detached. For instance, Wood Green and the Great North Road were not physically connected, and similarly there was a gap between the Great North Road lines and those in the Edgware Road. These gaps, however, would very shortly be filled up, and they would then be able to run continuously some 22½ miles, from the north-eastern corner of their system at Waltham Cross to the west in Wembley.

GANZSCHE ELEKTRICITATS GES., BUDAPEST.—The report for the past year shows a net profit of 522,000 kronen (approximately £22,000), enabling a dividend of 5 per cent. to be paid. A sum of approximately £3,000 is carried forward.

BERGMANN-ELEKTRICITATSWERKE, BERLIN.—The report for the past year, which will be put before the general meeting on May 1st, proposes a dividend of 18 per cent., as in the previous year. The net profit amounts to £224,200. It is stated in the report that business in all the various departments is normal, with the exception of the metal filament lamp department, which is doing much better than last year. The meeting will be asked to empower the directors to raise further

Digitized by Google

capital to the value of £500,000, for the purpose of financing new electrical undertakings if the opportunity arises.

BATH ELECTRIC TRAMWAYS CO.—At the ordinary general meeting last week the report and accounts given in our last issue were adopted. Sir James Sivewright, chairman of the company, who presided, regretted the nature of the report, which he said was due to circumstances beyond the directors' control. All the tramway undertakings throughout the kingdom had been affected by decreased receipts during the year in the same way that they had, and, in addition, there were special circumstances in Bath which rendered their revenue liable to fluctuations. On the other hand, working expenses, once they got to a certain stage, were very difficult to reduce. As far as the future was concerned, the receipts were at present showing a tendency to increase over those of the corresponding period of last year, and, granted anything like decent weather, there was every reason to hope that their receipts for the whole year would be materially greater than those of 1908.

EDWARDS AIR PUMP SYNDICATE.—At the annual meeting held last week, Mr. C. Williamson Milne, the chairman, presided. With regard to the results for the past year, he pointed out that coincidentally with the depreciation in shipbuilding, there had been no great activity in municipal electric lighting and traction undertakings. So many municipal corporations throughout the country had in the past installed machinery in advance of their needs, that economy being the order of the day now, they found their existing plant gave them an ample margin for the reduced loads of their power stations, due to the introduction of the metal filament lamp. In these circumstances it was not surprising that the number of pumps booked last year had been less than in previous years, the number for 1908 being 800, and the average for the few previous years being 1,200 per annum.

CUBA SUBMARINE TELEGRAPH CO.—The report for the December half-year shows total receipts amounting to £14,858, and expenses to £6,025. Adding the balance brought forward from last year there is a total sum available of £15,588. After adding £1,000 to reserve fund (making this £111,000), a dividend of 6 per cent. is recommended on the ordinary shares, carrying forward £6,788.

SOUTHPORT TRAMWAYS CO.—The report for 1908 shows a net balance of £376. A payment of £1,053 has been made to the Southport Corporation towards maintenance and renewal of permanent way, and £5,573 to local authorities under various agreements. The directors propose to apply the sum of £250 to depreciation and reserve account, and to carry forward the balance of £126.

RIVER PLATE ELECTRICITY CO.—At the annual meeting last week the report and accounts given in our issue for April 1st were adopted. A dividend of 8 per cent. per annum was declared upon the ordinary shares, and in order to meet the expansion of the company's business, it was resolved to issue new preference shares to the value of £50,000.

ARBROATH ELECTRIC LIGHT & POWER CO.—At the annual meeting last week Mr. George Balfour, the chairman, stated that the accounts for the period from August 19th, 1908, when the works were opened, up to December 31st, showed a profit of £127. It was resolved to carry this sum forward.

BRISBANE ELECTRIC TRAMWAYS INVESTMENT CO.—The accounts for 1908 show a balance of £61,220, and after meeting debenture interest and preference dividends, the directors recommend a dividend of 6 per cent. on the ordinary shares, carrying forward £1,670.

CANADIAN GENERAL ELECTRIC CO.—The profits for the year 1908, before providing for depreciation and interest on borrowed capital, amount to $753,088. Depreciation of buildings, machinery, patents, &c., and interest, account for $242,720, and dividends paid absorb $459,042. There was a balance of $145,251, including the amount brought forward from 1907.

NEW COMPANIES

T. E. SMITH & CO.—Registered on March 27th, with a capital of £500, to carry on the business of electrical and mechanical engineers, dealers in electric, magnetic, telegraphic, telephonic, and other appliances, &c. Private company. Table "A" mainly applies. Registered by Waterlow Bros. & Layton, Ltd., Birchin Lane, E.C.

GLOBE ELECTRIC CO.—Registered on March 30th, with a capital of £3,000, to acquire the goodwill of the Santoni Arc Lamp & Engineering Co., Ltd., formerly carried on at 11 Farringdon Avenue, E.C., to adopt an agreement with S. J. Atkinson, and to carry on the business of electrical and general engineers, contractors, manufacturers of electrical and mechanical appliances for lighting, power, and traction, &c. The subscribers are: S. J. Atkinson, 18 Palace Road, Streatham Hill, S.W., electrical engineer; E. C. Mahany, 7 Horsford Road, Brixton Hill, S.W., clerk. Private company. The number of directors is not to be less than two nor more than five; the first are S. J. Atkinson and D. L. Santoni (joint managing directors). Qualification, £250. Remuneration (except managing director), one guinea each per meeting attended. Registered by J. T. Goddard, 5 and 6 Clement's Inn, E.C.

APPOINTMENTS AND PERSONAL NOTES

Mr. Andrews, of the electricity staff of the Southend Corporation, has been presented with a diamond ring on the occasion of his leaving to take up the appointment of Chief Engineer to the lighting and tramways system in Malta.

Mr. W. Hartley, having resigned his position as mains superintendent to the Nelson Council, Mr. G. F. Nayler has been appointed to the post of chief assistant; Mr. W. M. Thomson, engineer-in-charge of the electricity works; and Mr. W. G. Coats shift-engineer.

MISCELLANEOUS CITY NOTES

COWANS.—The reduction of the capital of this company from £50,000 to £24,520, has been registered by the Registrar of Joint Stock Companies.

UNDERGROUND ELECTRIC RAILWAY COMPANIES OF LONDON.—Amongst the claims against the estate of the late Mr. C. T. Yerkes is one by the Underground Electric Railways of London, Ltd., for £160,000, which represents two calls for Mr. Yerkes' subscription to shares in the company. Owing to the inability of the creditors to secure a distribution of the assets, the London company have been successful in securing the appointment of a Receiver.

ANGLO-AMERICAN TELEGRAPH CO.—After placing £5,000 to the credit of the renewals fund, the directors recommend an interim dividend for the March quarter of 15s. per cent. on the ordinary shares, and £1 10s. per cent. on the preferred shares, less income tax.

KALGOORLIE ELECTRIC LIGHT & POWER CORPORATION.—A dividend of 6 per cent. per annum is recommended for the six months to December 31st.

MEXICO TRAMWAYS CO.—A dividend of 1½ per cent. has been declared for the quarter ending March 31st.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59 5s. (same last week).

DISSOLUTION OF PARTNERSHIP.—The partnership between J. H. Norris and J. Henderson, Jnr., carrying on business as electrical engineers at 5B Manchester Street, Oldham, has been dissolved. Debts by J. R. Norris, who continues as J. R. Norris & Co.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS UP, &c.—The last day for receiving proofs in the bankruptcy of T. A. Evans, trading as T. Arthur Evans & Co., electrical and mechanical engineer and contractor, Swansea, is April 26th. The trustee is Mr. H. Rees, Government Buildings, Frog Street, Swansea.

Mr. Registrar Hood has directed separate meetings of the unsecured creditors of the Aluminium Corporation whose respective claims amount to more than £10, and also separate meetings of the preference shareholders and ordinary shareholders. The creditors' meeting will be held on April 27th at 2 p.m. at Winchester House, London, E.C.; the preference shareholders' meeting will be at 3 p.m., and the ordinary shareholders' meeting at 3.30 p.m. on the same day.

A meeting of the creditors of Messrs. Sherard Cowper-Coles, & Co., Ltd., will be held at 82 Victoria Street, Westminster, London, on Wednesday next, April 21st, at 12 noon.

D.P. BATTERY CO.—The D.P. Battery Co., Ltd., of Bakewell, report having received orders during the past week, amongst others, for fifteen storage batteries of their country house type for various installations in the British Isles.

AGENCY.—Messrs. J. & H. Grevener, of Eldon Street House, London, E.C., inform us that they have now taken over the sole agency in the United Kingdom and the English Colonies of the Land & Sea Cable Works, Ltd. Messrs. J. & H. Grevener, of Eldon Street House, London, E.C., have recently appointed the following firms to represent them for the sale of wires and cables of every description: Davies Bros, Adelaide Street, Swansea, in Wales and the West of England; Hamilton Bros., 19 Waterloo Street, Glasgow, in Scotland.

Telegraph Traffic.—The submarine telegraph cable between Malta and Zante was interrupted on the 6th inst., and telegrams for Greece and Turkey had to be sent *via* Sicily-Otrante-Zante. The cable was repaired on 11th inst., however. The El Arich landline route also suffered some derangement on the 10th, but was put into working order on the same day. Ex-President Castro's attempt to land at Venezuela has been frustrated so far, and if General Gomez is left free to get the country into good order, the long outstanding dispute with the French Cable Co., which has been the reason of cessation of direct cable communication with that country, may be expected to reach a settlement. Telegrams to Venezuela are still subject to censorship, delay, and "sender's risk."

ELECTRIC INSTALLATIONS ON SHIPS

THE subject of electrical installations on board ship was dealt with by Mr. H. T. Boothroyd in a Paper read last week before the Liverpool Engineering Society. The author pointed out the special difficulties present, especially the effects of salt water on the insulation, and recapitulated various methods of wiring which are in use. For voltages below 110 he was inclined to favour the single wire system with ship return, and thought that the objections to this arrangement had been exaggerated. A typical installation was described, and the disposition of the main and sub-circuits, distribution boards, &c., explained. The whole of the wires throughout were of the 2,500 megohm grade, lead-covered, armoured, and braided over the armouring, where they were clipped to iron decks or bulkheads, and painted. In state rooms, &c., lead-covered wires were used, neatly clipped to the surface, and although, as a whole, the single-wire system was used, the saloons, &c., were wired with double wires back to the distribution boxes to avoid earth connection in inaccessible places. The wire to each lamp was arranged so that it could readily be renewed by using the existing wire to draw in a new wire when required. No soldered joints were used, and joint-boxes with porcelain-mounted terminals were employed. Wood-casing, the author said, was rapidly dying out. On the other hand, steel tubing, when properly arranged as regards drainage, inspection-boxes, &c., was expensive, and sometimes there was trouble with the pipes corroding through.

Passing on to the application of electric power for auxiliary purposes, the author said that electromotors were as reliable as any kind of machinery; they consumed less oil than steam engines, had no glands to pack, were much more silent, and spare parts could be substituted much more quickly than with steam engines. He was of the opinion that the whole of the auxiliary pumping on board ship could be carried out advantageously by means of electrically-driven turbine pumps. Other applications of electrical power to which he referred included turning the main engines, ash hoists, &c. The problem of electrically-driven steering gear, in his opinion, was not insurmountable if tackled without bias. The power required was intermittent; it had to be applied instantly in exact proportion to the work required, and the starting and stopping had to be automatic, and correspond to the steering wheel. In a system which he described, these conditions were achieved by a motor, coupled to the ordinary gear in place of a steam engine, taking current from a special motor-generator, but excited from the main generators. A regulating rheostat was inserted in the field of the dynamo side of the motor-generator, and also a reversing arrangement fitted, both to be actuated by means of the existing steering wheel in the wheel-house. When the steering wheel was in mid-position the dynamo field would be cut out, and the whole resistance in the shunt; as soon as the wheel was moved in either direction, the field-circuit would be made to operate in the same direction, and at the same time would commence to cut out the resistance, allowing the dynamo to generate sufficient current to operate the steering motor; as soon as the steering wheel came to rest, the motor would be stopped by means of the existing differential gear, which would cut out the field and bring the lever back to its original position as it would close a steam valve, and in the same way, if the steering wheel were moved rapidly round to port or starboard, it would cut out the whole resistance, and the motor would run at full speed so long as the steering wheel was kept moving; steps would be fitted as at present, so that the wheel could not be moved too rapidly and so injure the rheostat. Other methods had been devised, including that which had given satisfactory results on the cable-ship, *Faraday*.

There were difficulties in the application of electrical driving to windlasses and capstans, but he thought they could be overcome. Some special variable speed motors for the driving of refrigerating machinery on the *Lusitania* and *Mauretania* were then described, and the wide range of the applications of electric power on board these ships was mentioned. The advantages of electric winches were pointed out, and examples of their successful use were brought forward. After a few words on the proportioning of the generating plant to the power requirements of the ship, the Paper passed on to various other applications of electricity on board ship, such as night signalling, electric heating, and telephones. It was also stated that an electrical sounding apparatus had been patented by Mr. E. J. Watts, of the Marconi Wireless Telegraph Co., whereby soundings could be taken without the aid of a line. The subject of electric propulsion of ships was outside the scope of the Paper, and was only briefly alluded to. It was, however, stated that a system of electric drive for dredgers had been favourably considered, but the conditions were somewhat different to those obtaining on an ordinary steamer. The machinery would consist of two 1,200-kw. three-phase alternators at 2,000 volts, 50 periods, coupled to steam turbines running at 3,000 revolutions per minute, fitted with suitable switchgear to enable the turbines to be controlled from the bridge and from the engine room. The propelling motors, two in number, each 1,600 h.p. running at a speed of 250 r.p.m., were coupled direct on to the propeller shaft. Four centrifugal pumps, each taking 700 b.h.p. at 300 r.p.m., and four winches, each taking 250 b.h.p. at 500 r.p.m., were provided, but neither would these be required at the same time, nor would they be used concurrently with the propelling motors.

ELECTROMETALLURGY AND ELECTROCHEMISTRY

AT a recent meeting of the Faraday Society, a Paper was read by E. Sabersky and E. Adler on a "New Electrical Hardening Furnace." The furnace has been designed for tempering metals, and contains various molten salts as under.

Process.	*Temperature.*	*Salts.*
Tempering steel	200-580°C.	Sodium nitrate and potassium nitrate.
Annealing copper alloys, &c.	650-900	Sodium chloride or sodium chloride and potassium chloride.
Hardening carbon steels ...	750-1,100	Potassium chloride and barium chloride.
Hardening compound steels	1,050-1,350	Barium chloride.
	1,500-1,600	Calcium fluoride or magnesium fluoride.

The bath is formed with metal salts or mixtures of metallic salts, which are contained in a fire-clay crucible, the composition of the bath depending upon the temperature required. The current is transmitted to the bath by two electrodes made of Swedish ingot iron, which has a very low carbon content, and melts at from 1,500° to 1,600°. The crucible is surrounded by asbestos and a layer of insulating lagging, the whole being contained in a cast-iron case. A sheet-iron hood is placed over the bath to convey away any fumes.

The salts, like the filament of the Nernst lamp, are conductors of the second class. That is, at ordinary temperatures, they are non-conductors, but at high temperatures they freely allow the passage of the current.

The heating of the salts prior to their becoming conductive is done by means of an auxiliary electrode. A piece of arc-lamp carbon is pressed against one main electrode, when it soon reaches a white glow, and melts the salts in its immediate vicinity. The auxiliary electrode, which consists of an iron stick fitted with wooden handle, is then drawn towards the other main electrode, the molten salt trailing behind it until a bridge is established between the two electrodes, which in itself is a conductor. The current which now passes continues to raise the temperature of the bath, until the desired limit is eventually attained. The articles to be heated are then dipped into the bath, suspended from thin iron wires, or held with tongs. They are allowed to remain in the bath until they are uniformly heated throughout, and have attained the same temperature as the bath itself.

The most important feature of the furnace is the uniformity of temperature throughout the whole bath. Careful measurements with a pyrometer immersed to different depths have shown that the temperature of the bath varies only by 2-3° C.

An alternating current is employed, because if a continuous current were used, electrolysis of the fused salt would ensue. All frequencies between 25 and 60 cycles may be used; if less than 25 cycles are employed, then electrolysis ensues.

For three-phase systems a special type of furnace has been constructed, which has four electrodes instead of two. A stationary transformer converts the three-phase supply into two-phase, and each phase is connected to one pair of electrodes. The operation and performance of this furnace is quite similar to the single-phase one described before, the heating up of the salts, however, being done in one phase only. With this type of furnace the load is unbalanced for five to ten minutes only; afterwards, all phases are loaded symmetrically. The direct

Digitized by Google

application of three-phase current seems unfeasible, as hardly any bath could be devised in which the electrodes are so arranged that the potential difference between them and, therefor, the temperature, would be the same in all parts.

When the salts have become melted, the voltage necessary for maintaining the temperature is about 5–30 volts, while the heating-up voltage reaches about 70 volts. Such low voltages are not available from ordinary supply systems, and, consequently, a transformer has to be used. It is arranged for any primary voltage up to 550 volts, while the maximum secondary voltage is about 70 volts.

Comparison of Operating Costs for Hardening Furnaces.

Material to be hardened : 100 millers.
Dimensions : Outside diameter, 108 mm.
Width, 143 mm.
Weight, each = 5·25 kg.
Material : Boehler "Rapid" steel.
Hardening Process :
(*a*) Preheating period, from atmosphere temperature to 400° C.
(*b*) Main heating period, 400-1,150° C.
(*c*) Cooling.

Gas Furnace.

	£	s.	d.
12,300 cub. ft. of gas at 3s. 6d. per 1,000 cub. ft.	2	3	3
Motive power for air-blast	0	5	0
Labour, 50 hours at 8½d.	1	15	5
Total... ...	£4	3	8

Cost per miller, about 10d.
Time for total process, 50 hours.
Cost per hour, about 1s. 8d.
Millers in furnace at one time, 2.

Electric Furnace.

	£	s.	d.
200 kw. hours at 1·2d.	1	0	0
Coke for preheating	0	1	0
Salt	0	0	6
Labour, 10 hours at 8½d.	0	7	0
Total... ...	£1	8	6

Cost per miller about 3·4d.
Time for total process, 10 hours.
Cost per hour, about 2s. 10d.
Millers in furnace at one time, 1.

Dr. F. Mollwo Perkin also read a Paper upon the "Electro-Analysis of Mercury Compounds with a Gold Cathode." Mercury amalgamates readily with gold when the latter is employed as cathode, but the results obtained are uniformly too high. Although the author had carried out many tests, he was unable to account for this phenomenon. By depositing in a magnetic field, so that the electrical lines were cut by the magnetic lines, and thus the solution caused to swirl, the metal could be deposited in about an hour, instead of from four to five hours.

Other papers were by Dr. E. B. R. Prideaux, on "The Relation between Composition and Conductivity in Solutions of Meta and Ortho-Phosphoric Acids," and by Dr. F. G. Donnan on "Experiments on the Current and Energy Efficiencies of the Finlay Alkali Chlorine Cell."

NON-INDUCTIVE STANDARD RESISTANCES

An original communication entitled "Non-inductive Water-cooled Standard Resistances for Precision Alternating-Current Measurements," by Messrs. C. C. Paterson and E. H. Rayner, has been accepted for publication in due course in the *Journal* of the Institution of Electrical Engineers. The resistances described were designed to carry currents from 50 to 2,000 amperes, and range from 0·04 to 0·001 ohm. As it was desired to obtain a voltage drop of 2 volts or more across the potential points, a considerable amount of power had to be dissipated, and water-cooling had to be resorted to. The resistances are in the form of manganin tubes through which water circulates. It has been found that the smaller sizes can be loaded up to currents giving voltage drops more than double the above figure, without the temperature rise causing a change in resistance of more than 2 parts in 10,000. The watts (per square centimetre) which are dissipated in these tubes under the "maximum" load conditions vary from 7½ to 12. An upper limit of 10 watts per square centimetre may be taken as an average value for the design of manganin tubes up to 1·5 mm. thickness of wall. This corresponds to a current density of about 25 amperes per square millimetre (16,000 amperes per square inch) in tubes 0·3 mm. thick. In the larger sizes an internal glass tube is provided so that the water only flows in the annular space between this and the outer manganin tube. Measurements have shown that the effect of the resistance of the water is unappreciable. Curves are given showing the very slight increase, and subsequent greater decrease of resistance as the load rises.

The cross-section of each tube is proportioned so that a length of about 40 cms. has the desired resistance. The tubes are seamless, and are thoroughly annealed, and are silver soldered into heavy copper ends, which form the potential points, and which serve to lead the current into the tube. Each copper end has a hole through it equal to the bore of the tube, so that a stream of cooling water can pass continuously through the tube carrying away the heat, and maintaining the resistance alloy at an even temperature. The current is led in from the two terminal posts in a way which maintains a well-closed circuit, and thus avoids giving rise to fields which may affect other apparatus in the neighbourhood. A narrow ring soldered to the centre of the tube forms the common point for the volt and current circuits in wattmeter measurements with the quadrant electrometer. The insides of the tubes are cleaned with acid to remove all scale, and enamelled to prevent subsequent oxidation. An adjustment of the resistance to within about ½ per cent. is made by sandpapering the outside surface in a lathe. The tube is then soft soldered into the brass or copper end castings, and mounted. The final adjustment is then made, and the outer surface lacquered to prevent further oxidation.

The most interesting feature of the resistances is the way in which self-induction effects are avoided. The method consists in leading the potential wires back along the resistances in such a way that the magnetic flux, which causes the back E.M.F. of self-induction in the resistance, will also give rise to a practically equal back E.M.F. in the lead of the potential circuit, and so neutralise the induction effect. In order to make this elimination more complete, and also to render the calculation of the inductance possible, it is necessary that the potential lead shall take the form of a closely-fitting cylindrical sheath running the whole length of the tube and insulated from it at all points except at one end. In the tubes in question the thickness of this insulation is 0·2 mm.

It is pointed out that the only flux which can cause a self-induction effect which is not eliminated by the sheath is that which cuts the manganin tube while it does not cut the sheath, and it is shown mathematically that the self-induction due to this cause is very low. Thus for standards up to 2,000 or 3,000 amperes, the inductances may be as low as three-thousandths of a microhenry, and a correction is only necessary if a closer accuracy than 1 per cent. is desired at power factors of 0·1. With resistances for 200 and 300 amperes the correction is only 0·1 per cent. at 0·1 power factor. Experiments have confirmed the calculations as the effect of the sheath in removing over 70 per cent. of the self-induction, and calculations have shown that the effect of variation of frequency within ordinary limits is inappreciable.

An East London Electrical Exhibition.—The Hackney, Shoreditch, and Stepney Borough Councils have agreed to hold an East London Electrical Exhibition from October 18th to October 30th next. The management is to be left in the hands of Mr. C. Newton Russell, Chief Electrical Engineer to the Shoreditch Borough Council, who will have the assistance of the Electrical Engineers of Hackney and Stepney as far as possible. The Boroughs are to share equally in the expenses, and tickets of admission are to be purchased by the local authorities at their face value.

The Faraday Society.—At the general meeting on Tuesday, March 30th, the following nominations for the officers and council to be elected at the annual general meeting for the ensuing year were announced :—President : Mr. J. Swinburne, F.R.S. Vice-Presidents : Mr. G. T. Beilby, F.R.S., Sir R. A. Hadfield, F.R.S., Prof. A. K. Huntington, Dr. Ludwig Mond, F.R.S., Lord Rayleigh, F.R.S., Prof. A. Schuster, F.R.S., and Mr. Ernest Solvay. Treasurer : Dr. F. Mollwo Perkin. Council : Messrs. E. J. Bevan, Bertram Blount, A. C. Claudet, W. R. Cooper, S. Z. de Ferranti, F. W. Harbord, W. Murray Morrison, H. F. K. Picard, J. L. F. Vogel, and Dr. N. T. M. Wilsmore.

Birmingham Section of the Institution of Electrical Engineers. The following are the nominations made by the committee for the officers and committee for the ensuing session :—Past chairmen : Prof. R. Threlfall, F.R.S., Mr. R. A. Chattock, and Prof. Gisbert Kapp. Chairman : Mr. R. K. Morcom. Vice-Chairman : Mr. M. Railing. Present ordinary members of committee (remaining in office) : Messrs. V. Bornand, A. R. Everest, A. Lindsay Forster, J. P. Kemp, Colonel J. F. Lister, Messrs. A. Pearson, A. M. Taylor, and J. C. Vaudrey. Ordinary members of committee (new nominations) : Mr. J. H. Barker, Dr. M. Kloss, Mr. F. J. Moffett, and Dr. W. E. Sumpner. Hon. Secretary : Mr. H. B. Matthews. Further nominations are invited, but if none are forthcoming the above will be elected in accordance with the rules.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 8th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

7,811/08. **Automatic Speed Control of Motors.** Sir W. G. Armstrong, Whitworth & Co., Ltd., and F. Harlow. Motors the speed of which is controlled by varying the field strength of the generator are liable to stop if the torque is suddenly increased, and to prevent this it is necessary to decrease the resistance in the generator field. According to this invention, this is effected automatically by means of two rotating contacts, which, when they touch, short-circuit a portion of the field resistance. One contact is on the motor shaft, and the other is fixed to a copper disc, driven by the motor through a spring coupling. The copper disc rotates in a magnetic field. Below a certain speed, the contacts touch, but above this speed the braking effect produced by eddy-currents in the disc causes the disc to lag and the contacts to separate. Two claims, seven figures.

12,650/08. **Arc Lamp Mechanism.** Johnson & Phillips, Ltd., and S. Paterson. This feeding mechanism consists of a solenoid and plunger, a train of wheels, and a detent controlled by the regulating coils of the lamp. The plunger falls by gravity and drives the mechanism when the detent is released. When it has reached the limit of its downward movement it closes a quick-action spring switch, which closes the solenoid circuit and raises the plunger. The action is intermittent. The carbons are thus fed down positively when the detent is released, the driving power being the weight of the plunger. Four claims, four figures.

13,078/08. **Motor Starter.** E. Schattner and R. Amberton. To prevent the lever being moved too rapidly over the contacts while at the same time to ensure a quick movement from step to step, a spring-controlled pawl on the lever is caused to work in a groove provided with stepped teeth alternately projecting in opposite directions, and having alternate camming and arresting shoulders. The pawl is displaced along the camming surface of one lower tooth until it is arrested by the shoulder of the next opposite tooth; the pressure being released, it falls on to the camming surface of the next lower tooth, and so on. When the motor is stopped, the pawl turns away from the teeth, and the lever arm flies back freely. Five claims, four figures.

19,574. **Insulating Tubes.** Felten & Guilleaume Lahmeyerwerke Akt.-Ges. This is for an improved process of manufacturing insulating tubes for transformers, &c., which consists in winding dry strips of impregnated fibrous material, previously coated with mica scales and varnish, on a mandrel. During the winding the material is moistened with a volatile solvent to cause the layers to stick together. This method is quicker than that of winding the impregnated material when hot and inserting the mica at the same time. Three claims.

27,140/08. **Potentiometer for A.C. Measurements.** C. D. Drysdale. The main circuit of the potentiometer is supplied with alternating current, the phase of which can be varied by means of a phase shifter.—The principle of this instrument was described in a Paper read by Dr. Drysdale before the Physical Society. (See Electrical Engineering of Feb. 11th, 1909, page 134.)

636/09. **Motor Meter.** A. Zipplies. This invention relates to motor meters in which the armature, connected as a shunt across a resistance in the main circuit, rotates in the field of a permanent magnet. To compensate for the error due to friction, the armature is caused to move in an axial direction under the influence of the main current, so that the effective length of the armature winding and the braking action on the aluminium cylinder supporting the winding are varied with the load. In the meter described, this movement is effected by means of a solenoid in the main circuit, which acts on a core attached to the armature spindle. Two claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Crompton & Co. and Crompton, 6,421/08; Liske and Zoller, 18,832/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Immisch [Manufacture of ebonite] 28,365/07 and 28,159/08; British Vulcanised Fibre, Ltd., and Briggs [Vulcanised fibre] 6,300/08; Marks (*Dr. Cassirer & Co. Kabel- und Gumiwerke*) [Cable-drying chamber] 21,396/08.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [A.C. commutator motors] 6,961/08; Siemens Bros. Dynamo Works and Kloss [Means for obtaining smooth E.M.F. wave-forms in alternators] 12,390/08; Conrad [Transformers for vapour devices] 26,555/08; Kunkel [Machines] 404/09.

Ignition, Electric: Griffin [Sparking plugs] 21,761/07; New Ignition Syndicate, Ltd., and Sandy [Batteries] 11,035/08; Jack and Robertson [H.T. distributors for ignition systems] 11,554/08; New Ignition Syndicate, and Foster [Dry cells] 26,367/08; Hailwood [Apparatus for igniting miners' lamps underground] 839/09.

Instruments and Meters: Watson and Ashworth [Apparatus for supplying and measuring current] 17,308/08; Bonbright [Speedometers and odometers] 27,138/08.

Switchgear, Fuses, and Fittings: Stotz [Switchboards] 23,807/08; Allgemeine Elektricitäts-Ges. [Motor-starters] 28,192/08; Veritys, Ltd., and Pipkin [Regulating switches] 28,226/08; Chaudoir [Fuse-boxes, cut-outs, and switch fuses] 2,004/09.

Telephony and Telegraphy: Fessenden [Wireless telegraphy] 28,412/07; Amalgamated Radio-Telegraph Co. (*Van Der Woude*) [Wireless telegraphy] 6,953/08; Anspach [Transmission of pictures] 28,525/08; Bronée [Printing telegraph] 3,340/09.

Miscellaneous: Steinert and Stein [Electromagnetic separators] 6,323/08; British Thomson-Houston Co. (*Rupley*) [Clock winding mechanisms] 6,562/08; Felton and Guilleaume Lahmeyerwerke Akt.-Ges. [Transporting apparatus] 8,507/08; Baker and Gunstone [Mercury interrupter for A.C. circuits] 11,288/08; Sweetser [Advertising sign] 11,772/08; Snook [X-ray system] 13,854/08; Held [Heating apparatus] 15,816/08; Bishop [Testing conductivity of fluids] 19,048/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Kolemine and Juan [Heating apparatus] 3,709/09; Allgemeine Elektricitäts Ges. [Control of motors] 6,566/09; Allgemeine Elektricitäts Ges. [Polyphase relays] 6,675/09.

Expiring and Expired Patents

The following patents expire during the current week after a life of fourteen years:—

7,782 of April 18th, 1895. **High-Resistance Units.** J. F. Voigt and J. A. Haeffner. Metal, such as gold, silver, or platinum, is applied in a finely divided condition to porcelain, glass, or other insulating material, by precipitating from solutions or by the decomposition of a metallic carbon oxide. The metallic layer obtained may be strengthened by electrolytic deposition.

7,847 of April 19th, 1895. **Alloys.** W. P. Thompson. (*La Société Néo-Metallurgie Marbeau, Chaplet & Co.*) Alloys of the metals of the tungsten group with nickel, copper, iron, &c., are obtained by fusing mixtures of oxides of the refractory metal, carbon, and the alloying metal, in an electric furnace.

7,990 of April 22nd, 1895. **Printing Telegraph.** F. H. W. Higgins. A vertical row of contacts travels along the face of the type, and transmits an impulse to the receiving apparatus whenever a contact touches the metal surface of a letter. Electromagnets corresponding to the separate contacts, and actuated by the impulses, cause inking rollers to record the impulses on a paper strip.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: E. Weintraub [Working mercury-vapour lamps in series] 28,417/03.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*C. P. Steinmetz*) [Double winding rotary converters] 23,398/00; B. G. Lamme [A.C. Series commutator motor] 26,746/02.

Instruments and Meters: O. T. Bláthy [Induction motor meter] 26,377/01.

Storage Batteries: A. D'Arsonval and G. Vaugeois [Manufacture of plates] 10,191/01.

Switchgear, Fuses, and Fittings: H. P. Davis [Strip resistance coils] 28,288/02; T. Barton [Flex gripping attachment for lamp-holder] 28,303/02.

Telephony and Telegraphy: L. M. Ericsson [Jacks for telephone switchboards] 23,610/00; H. H. Lake (*J. S. Stone*) [Wireless telegraphy] 28,509/02, 28,515/02, 28,521/02, 28,549/02, 28,550/02, 28,551/02, and 28,552/02.

Traction: J. Devonshire (*W. B. Potter*) [Electric braking] 24,711/95; British Thomson-Houston Co. (*W. B. Potter*) [Control of traction motors] 25,450/99; British Thomson-Houston Co. (*H. Lemp*) [Motor and controller for automobile] 26,346/01; H. C. Stiff [Conduit switches] 28,398/02; A. H. Thornton, A. W. Shipley, and T. Mosley [Petrol-electric system for vehicles] 28,285/03.

Miscellaneous: H. P. Ball [Electrically operated music-roll perforator] 28,139/03; F. T. Snyder [Electromagnetic separators] 28,399/03

SUMMARY

The annual meeting of the Incorporated Municipal Electrical Association will be held in Manchester from June 22nd to 25th. The following subjects are among those which will be discussed:—Cheap units; metal filament lamps; steam turbines; cable systems; tramways. (Page 362.)

The grant of a patent to Siemens & Halske Akt.-Ges. for a process of removing the carbon from metal filaments, prepared by mixing the powdered metal with a carbonaceous binder, was opposed by Wolfram (Tungsten) Metal Filament Lamps, Ltd., on the ground of the existence of previous patents. The process claimed consists in heating the filaments in acetic acid vapour. After hearing evidence on both sides, the Comptroller-General has allowed the grant of the patent. (Page 362.)

The annual report of the Comptroller-General of Patents shows a decrease of 3 per cent. in the number of applications for patents in the year 1908, as compared with the previous year. The accounts show a surplus of over £117,000, in spite of increased expenditure, and a slight decrease in receipts. Considerable use has been made of the provisions of the Act of 1907. Twelve applications for revocation under Section 26 of the Act, and fifteen under Section 27, were received, some of which have already been dealt with. Patents on electrical subjects are stated to have fallen off in numbers, with the exception of those relating to metal filament lamps. (Page 362.)

The Council of the Institution of Electrical Engineers have nominated Dr. Gisbert Kapp, head of the electrical engineering department of the Birmingham University, to be President for the session 1909–10. The nominations for vice-presidents are Sir H. H. Cunynghame, Mr. Sydney Evershed, and Mr. W. Duddell. Nominations for six new members of Council are also made. (Page 363.)

A new wiring system for surface work is described on p. 364.

"A Dynamo Designer" sends us a few comments on the subject of the parallel running of three-phase alternators with earthed neutrals, with particular reference to the means adopted at Greenwich for avoiding circulating currents. He asserts that these can only be due to the presence of a third harmonic in the E.M.F. wave-form of one or more of the generators, and considers the automatic revolving switch used at Greenwich an unnecessary complication in the switchgear. (Page 365.)

Mr. J. A. Panton, in a letter, expresses different views to those of Mr. H. M. Sayers with regard to track brakes. He recommends air-brakes, and diagonally serrated blocks of cast-iron containing a percentage of carborundum. Messrs. Bellini and Tosi

Digitized by Google

write to clear up a misapprehension which has existed with reference to their system of directive wireless telegraphy. (Page 366.)

Mr. J. A. Robertson (Borough Electrical Engineer, Greenock) read a Paper last week before the Glasgow Section of the Institution of Electrical Engineers, on electricity works and refuse destructors. He dealt with various points in the design of destructor plant, and gave results of test and of the first year's working of the plant at Greenock. In the course of the discussion, Mr. W. W. Lackie expressed the view that the combination of electricity and destructor works had greater advantages in small towns than in large cities. (Page 367.)

Under "Electrometallurgy and Electrochemistry" is given a comparison between the blast furnace and the electric furnace for the reduction of iron ore, showing that whereas the former requires 700 kg. more of coke per 1,000 kg. of pig iron produced, the power available from the surplus gas is some 400 to 700 h.p. less in the latter case. Successful experiments on the utilisation of pyrites refuse from sulphuric acid works by reduction in the electric furnace have been made in Italy. (Page 369.)

A patent specification by Siemens Bros. Dynamo Works, Ltd., and M. Kloss, describing a method of winding the armatures of alternators so as to eliminate the higher harmonics from the E.M.F. wave-form, was amongst those published by the Patent Office on Thursday. The prevention of the fracture of arc-lamp economisers by providing radial slits to relieve the internal stresses is the subject of a specification by H. Liske and A. Zöller, and another by the Allgemeine-Elektricitäts Ges. relates to the starting of three-phase induction motors. By disconnecting and then reconnecting the neutral connections of the auto-transformer used at starting, the pressure is raised in three steps, the winding of the transformer acting merely as choking-coils on the first step. A patent for dynamo brushes of compressed layers of corrugated copper wire fabric, and three others by Moskowitz, Adler, and Myers for a system of train lighting with dynamos driven from the car axles, expire during the current week after their full term of life. (Page 370.)

A new primary cell, working on the principle of the Lalande cell, has just been put on the market. The new cell possesses the advantage that the copper oxide depolariser, which is pasted on to the interior of the containing vessel, can be reoxydised after each discharge by merely heating the vessel. Only the zinc and caustic soda solution need be renewed. (Page 371.)

Our Ceylon correspondent says that, although electrical energy costs 8d. per unit in Colombo, the modern high efficiency lamps are almost unknown to the public there. The poles for the reconstructed main telegraph and telephone routes in Ceylon are being manufactured locally from old railway and tramway rails, and generally there is considerable development of telephony in the island. (Page 371.)

We give a full description of the Aëro fire alarm system, together with some details of the new central call office in Queen Victoria Street, to which all the London installations will be connected. The alarm apparatus itself consists of a copper tube which is fixed all over the building, and a detector which responds to any increase in pressure caused by expansion of the air in the tube on heating. Several buildings are connected to a main circuit, and each transmits a definite code signal to the central station in the event of a fire. The means of ensuring reliable working, in spite of accidental earths or breaks in the main circuits, are explained, as well as the method of testing an installation. (Page 373.)

We are now able to publish the contents of the reports made by Mr. W. M. Mordey on the installation of the G.B. surface-contact system on the Aldgate and Bow section of the L.C.C. Tramways. In his first report, Mr. Mordey declared that the faults which had led to the suspension of the service were remediable, and his subsequent reports recorded the success of the experiments with the means which he had suggested for avoiding the difficulties, and advised the Council to continue the service, after making the modifications recommended. (Page 375.)

Major Cardew is now in Sydney to report upon extensions of the municipal electric light and power undertaking.—A Bournemouth Corporation tramcar ran away down Poole Hill last week.—The Devonport Corporation have decided to issue summonses against the Devonport & District Tramways Co. for suspending their service on the leased lines.—Another proposal to adopt the trackless trolley system in Dundee has been rejected. A Leeds Corporation Deputation, which has just returned from the Continent, are in favour of substituting a motor-omnibus service now on one of their routes by the trackless trolley system.—An agreement has been arrived at between the Oxford Tramways Committee and the National Electric Construction Co. for a combination of the conduit and overhead system in place of the surface-contact system originally intended.—The Glasgow tramways manager and electrical engineer have reported against any interference with the existing arrangements between the tramways and electricity departments for electric supply.—Further proposals are being put forward with regard to the electric railway under the River Tyne, and the directors of the North-Eastern Railway Co. are said to be interested. (Page 378).

The sum of £90,000 is to be spent upon electricity works in Lahore, India. New plant to the extent of 4,000 h.p. is to be installed by the Rosario Electric Co., and an expenditure of £100,000 upon electricity supply is contemplated in Barbados. A private telephone installation is required at the Salford Town Hall. A loan of £25,000 has been granted to the Greenock Corporation for electrical extensions. Fourteen tenders have been received by the Darlington Corporation for a 500-kw. exhaust steam turbo-generator, the prices varying from £2,000 to £4,150. (Page 379.)

The report of Babcock & Wilcox for 1908 shows a profit of £340,279. A dividend of 8 per cent. and a bonus of 4 per cent. is recommended upon the ordinary shares. A net profit of £6,882 is shown by the Melbourne Electric Supply Co. for 1908, and £11,391 by the Isle of Wight Electric Light and Power Co. A scheme for reconstructing Messrs. W. Griffiths & Co., the firm of contractors, will be placed before a shareholders' meeting on Wednesday. (Page 380.)

Our publication of the contents of Mr. Mordey's reports on the installation of the G.B. system on the Aldgate and Bow section of the L.C.C. Tramways throws some fresh light upon this unfortunate episode. It cannot fail to strengthen the impression that, in deciding to abandon the system, the Council was largely influenced by other considerations than those of engineering. When the help of the President of the Institution of Electrical Engineers was invoked, one naturally expected that the intention was to recommend the use of the system if he could indicate a satisfactory way out of the technical difficulties which had arisen. As we now see, Mr. Mordey's reports were unhesitatingly in favour of the retention of the system. His first report indicated the principal causes of difficulty, and suggested certain means by which the troubles could be avoided. Arrangements were made to test these remedies, and in further reports he speaks of their

Digitized by Google

having been fully effective. Some of his trials were made on a track covered with a specially salted slush, such as had already been known to give trouble on the ordinary conduit system, and yet he was afforded "sufficient ground for the opinion that the main or essential difficulties, namely, those which led to the stopping of the service, had been removed." The installation of the G.B. system of traction on the route in question was regarded as an experiment from the outset, and all those who read Mr. Mordey's reports will regret that the experiment should have been abruptly terminated just when the difficulties in adapting the system to the peculiarly exacting requirements of the London County Council tramways were being overcome in a satisfactory manner.

A good deal of difference of opinion has been expressed from time to time on the advisability of combining refuse destructors and electricity works, and the paper by Mr. J. A. Robertson, containing not only a general discussion of the subject, but also the results of his experience of the first year's working of the destructor station at Greenock, is of considerable interest in this connection. The criticisms which have been made against the combination of dust destructors and electricity works may be divided roughly into two divisions: those based on technical difficulties, and arguments that on economic grounds the game is not worth the candle. With regard to the first class of objections, Mr. Robertson's experience goes far to show that the difficulty of dust in the engine room, of which so much has been made, has been satisfactorily surmounted by good design, and the "nuisance" complained of in some destructor stations has likewise been obviated. The economic side of the question is not such an easy one to sum up. The whole matter appears to rest upon local circumstances. It is obvious that the more constant the load, the more economical will be the use of the fuel for the production of steam, and it is also evident that if the load is small enough to be dealt with entirely by the refuse so that no further coal-fired boilers are required, the conditions are better than if the burning of refuse only supplies a small portion of the total steam required; unfortunately, however, smallness and steadiness of the load do not always go hand in hand. Mr. Lackie, in the discussion, expressed the opinion that the combination of destructors and electricity works into a single station might be suitable in small towns, but that in large cities the condition of cartage of refuse called for a number of destructors at different points, whereas the conditions of economic generation of electric power required a single station of large size, so that the combination of the two was inadvisable.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 22nd.

Institution of Mechanical Engineers.

7.30 p.m. Anniversary Dinner at the Hotel Cecil.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster, S.W., when the discussion on Mr. Rider's Paper, "The Electrical System of the London County Council Tramways," will be concluded.

FRIDAY, APRIL 23rd.

Physical Society.

5 p.m. Meeting at the Imperial College of Science, Imperial Institute Road, South Kensington. Agenda:—(1) "On a Want of Symmetry shown by Secondary X-Rays," by Prof. W. H. Bragg, F.R.S., and J. L. Glasson. (2) "Transformations of X-Rays," by C. A. Sadler. (3) "Theory of the Alternate Current Generator," by Prof. T. R. Lyle.

North East Coast Institution of Engineers and Shipbuilders.

7.30 p.m. Meeting at the Literary and Philosophical Society, Westgate Road, Newcastle-on-Tyne, when the officers and council for next session will be elected.

Institution of Mechanical Engineers.

8 p.m. Annual General Meeting at Storey's Gate, St. James's Park, London, when Mr. J. A. F. Aspinall will deliver his Presidential Address.

Institution of Civil Engineers: Students' Section.

8 p.m. Meeting at 25 Great George Street, Westminster, S.W. Paper to be read:—"The Development of Hydro-Electric Power Schemes, with Special Reference to Works at Kinlochleven," by J. M. S. Culbertson.

Royal Institution.

9 p.m. Evening Discourse by Mr. Alexander Siemens on "Tantalum and its Industrial Applications."

SATURDAY, APRIL 24th.

Institution of Colliery and Mining Electrical Engineers.

5 p.m. First ordinary meeting at the Grand Hotel, Manchester. A cordial invitation is extended to all interested in electrical and mining matters. The chair will be taken by Mr. W. Maurice, General Manager of the Hucknall Colliery Co., Ltd.

TUESDAY, APRIL 27th.

Institution of Civil Engineers.

8 p.m. Annual general meeting, to receive the report of the Council, and to elect the Council and auditors for the ensuing year.

THE I.M.E.A. MEETING

THE annual convention of the Incorporated Municipal Electrical Association will be held in Manchester, under the presidency of Mr. S. L. Pearce, Chief Electrical Engineer to the Manchester Corporation, from Tuesday, June 22nd, to Friday, June 25th. On the evening of Monday, June 21st, however, there will be a reception and conversazione at the Town Hall by the Rt. Hon. the Lord Mayor of Manchester, Alderman Edward Holt, J.P.

The convention will be opened at 10.30 a.m. on the following morning by the Rt. Hon. the Lord Mayor of Manchester at the Municipal School of Technology, Whitworth Street. The reading of the Presidential Address will be followed by the reading and discussion of Papers. At 1.15 p.m. the Electricity Committee will entertain the Association at luncheon at the Town Hall. Special cars will be available for visits to works in the afternoon.

On Wednesday, June 23rd, the meeting will be held at Liverpool, a special train leaving Manchester at 8.55 a.m. At 10 a.m. Sir Charles Petrie, Chairman of the Tramways and Electric Power and Lighting Committee of the Liverpool Corporation, will welcome the Association at St. George's Hall, and the remainder of the morning will be devoted to the reading and discussion of Papers. After luncheon with the Tramways and Electric Power and Lighting Committee at the Exchange Hotel, visits will be paid to works in the afternoon by special cars, after which a move will be made to Pierhead for a visit to R.M.S. *Mauretania*, where the members will be entertained to tea by invitation of the Directors of the Cunard Steamship Co. The return to Manchester will be made by special train at 9.20 p.m.

At 10 a.m. on Thursday, June 24th, a meeting for the reading and discussion of Papers will be held at the Municipal School of Technology, Manchester, the afternoon being devoted to visits to works. In the evening the Annual Dinner will be held at the Midland Hotel.

The annual general business meeting will be held at 10.30 a.m. on Friday, June 25th, at the Municipal School of Technology, and visits to works have been arranged for the afternoon.

The following are some of the subjects to be discussed during the convention:—Cheap Units; Metal Filament Lamps; Steam Turbines; Cable Systems; Tramways.

Digitized by Google

The headquarters will be the Midland Hotel, Manchester, where rooms should be booked at once. Ladies accompanying the party will receive invitations to the Lord Mayor's reception on Monday. On Wednesday arrangements will be made for them to visit St. George's Hall, Liverpool, and the Walker Art Gallery, and also R.M.S. *Mauretania*. On Thursday morning they will be shown over the Manchester Town Hall and the City Art Gallery, and in the afternoon a motor trip will be arranged.

A detailed official programme will be issued in due course, and in the meantime all communications should be addressed to the Secretary, Mr. C. McArthur Butler, Staple Inn Buildings, Holborn, London, W.C.

MANUFACTURE OF METAL FILAMENT LAMPS

Unsuccessful Opposition to the Grant of a Patent

IN the month of May, 1908, application was made by Siemens & Halske Akt.-Ges. for a patent for a process of manufacturing metal filaments free from carbon. According to this process, the filament formed from a plastic mass of powdered metal and a carbonaceous binder, is connected with a source of current, and placed in the receiver of an air-pump which contains a dish holding glacial acetic acid. After a sufficient vacuum has been produced, the glacial acetic acid evaporates; if the filament is then caused to glow, the carbon is rapidly removed. The specification, which is numbered No. 11,524/08, was accepted on July 9th, 1908, and an abstract appeared in Electrical Engineering, August 6th, 1908, Vol. IV., page 225. On September 15th, 1908, opposition to the grant of this patent was entered by Wolfram (Tungsten) Metal Filament Lamps, Ltd., on the ground that the invention had been claimed in the previous British Patents, Nos. 23,899/04, and 19,379/05, and that the invention was not sufficiently described in the specification.

The first of the above patents, granted to Drs. Just and Hanaman, described a process for manufacturing metal filaments by mixing a powdered metal, such as tungsten, with a carbonaceous binding material, and then removing the carbon from the filaments formed from this mass by heating them to a high temperature in an atmosphere of steam and hydrogen.

In the second patent, granted to the Deutsche Gasglühlicht Akt.-Ges. (Auergesellschaft), limits for the proportion of oxidising gas to hydrogen were stated, and it was mentioned that nitrogen might be added.

In support of the opposition, it was stated that acetic acid, heated to from 750° C. to 1,400° C., contained a large quantity of free hydrogen and some water vapour, with other compounds, and that in consequence the applicants were actually decarbonising in steam and hydrogen, as claimed in the prior specification, as the acetic acid vapour was decomposed by the heat of the filament.

In his decision, dated April 5th, 1909, the Comptroller-General of Patents points out that the applicants may be said to have applied for a patent for an improvement in the process described in Specification No. 23,899/04, the improvement consisting in heating the filaments in an atmosphere of acetic acid vapour instead of steam and hydrogen. If the contention of the opponents were correct, this process was nothing more than a particular method of preparing an atmosphere of steam and hydrogen; but the opponents had not attempted to patent this particular method of getting an atmosphere of steam and hydrogen, and did not think it was a good method. In consequence, he is of the opinion that the patent cannot be refused. It was agreed, however, that the opposition should be met by the insertion of specific references to the two previous patents. The Comptroller made no order as to costs.

ANNUAL PATENTS REPORT

THE annual report of the Comptroller-General of Patents for the year 1908 has just been issued. In connection with the operation of the Patents and Designs Act of 1907, the Comptroller states that the new provisions have been largely made use of. The section enabling the Comptroller to grant a post-dated patent in respect of subject-matter which had been discovered by the applicant when developing his invention, or which was omitted from the provisional specification, has been made use of in no less than 265 cases. Section 16, which allows the filing of a single complete specification in respect of the inventions described in two or more cognate provisionals, has been largely adopted, and 768 applications were filed under Section 19, which enables applicants or patentees to apply for patents of addition in respect of improvements on their inventions. Section 26 empowers the Comptroller to revoke a patent upon the application, within two years from the date of the patent, of any person who would have been entitled to oppose its grant. There were 12 applications under this section. In one of the decided cases the patent was revoked, in four cases an amendment of the specification was required, and in three the application was dismissed. Under Section 27, which provides for the revocation of patents worked exclusively or mainly outside the United Kingdom, 15 applications were made. Two of these were abandoned; in two cases the patent was revoked, and 11 cases were still pending at the end of the year.

The receipts from patents fees were £262,890, as compared with £265,012 in 1907, a decrease of £2,122, and the total receipts, including fees for designs and trade marks and the sale of publications, were £297,335, as compared with £300,389, a decrease of £3,054. The total expenditure on behalf of the Office was £179,531, as compared with £176,230, an increase of £3,301. The principal increase was in the amount paid for salaries, which was £118,520, as compared with £106,869. The staff of assistant examiners was increased during the year from 177 to 189, and the total number of persons employed in the Office from 619 to 648. The numbers of readers who made use of the library in 1908 was 152,221, as compared with 148,198 in 1907, an increase of 4,023 or 2·7 per cent., and the largest number recorded in any one year.

The number of applications fell off in 1908, those accompanied by provisional specifications being 19,495, as compared with 19,568 in 1907, and those accompanied by complete specifications 9,103, as compared with 9,347. The complete specifications filed upon previous provisionals were 8,643, as compared with 9,482. The total number of specifications received was 37,241, as compared with 38,397 in 1907. Patents were sealed upon 16,060, or 55·5 per cent., of the applications made in the year 1907, and out of 12,346 patents sealed upon the applications made in the year 1895, 471, or 3·8 per cent., were maintained for the full period of 14 years. The total number of patents which expired in 1908 was 15,943, and, the total number of new patents sealed was 16,284. Thus the number of patents in force was increased during the year by 341.

With reference to Section 7 of the Act of 1907, which is a re-enactment of Section 1 of the Act of 1902, the Comptroller states that it has now been in operation for four years. During this time 6·9 per cent. of the specifications examined were reported by the examiners as having been anticipated wholly, 57·1 per cent. as having been anticipated in part, while in 36 per cent. of the specifications no anticipations were reported by the examiners. Of the cases in which anticipations had been reported 79 per cent. were amended so as to meet anticipations, such amendments being often the result of conference between the examiner and patent agent. Where the necessary amendment could not be agreed upon, it became necessary to appoint hearings, and at these hearings in 4,112 cases the specification was amended as the result of the issue of decision, and in 1,474 cases the prescribed reference by name and number to a prior patent or patents was inserted in the applicant's specification. Of 46,353 cases accepted, no less than 27,458 specifications were amended as the result of the official examination. Applicants and patent agents have been encouraged to confer personally with the examiners at each stage of the progress of their cases, and not less than 10,000 such interviews have taken place every year since the introduction of the 1902 Act.

As in former years, the subject of locomotion in general occupies a prominent position in the titles of applications for patents made during the year 1908, but the interest shown in the mechanically-propelled road vehicle is accompanied by some neglect of railway vehicles. Electrical subjects have in general fallen off in numbers, with the exception of the incandescent lamp and the primary cell. The development in railways signals of purely automatic systems and systems for giving signals in the locomotive cab still continues, but a new feature has to be noticed in the form of controlling apparatus for stopping trains in the event of excessive speed. The increasing importance of india-rubber in the industrial world is shown by attention being given to processes for the regeneration of waste rubber and the synthetic production of rubber or rubber-like products. Tungsten and like refractory metals have recently been made available for manufactures by new methods of working them in alloy-like combination with ductile metals, which are afterwards removed by heating the finished article.

THE INSTITUTION COUNCIL ELECTION

THE Council of the Institution of Electrical Engineers have nominated their candidates to fill the vacancies on the Council created by the retirements which will take place at the end of the session, in accordance with Article 45 of the Articles of Association. The president, three vice-presidents, six members of Council, and one associate member of Council will retire. These nominations will be announced this evening, prior to the ordinary business of the meeting. The retiring members are the President, Mr. W. M. Mordey; the three Vice-Presidents, Mr. F. Gill, Dr. G. Kapp (the new President-designate), and Mr. C. P. Sparks; Messrs. S. Evershed (who is now nominated as a Vice-President), J. E. Kingsbury, G. W. Partridge, H. E. Harrison, Mervyn O'Gorman, and A. A. C. Swinton. Prof. A. Schwartz, it will be remembered, resigned during the year, and was succeeded by Mr. A. H. Walton, who remains on the Council. Mr. J. Hunter Gray is the retiring associate member of Council.

The new Council will be constituted as follows, if the candidates nominated are duly elected (the new nominations are in italics):

President: *Dr. Gisbert Kapp.*

Vice-Presidents: *Sir H. H. Cunynghame, K.C.B., W. Duddell, F.R.S., S. Evershed*, Colonel H. C. L. Holden, F.R.S.

Ordinary Members of Council: *W. W. Cook, G. K. B. Elphinstone, W. Judd, W. M. Morrison, J. H. Rider, C. H. Wordingham*, Dr. E. Hopkinson, J. W. Jacomb-Hood, T. Mather, F.R.S., Major W. A. J. O'Meara, C.M.G., W. H. Patchell, W. Rutherford, J. F. C. Snell, G. Stoney, A. H. Walton.

Associate Members of Council: *E. Russell Clarke*, H. Human, J. E. Taylor.

The Honorary Treasurer, Mr. Robert Hammond, and the Honorary Auditors, Messrs. H. Alabaster and Sidney Sharp, are eligible for re-election.

If there are any alternative nominations, these must be made by two members, supported by eight other members, and sent in to the Secretary by Thursday next, together with the written consent of the nominee to accept office if elected. In the event of no alternative nominations being received by Thursday next, the Council's nominees will be declared duly elected at the annual general meeting on May 20th.

Of the Chairmen of Local Sections who are *ex-officio* members of Council, only two, so far, have been chosen; Mr. S. J. Watson, chief electrical engineer to the Bury Corporation, will represent the Manchester Section, Mr. R. K. Morcom the Birmingham Section, and the remaining Chairmen have still to be announced.

Dr. Gisbert Kapp,
(President-Designate of the Institution of Electrical Engineers, 1909-10.)

Prof. Gisbert Kapp, who is the first occupant of the Chair of Electrical Engineering at the Birmingham University, to which he was appointed at the end of 1904, is an Austrian by birth, but became a naturalised British subject in 1881. With the exception of ten years, from 1894 to 1904, when he was filling important appointments in Germany, practically all Prof. Kapp's professional work has been in England. He came over to this country in 1872 at the age of 20, and his first job was at Messrs. Gwynne & Co.'s works as draughtsman. In the early 'eighties he joined Col. Crompton, and was associated with him during the early stages of the development of his firm. Later he acted independently as a consulting engineer, and undertook a considerable amount of journalistic work. From 1894 to 1904 Prof. Kapp was secretary of the Verband Deutscher Elektrotechniker in addition to holding the editorship of the *Elektrotechnische Zeitschrift*, and being a lecturer at the Charlottenburg Technical School. Prof. Kapp is the author of many books, and has contributed numerous Papers to engineering societies. He has served three times on the Council: from 1891 to 1893, in 1905-6, and was Vice-President from 1907 to 1909.

Sir H. H. Cunynghame, C.B., one of the new vice-presidents, holds the official position of assistant secretary (legal) to the Home Office, but he has taken a great interest in scientific matters in general, and electrical engineering in particular. He was chairman of the Departmental Committee, which in 1904 considered the drafting of rules governing the use of electricity in mines, but probably on the electrical side he is best known for his work in connection with the application of electricity to clocks, for which he has taken out a number of patents.

Mr. W. Duddell, F.R.S., who is also nominated for a vice-presidency, is the well-known inventor of the oscillograph. He has, in addition, made many investigations on the subject of surges in cables, and more recently has also been doing good work in connection with wireless telegraphy and telephony. He has already served twice on the Council: as Associate Member of Council, from 1900 to 1903, and as a member of Council from 1905 to 1908. He has been President of the Röntgen Society, and Vice-President of the Physical Society, and was one of the secretaries to the International Conference on Electrical Units and Standards, which was held in London last autumn.

Mr. Sidney Evershed, the other nominee for a vice-presidency, is managing director of Messrs. Evershed & Vignoles, Ltd., the electrical instrument makers. He served as Associate Member of Council from 1897 to 1900, and as Member of Council from 1906 to 1909.

Of the new nominees as Members of Council, Mr. W. W. Cook, who is Assistant Engineer-in-Chief to the National Telephone Co., and Mr. W. M. Morrison, managing director and technical adviser to the British Aluminium Co., Ltd., are new-comers, neither having served on the Council in any capacity previously. Mr. J. H. Rider, Electrical Engineer to the L.C.C. tramways, was previously on the Institution Council from 1900 to 1903. Mr. G. K. B. Elphinstone, of Messrs. Elliott Bros., served as Associate Member of Council in 1893-4, and Mr. Walter Judd, Electrician-in-Chief to the Eastern & Associated Telegraph Companies, was a Member of Council from 1904 to 1907. Mr C. H. Wordingham, Electrical Engineer-in-Chief to the Admiralty, has already been on the Council for three periods of three years.

The new nominee as Associate Member of Council, Mr. E. Russell Clarke, has specialised in patent cases at the Bar, and at the moment is much occupied on electrical cases under the New Patents Act.

A NEW WIRING SYSTEM

Surface wiring for houses is rapidly coming into favour, especially for small installations, in which a heavy initial expenditure on the wiring would put electric light out of court. As the result of the introduction of metal filament lamps, electric lighting has become as cheap, if not cheaper, than gas lighting, even if its contingent advantages are overlooked. There are consequently a far greater number of small householders and shopkeepers—the so-called six- and twelve-light men—than hitherto who are using electricity, but the cost of an installation drawn into iron pipes or laid in casing would in many cases be prohibitive.

The latest surface-wiring system introduced is the "Simplex flexible system," supplied by Simplex Conduits, Ltd., of Garrison Lane, Birmingham, and 116 Charing Cross Road, London (with branches in Glasgow, Newcastle, Liverpool, and Bristol). It possesses several advantages over the ordinary method of fixing unprotected flexible cords on insulating knobs, and it should be very little more expensive in first cost, for the labour cost should be about the same and the extra cost of the material only slightly greater.

Three alternative types of cable are employed. The first of these is an armoured flexible twin cable, illustrated in Fig. 1. The conductors in this are of 20/36 copper. Each conductor is first covered with a lapping of cotton, and then with three laps of pure rubber, over which is another lapping of coloured cotton, red for the one pole and green for the other. Worming is inserted between the two wires to make the cable circular, and the whole is covered by a close waxed braiding and then armoured with close braiding of No. 36 gauge tinned-iron wires, lapped six-ply. The overall diameter is 5/16 of an inch.

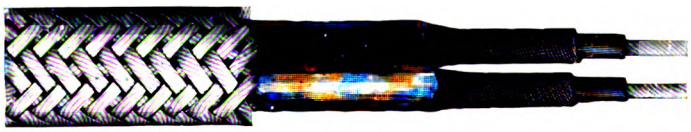

Fig. 1.—Armoured Flexible Twin Cable. (About twice full size.)

In the second form of cable, the armouring is replaced by a close braiding of white flame-proofed cotton material, which may be painted after erection to match the decorations, and, it is stated, resists the attacks of lime wash. This outer braiding contains no asbestos, a material which is known to be very hygroscopic.

The third type of cable has an ordinary cotton covering in place of the armouring or fire-proofed braiding. The external covering of this has a maroon colour, but the company offers to supply other finishes at short notice.

The flexible cord is attached to the wall by neat brass clips, one of which is shown in Fig. 2. The clip is attached by means of three brads, and the cable simply sprung into position. When erecting on brick walls, a similar clip with a steel dowell is used in place of this. When passing through walls the flexible, whether armoured or otherwise, should be protected, and the company recommend that this should be done by a short length of compo pipe, the ends of which are chamfered away after the wire has been run through.

The only accessory required is the company's standard circular iron box, which is so constructed that it can be used as an outlet for an ordinary pendant, with or without a ceiling rose, and it will take a switch or wall plug, or a fibre disc for any special fitting, or, finally, it may be used simply as a junction box.

This box, with its cover removed, is shown in Fig. 3. Four blank bosses are provided, so that it may be used either as a terminal through three- or four-way box. In sending out the boxes, one, two, three, or all the ways can be drilled and tapped for the inlet nipples, but the company recommend that all four bosses should be drilled and tapped, and each inlet fitted with a small screwed plug, so that only one kind of box need be sent to the installation, even if the precise requirements are not known beforehand. The internal dimensions of the boxes are $2\frac{3}{8}$ in. by 1 in. The nipple is constructed in two separate parts: a screwed brass nipple of half an inch diameter, which is screwed into the inlet of the box, and a screwed sleeve, resembling in shape an ordinary cord grip. The wire is cut off exactly to the length required, and the armouring or outer braiding is trimmed back so that it butts against a lip on the interior of the nipple. When bringing in the armoured flexible a lapping of soft lead wire is placed round it, and the screwed sleeve presses this down, the jambing action ensuring a good electrical connection between the armouring and the box. In the case of the flame-proofed and cotton-covered wire, this jambing action is produced by a small rubber band, which is placed over the outer braiding.

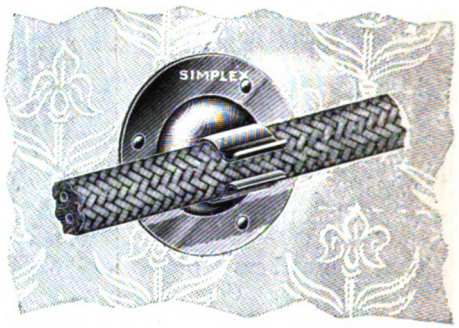

Fig. 2.—Flexible Cord Clip (about full size).

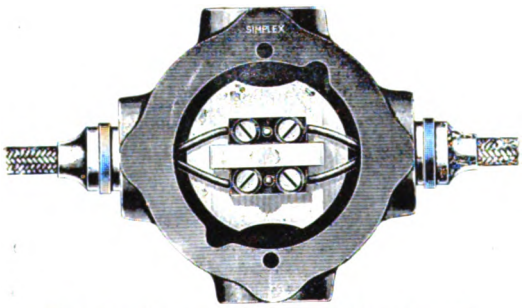

Fig. 3.—Standard Circular Box ($\frac{1}{2}$-size).

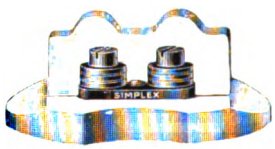

Fig. 4.—Porcelain Interior.

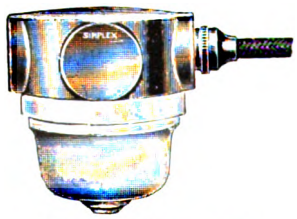

Fig. 5.—Box with Ceiling Rose.

Fig. 4 shows the type of porcelain interior supplied for use with the junction box. It will be seen that three washers are used. The screw is a solid cheese-head screw, and the thread does not extend to the upper portion. Fig. 5 shows the box fitted with a ceiling rose.

A specially cheap line of linked tumbler switches and ventilated fuses has been specially designed for use with the Simplex armoured flexible system of wiring. The switches and fuses are mounted on a fibre-covered box into which the wires are led in the same way as into the ordinary junction box which we have described.

From the above description it will be seen that the system has been completely standardised throughout, and that there is only one size of wire and one type of accessory. It is also evident that the system lends itself very easily to extensions and alterations, and these facts, together with the advantage of low cost, will be appreciated by wiring contractors.

PARALLEL RUNNING OF THREE-PHASE ALTERNATORS WITH EARTHED NEUTRALS

(By a Dynamo Designer)

MR. J. H. RIDER, in his recent Paper before the Institution of Electrical Engineers (ELECTRICAL ENGINEERING of April 1st, page 300), referred to some troubles he had experienced at the Greenwich generating station, on connecting the neutral points of the star windings of the alternators to a common earthing point. The experience, he said, had been similar to that at other places, viz., that when more than one machine was running, heavy local currents, having a frequency equal to three times the normal, were set up between the various machines through this earthing connection; moreover, if an earth occurred on the external high-pressure system, the voltage of the whole station was brought down by the heavy resulting current, pending the opening of the time-limit circuit-breaker. A resistance was first used in the earth connection to limit this current, but this had to be very low to make the action of the circuit-breaker certain, and, of course, did not prevent the interchange of currents through the neutral connection. Earthing each machine through its own resistance would have been more costly, and would also have introduced a risk of charging the standing machines to a high pressure under certain possible but remote conditions. It was therefore decided to connect the neutral of only one machine to the earthing resistance, and an automatic switch was designed by means of which, if any machine which had its neutral point connected to earth were shut down, another machine was immediately connected. In the course of the discussion (see ELECTRICAL ENGINEERING of April 8th, page 334), Mr. G. W. Partridge said that he was inclined to think that the troublesome interchange of currents between the machines had something to do with the design of the generators, and pointed out that there were a great many three-phase generating stations which had the neutral points all connected up solid; he had himself, he said, four machines at Deptford connected in this manner, and they gave no trouble. On the other hand, Mr. O'Brien stated that at the Formby station of the Lancashire and Yorkshire Railway, although he obtained no currents through the neutrals with four reciprocating engines running in parallel, he did obtain considerable cross-currents when a turbo-alternator was put in parallel with them. He had no difficulty, however, in working with all the neutrals of the machines connected up solid to an earthed bus-bar.

Now, as a means of avoiding the interchange of currents between the machines, the arrangement adopted appears to the present writer to be an unnecessary and complicated addition to the station switchgear, as the causes of such circulating currents are well understood, and can be eliminated by slight alterations to the generators. In his opinion, the circulating currents in question, with a frequency of three times the normal, can only be accounted for by the presence of a pronounced third harmonic in the wave-form of one or more of the generators, as it is a law of the three-phase circuit that a third or ninth harmonic cannot exist in the wave-form of the E.M.F. between the lines. It is true that, somewhat over three years ago, Mr. R. C. Clinker published the results of some experimental work which showed that, in the case of three transformers connected in star and supplied from a three-phase circuit, the E.M.F. wave across the transformers must contain a third harmonic, and that the E.M.F. per transformer and consequently the iron losses, were not what would be expected. But this third harmonic, which is manufactured by the transformers, cannot reach the generator, and nor can any third or ninth harmonic which may be produced in any way outside the windings of the generator itself.

At any instant, the resultant E.M.F. from the three phases of a three-phase generator is zero at the neutral point so far as the fundamental wave is concerned, but if the E.M.F. wave contains a third harmonic, there is a resultant E.M.F. equal to that third harmonic. If the neutral point is connected to an earthed bus-bar, and any number of other machines are put in parallel with the first machine and also earthed, the windings of these machines form local circuits for this third harmonic to produce local currents of the same frequency. If the paralleled machines have the same wave-form, no current will flow in the local circuits, as the E.M.F.'s will balance; but if one or more of the machines has a different wave-form, there will be a resultant E.M.F. in the local circuits, and heavy currents will flow as the resistance is low.

It may be mentioned also that, in the case of a single machine working on a cable network, a third harmonic in the wave-form will cause a current to flow through the earth connection and the capacity of the cable network, but this current will only be excessive if the natural frequency of oscillation of the network happens to correspond with that of the harmonic.

The presence of a third harmonic in the E.M.F. wave-form of an alternator can be avoided by careful distribution of the stator winding, and suitable shaping of the pole tips of the rotor, and there are many reasons, besides the particular one in question, why the wave-form should be as nearly as possible a sine curve. It would appear to be far more desirable to ensure that all the machines in a station had approximately the same wave-form, and as nearly as possible a sine wave-form, than to introduce an automatic switch of the pattern described, quite apart from the extra cost of the arrangement. Mr. Partridge's four machines were doubtless all of the same pattern, and so also were the four reciprocating sets of Mr. O'Brien, and in that case, however many machines were put in parallel, the third harmonics, if there were any, would neutralise each other in the different local circuits. Directly a machine of different pattern is introduced, however, as in the case of Mr. O'Brien's turbo-alternator, circulating currents result, as all the third harmonics of the other machines work in parallel on the windings of the new machine.

Although Mr. O'Brien stated that these circulating currents gave no trouble, it must be remembered that they reduce considerably the overload capacity of the machines as they heat up the windings unnecessarily. Owing to the high inductance of the local circuits, they are practically wattless currents, but the C^2R losses may be considerable. It is not easy to alter the wave-forms of existing machines, but it is quite possible, and it seems to the writer that this would be the best way of avoiding such circulatory currents as those experienced at Greenwich.

The second trouble experienced by Mr. Rider has, of course, nothing to do with the third harmonic in the wave-form, but is due entirely to the fact that a low resistance circuit to earth is provided by the earthing connections. When an earth appears in one phase of the external circuit, there is a complete earth circuit

Digitized by Google

through the neutral and the fault, and a heavy current flows. If all the neutrals of the paralleled machines are connected solid to a bus-bar which is earthed through a resistance, the earth current will flow through the one phase of each machine, and then through the single earth resistance. If they are all connected through resistances to an earthed bus-bar, the current will flow through all the resistances in parallel. If, however, only one neutral is earthed, as in Mr. Rider's arrangement, the earth current will flow through the one phase of the earthed machine only, and will consequently be less than in the former cases, as the resistance of the circuit will be more; also, the terminal pressure of the remaining machines will be practically unaffected. But if the trouble with the local currents between machines has been overcome, as it should be, by alterations to the pole-tips of the machines, or has been avoided by proper design at the outset, it seems hardly sufficient reason for introducing the extra complication of the automatic revolving switch merely to guard against this second trouble, which only occurs during the short period between the occurrence of an earth on the feeder system and the operation of the time-limit relay.

CORRESPONDENCE

TRACK BRAKES.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I note with interest Mr. H. M. Sayers' remarks on the above subject in your issue of April 1st. In summing up the reports recently issued by the two Brakes Committees, the net result is as confusing as the conflict between the committees.

The "Frood's block" mentioned as being used in London is not available for use outside a tube railway. On a wet or greasy rail it is impossible for the driver to find the station, another disadvantage being, in the event of an emergency stop, the liability of the blocks to get on fire, the material being principally composed of old cotton belting. Your correspondent is inclined to favour wood blocks, notwithstanding their rapid wear and inefficiency on a greasy rail, in preference to the higher co-efficients obtained under the same conditions with serrated cast-iron blocks. The efficiency of the ordinary cast-iron brake block is fairly well-known now, and also that its co-efficient of adhesion decreases as the temperature of the block increases, the next step of importance taken by the manufacturers being a specially hard and close-grained cast-iron block—chilled in places—which gave decidedly better results in accordance with a decreased temperature rise.

Therefore, a block diagonally serrated not only offers extra cutting edges, but cleans off the grease or mud, at the same time retaining an even temperature, and correspondingly offers a uniform co-efficient of friction to the rail. Add to this the fact that a percentage of carborundum can now be added to the cast-iron, to suit the various conditions of rails and localities, it follows that we have now got the right slipper block, that can be manufactured for service or emergency purposes as required.

The value of carborundum is well-known as a rail grinder; be it wet, greasy, or otherwise, it will bring the car to a standstill even with the power left full on. It has a like value in stopping a runaway car when occasion arises, and that is the object to be attained, regardless of any small outlay on rail wear. The life of a rail is determined by the life of the joint; the use of serrated cast-iron slipper blocks will tend to preserve the life of the joint, therefore the whole track will be improved.

Having arrived at the right block, the method of application deserves as much consideration. Simple mechanical means have given the most reliable results, though harsh in action and severe on drivers. To obviate this, we have the air brake system, which can be manipulated with ease, the tendency to skid wheels being greatly decreased by the cushioning effect which the air-cylinder pistons have on the brake rigging. The problem of unit vehicle control is simple where the straight air system can be applied, and, once installed, the maintenance is cheaper than electrical or other power control. A brake of the description herein described will practically obviate the use of sand, and will reduce the importance of the human element to a negative quantity.

Yours faithfully,

J. A. PANTON.

Overhead Railway, Liverpool.

DIRECTIVE SYSTEMS OF WIRELESS TELEGRAPHY.

(Translation.)

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In the second edition of his "Handbook of Wireless Telegraphy," Dr. J. Erskine-Murray commences the description of our system with this sentence: "On the basis of Prof. Artom's patents these inventors have constructed a most elegant and apparently efficient system of directive telegraphy."

We should feel much obliged if you would publish the following correction.

Our system differs from all the other directive systems in that, with all these latter, it is necessary to actually turn the aerial in order to effect communication in different directions; whilst in ours, by utilising the principle of the composition and resolution of the electromagnetic fields, this rotation is avoided, and the aerial is permanently fixed. The Artom system requires, like the others, that the aerial should be rotated.

The aim of the systems due to Artom, Brown, Blondel, and others was to produce a *directive* aerial. The object of our work was not to discover a directive aerial, but to render possible the employment of any of the types of known directive aerials, which, however, were not practically realisable owing to the impossibility of actually rotating the aerial. Had the Artom aerial given good results, we should have been able to profit by using it for our system; but since it did not succeed, it is not usable, either by itself or by our system. We might recall the fact that Prof. Artom wished to obtain directivity of the waves by the employment of circularly or elliptically polarised waves, which should propagate themselves chiefly in a *direction perpendicular to the plane* of the aerial.

In our experiments we used a Brown's aerial or our unilateral aerial, which utilise Hertzian waves radiating mainly *in the plane* of the aerial. It follows that the basis of our system has nothing in common with the basis of Prof. Artom's system.

Dr. Erskine-Murray was perhaps led to take this mistaken view owing to the circumstance that the stations at Dieppe, Havre, and Barfleur which served for the fruitless trials with the Artom system, were afterwards used for the experiments with our system.

Yours, &c.,

E. BELLINI and A. TOSI.

Turin, April, 1909.

16-c.p. Tungsten Lamps.—Messrs. G. M. Boddy & Co. inform us that they have succeeded in placing on the market 16-c.p. "Metalik" lamps of from 100 to 135 volts, and 32-c.p. lamps at 200 to 260 volts. They are prepared to book orders for these lamps in lots of 50 and upwards at the prices of 3s. and 4s. 9d. each, subject to their usual discounts.

Electrical Standardising, Testing, and Training Institution.—As the result of the examinations held at Faraday House on April 5th, 6th, and 7th, the following awards have been made:—Richard Willan, of the Municipal Secondary School, Widnes, Lancashire, a Faraday Scholarship of Fifty guineas per annum, tenable for three years; Cyril L. Underwood, of Bedford Grammar School, an Extra Entrance Scholarship of Thirty-five guineas per annum, tenable for three years; John R. S. Hawker, of the Goldsmiths' College, New Cross, London, S.E., an Entrance Exhibition of Twenty-five guineas per annum, tenable for three years; Roger Brunton, of Wellingborough Grammar School, a special Entrance Prize of Twenty guineas.

ELECTRICITY WORKS AND REFUSE DESTRUCTORS

MR. J. A. ROBERTSON (Borough Electrical Engineer, Greenock) read a Paper last week on the above subject before the Glasgow Section of the Institution of Electrical Engineers. The Paper embodied some of his experiences of the first year's operation of the combined refuse destructor and electricity works at Greenock, which was fully described in ELECTRICAL ENGINEERING, Vol. III., p. 263. Mr. Robertson said that although the first combination of a destructor with a municipal electric supply undertaking took place at Shoreditch so recently as 1897, there were now no less than 72 such undertakings in this country in operation, and these are being added to at the rate of about 20 per annum. In proceeding to outline some of the conditions desirable for the successful operation of such a works, the author emphasises the importance of a steady demand. Unless steam from the destructor can be utilised during the greater portion of the 24 hours, it will be necessary either to provide sufficient furnace capacity to burn a day's collection in a comparatively short period of time, storing the material as it is delivered, or to bye-pass the hot gases from the furnaces direct to the chimney, a course objectionable owing to their high temperature. Thus, in general, undertakings with power and tramway loads are more suitable for the combination than works with a lighting load only. Neither thermal nor electrical storage had made much headway for levelling up the load.

The refuse varies greatly, both in calorific value and in quantity in different districts and during different periods of the year. Fig. 1 shows the variation in delivery at Greenock during different periods of the year, and as the quantity of

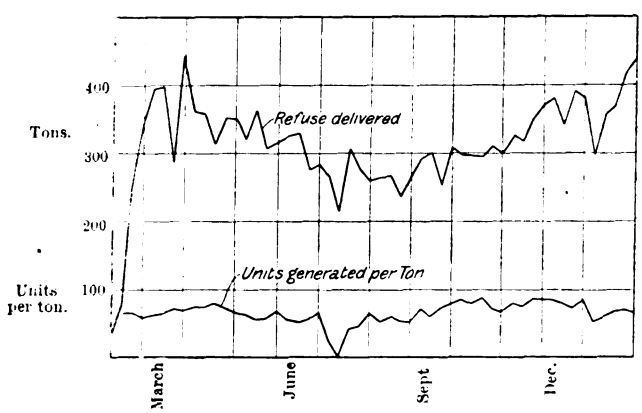

FIG. 1.—REFUSE DELIVERED AND UNITS GENERATED PER TON, YEAR ENDED JANUARY 31ST, 1909.

ash pit refuse is less in summer, it will be seen that the value of the whole delivery is correspondingly reduced, so that while it is possible to obtain results as high as 86 units per ton in October, the figure in July falls as low as 24 units per ton. There were difficulties in reinforcing the refuse with low-grade coke or coke dust, and the great difference in the quality of the refuse delivered constituted the most serious difficulty, entailing the use in some cases of coal-fired boilers to ensure steady steam pressure at the engines. The dust difficulty could be avoided by a suitable arrangement of buildings, and the author stated that at Greenock, no real trouble had been experienced from this cause. The points which call for special attention in the design of destructors are the charging or feeding of the refuse into the furnaces, the system of forced draught employed, the design of furnace and combustion chamber, and the position and type of boiler. The various systems of hand-charging were classified as follows:—Front shovel feed as in the Meldrum destructors; back shovel feed, as largely employed by Messrs. Heenan & Froude, and the Horsfall Destructor Co.; and top-feed, as exemplified by an installation erected by Messrs. Hughes & Stirling at Isleworth.

The great drawback to all hand-fed systems is the inrush of cold air which takes place during the time required for charging, and the consequent reduction in temperature of the furnace brickwork, also the heavy cost of labour. The earliest system of mechanical charging is that of Bulnois and Brodie, employing movable iron trucks.

The system adopted at Greenock is the automatic "tub-feed" system, which found favour chiefly on account of its sanitary advantages. In this system the refuse is tipped from the collecting carts into tubs or skips, each skip containing one load. The skips are then lifted by an electric crane and deposited on a storage platform, where they are kept till required for charging. This platform is erected over the clinkering floor, and is separated from the furnace brickwork to ensure cool storage. To charge a furnace, the skip is lifted from the platform by the crane and is placed on a movable cradle directly over the furnace opening, which is fitted with a water-sealed door. When released by the crane, the weight of the skip operates a system of levers and a balance weight in such a way as to lift the water-sealed door off the furnace and draw it to one side, permitting the cradle to descend to the mouth of the charging door. The bottom of the skip consists of two hinged doors suspended so that when the skip reaches the proper position the doors open outwards, and the contents of the skip are deposited directly into the furnace. The crane then lifts the empty skip, and the water-sealed door actuated by the balance weight is drawn back to its seat.

Destructors can be divided roughly into two groups: those in which the cells are isolated from each other, and the gases led into a common combustion chamber, and those in which several grates are grouped into a common furnace, with separate firing doors and ash-pits provided for each grate. An advantage of the unit system, which is used by the Horsfall Destructor Co. and other makers, is that one unit can be shut down for repairs without affecting the operation of the other.

The object aimed at is the maintenance of high temperature in the products of combustion utilised for steam raising, and to obtain this it is essential with both types of construction that a large combustion chamber be provided *beyond* the furnaces, where all gases may be finally intermingled and cremated before coming in contact with the boiler. The second function of the combustion chamber is to trap as much as possible of the dust liberated from the furnaces, and as considerable trouble is experienced owing to the deposition of dust and grit on boiler tubes, and to the choking of the flues from the same cause, it is desirable to construct the combustion chamber with a settling pit of large capacity, suitable access doors being provided for periodical cleaning.

The position of the boilers with relation to the cells is an important factor in the maintenance of high temperature. In some designs the boiler is sandwiched between two cells, the gases from the fires passing through side openings into a combustion chamber directly beneath the boiler tubes. At first sight it would appear that by bringing the boiler close to the fires the maximum heat available will be absorbed and radiation losses avoided; but the placing of such a large area of boiler surface at a comparatively low temperature in close proximity to the fires actually tends to retard the process of combustion. The better practice is to place the boiler beyond the combustion chamber, so that the green gases from newly charged refuse in passing through the chamber will combine with a large volume of higher temperature gases, thus becoming thoroughly mixed and cremated before they are brought into contact with the comparatively cooler surfaces of the boiler.

The Paper then passed to a consideration of methods of providing the necessary forced draught, and the relative merits of steam jets against fans, and it was stated that whereas steam jets consume from 10 to 15 per cent. of the steam generated, only 4 to 5 per cent. is required for low pressure steam-driven fans. The advantages of hot-air draught were emphasised, and several methods of air heating were described. With regard to the pressure employed, it was mentioned that the Greenock plant was originally designed for a pressure of 9 to 12 in., and it was found possible with this pressure to work with fires from 18 in. to 2 ft. in thickness. The fire-grate is formed of solid iron bars perforated with numerous small holes through which the air is forced into the refuse. The experience gained after a few months' experimental working led finally to the adoption of an average pressure of 6 in., which appears to suit the varying conditions as efficiently as the higher pressure, with the advantage of economising the amount of power absorbed by the fans.

Mr. Robertson considered that the Lancashire boiler possessed special advantages for destructor installations, inasmuch as its larger steam and water capacity compensate to some extent for the temperature variations due to unequal quality of the

Digitized by Google

fuel. The water-tube boiler, while responding quickly to any rise in temperature, loses its temperature quite as rapidly. It is usual to provide auxiliary coal-fired grates, with destructor boilers to increase the duty at times of abnormal demand; but the author has found that the presence of hot gases from the destructor furnaces retards the process of coal combustion, and the actual benefit of the auxiliary coal-fired grate lies in the use which can be made of it when, through any reason, the destructor furnace is out of action. The experiment of forcing the boilers by mixing a charge of refuse with a smaller charge of coal in the destructor furnace was not a success, for on cleaning out the fires the coal was found only partially burned, the remainder being embedded in the clinker, which had apparently protected it from combustion.

In the Greenock installation the marine type of water-tube boiler is employed, and the hot gases from the destructor are passed once through the tubes in an upward direction, the superheater being placed between the upper and the lower sections.

The Paper then passed on to deal with financial results about which there is a good deal of difference of opinion. There was no doubt whatever, said the author, that the calorific value of ordinary town's refuse was sufficient to produce a considerable amount of steam if burned under proper conditions. In Liverpool, where 600 tons of refuse are burned every day, no less than 9,209,369 units were generated from destructor steam during 1907, and this result has been obtained with non-condensing compound engines, using 50 lbs. of steam per kilowatt-hour. In addition to the destructor plant, the equipment of the Greenock works comprises two coal-fired boilers, and the generating plant consists of two 750 kw. and two 400 kw. Bellis-

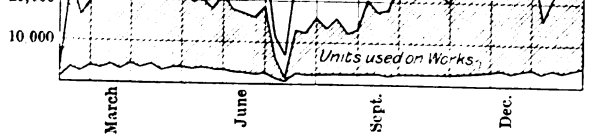

Fig. 2.—Curves showing Units Generated, &c., during year ended January 31st, 1909.

Westinghouse continuous-current sets with steam superheated to 500° F., and a 26 in. vacuum. Under working conditions the average steam consumption, including all losses, is 26·5 lbs. per kw.-hour. The units used on works (not including units used on destructor) amount to 1·9 per cent. of the units generated. Fig. 2 shows the total output of the works during the year ended January 31st, 1909, the shaded portion representing the proportion generated by destructor steam, and the lowest line the amount of energy used by the destructor for power and light. This latter amounts to 12 per cent. of the destructor generated units, divided up as follows:—Fan draught, 8·5 per cent.; cranes, 1·0 per cent; clinker treatment, 1·4 per cent., and lighting 1·1 per cent.

With regard to the vexed question of the price to be charged to the destructor for energy supplied, Mr. Robertson is of opinion that the proper way is to treat the destructor in exactly the same way as another consumer with a similar load factor, making due allowance for the absence of distribution sets. On this basis the price arrived at was 0·6d. per unit estimating, the load factor being estimated at 35 per cent.

Some particulars of an eight-hour test of the Greenock destructor plant are given, which show the following results:—

Total water evaporated per square foot of heating surface per hour, 2·43 lbs.

Total water per lb. of refuse burnt, 1·11 lbs.

Total units generated, 3,101·5.

Units per ton of refuse, 97.

The total capital cost of the destructor, including one-half cost of site, one-half of chimney, buildings, furnaces, plant, economiser, proportion of steam and feed piping was £19,800.

The following table summarises the working cost, &c., for the year ended January 31st, 1909.

Revenue Account.

Expenditure.

	£	Per Ton. s.	d.
Labour—			
Operating destructor	936	1	1¼
Treatment of residue	134	0	2
Repairs—			
(*a*) Buildings	40	0	2¼
(*b*) Plant	120		
Disposal of unsaleable residue ...	135	0	2
Power and light	330	0	4½
Rates, taxes, insurance	83	0	1¼
Management	65	0	0¾
Total	£1,843	2	2

Credit.

Sale of steam	1,665		
Sale of clinker	65		
	1,730	2	0¼
Balance to Net Revenue Account ...	113	0	1¾
Total	£1,843	2	2

Net Revenue Account.

Interest on £19,800 at 3½ per cent. ...	696	0	9¾
Sinking fund, $\frac{3}{10}$th of capital ...	663	0	9¼
Balance from Revenue Account ...	113	0	1¾
Net cost of disposal	£1,472	1	8¾

During the year 16,995 tons of refuse were destroyed, producing 1,142,064 units from destructor steam, 132,006 units were used for power and light, and the units generated per ton of refuse were 67·2; 5,338 tons of clinker were produced, of which 1,286 tons were sold.

Mr. Robertson sums up his conclusions as follows:—That, given a suitable design of plant, ordinary town's refuse may be destroyed at a combined works without giving rise to nuisance troubles, always provided that the sanitary object of the destructor is considered of primary importance. That where local conditions permit the steam to be utilised for at least nine hours per day it will be a distinct financial advantage to combine the electricity works with the refuse destructor. That a combined scheme should only be undertaken after careful investigation and under expert advice. That in the interests of efficiency the combined installation should be under the control of the electrical engineer. That the financial adjustment between the electricity and cleansing departments should be made on the basis of value supplied, including saving in capital expenditure and labour costs (if any).

DISCUSSION.

Mr. W. W. Lackie (City Electrical Engineer, Glasgow), in his opening remarks as Chairman, said that although in small places like Greenock the combined plant described could be satisfactorily used, it would not, in his opinion, be commercially advisable to carry out the scheme in large cities such as Glasgow. In such cities the whole of the refuse could not be carried economically to one or two points, and the objections to the installation of six or seven small stations were obvious. He calculated that the Glasgow sanitary authorities could only supply sufficient steam for about 1,800 h.p. He thought that the proper province of destructor steam-raising plants was that of the supply of steam to public baths, &c.

Prof. F. G. Baily said that there seemed to be room for a specially designed boiler for such work, and asked whether the capital expenditure of £19,800 included the boilers.

Mr. F. A. Newington (City Electrical Engineer, Edinburgh) had held the opinion, before he had gone over Mr. Robertson's station at Greenock, that destructor plants were something to be carefully avoided; but his visit had certainly altered his opinion of such plants, at least, so far as the presence of dust and offensive fumes was concerned. He thought that thermal storage would be a valuable adjunct to destructor plants if the amount of steam which could be generated was in excess of the amount required per day. He thought that if a good combined coal and refuse grate could be devised it would be of great advantage owing to the reduction in capital cost. He argued with Mr. Lackie that if the total amount of power available from refuse destruction was small in proportion to the total load, as in Glasgow, it was wiser to do without it altogether.

Mr. Sam. Mavor (Messrs. Mavor & Coulson) also agreed with Mr. Lackie that it was only in the smaller places where carting troubles were less marked than in large cities, that the combined station had any chance of success. He wished to know why chain grate stokers were not used—he thought they would be just the thing.

Mr. W. McWhirter (Messrs. William McWhirter & Son, Glasgow) also spoke. Mr. R. H. Willis (British Electric Plant

Digitized by Google

Co., Alloa) thought that induced draught would be preferable to forced draught, and Mr. W. H. Evans asked whether any attempt had been made to improve the calorific value of the fuel by sorting out tin cans, green stuff, &c.

Mr. Robertson, in his reply, expressed the view that it would only be a question of time for the majority of municipal stations to adopt combined destructor and electricity works. He did not agree with Mr. Lackie's views regarding the bad economy of a number of small stations, and asked wherein lay the difference in "small" towns, such as Greenock, and large towns, such as Glasgow. He found that Glasgow sold 44 units per annum per capita, and that Greenock sold 45 units per annum per capita. Therefore, why could not Glasgow generate one-third of its total load also from the refuse gathered within her borders? With regard to the adoption of chain grates, the material often tended to clog the grate and mechanism, and it was difficult to close in a chain grate properly so as to only get the draught through the bed of material undergoing combustion. He quite agreed with Professor Baily as to the need for a special type of boiler. The capital cost mentioned included boilers, and share of economiser, and piping. It must not be overlooked that to burn refuse thoroughly, and inoffensively, one must employ very high temperatures, and as the flues and chimneys could not be made to stand the high temperatures satisfactorily, it would appear that a steam boiler was about as cheap a method of cooling the gases as any which could be adopted. With regard to the cost of disposing of refuse previous to the use of the destructor, the figures were 1s. 3½d. per ton for last year, when tipping on a heap two miles from Greenock, and 1s. 8¾d. for this year, when using the destructor. Against that there must be taken into account the considerable saving accruing to the sanitary department due to the centralisation of the carting system, &c. In reply to Mr. Evans, no attempt was made to separate out good from bad refuse. Forced draught had been found to work satisfactorily so far for penetration of thick beds of fuel, but he thought that a combination of forced and induced draught systems could be used with advantage, and he has in view a present an arrangement on these lines, designed to promote better combustion by reducing the pressure over the top of the fire, by the introduction of an induced draught from between the chimney and furnaces.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

In *Stahl und Eisen* of February 24th, there was an interesting article by Remo Catani, which is abstracted in the April number of *Electrochemical and Metallurgical Industry*, upon the "Reduction of Iron Ore in the Electric Furnace."

In the blast furnace it is theoretically possible to obtain the following temperatures:—(1) With a moist cold blast 1350° C.; (2) with a dry cold blast, 1650° C.; (3) with a moist blast heated to 700° C., 1900° C.; and (4) with a dry hot blast, 2200° C. In the electric furnace, however, very much higher temperatures are produced with ease. The daily output of an electric furnace is low as compared with the output of the blast furnace, but the matter is different if the relative energy consumption is considered. According to J. W. Richards, the reduction of 1 metric ton of pig iron requires 112 kw. days, *i.e.*, 1 h.p. day yields 6·5 kg. of pig iron. The production of 8 kg. of pig iron per h.p. day in the electric furnace must be considered good, although Héroult considers that with a 10,000 h.p. plant he can get 12 kg. per h.p. day. An electric furnace plant of the same capacity as a 200-ton blast furnace would require 25,000 h.p.

In the blast-furnace the reduction is primarily by means of carbon monoxide, but in the electric furnace the reduction is with the solid carbon. Calculations are given showing the relative efficiency of the two processes. The blast furnace requires 700 kg. more of coke for the reduction than the electric furnace in order to produce 1,000 kg. of pig iron. But the electric furnace requires electrical energy for heating the charge (which, of course, is not required in the blast furnace). Also the surplus gas power available from the waste gases from the electric furnace is less than that available from the blast furnace. The difference of h.p. which may be generated by using the gas for gas-engine purposes, is between 400 and 700 h.p. Catani finally gives the following balance sheet of materials involved in the production of 1,000 kg. of pig iron from the ore.

Raw materials.	Blast furnace.	Electric furnace.
Ore	1,920 kg.	1,920 kg.
Blast	4,997 ,,	—
Lime	500 ,,	395 ,,
Coke	1,113 ,,	335 ,,
Electrodes	—	20 ,,
Totals	8,530 kg.	2,670 kg.

Products.	Blast furnace.	Electric furnace.
Pig iron	1,000 kg.	1,000 kg.
Slag	745 ,,	606·5 kg.
Gas	6,799 ,,	1,063·5 ,,
Totals	8,544 kg.	2,670 kg.
Calorific value of gas	4,121,000 Cal.	1,333,000 Cal.

There is also an interesting article by J. E. Carcano in the April number of *Electrochemical and Metallurgical Industry* on the "Production of Pig Iron at the Electric Furnace and the Industrial Utilisation of Pyrite Residue." In Italy there are enormous dump heaps of spent pyrites, refuse from the sulphuric acid works. This refuse contains about 2 per cent. of sulphur, and could not very well be worked up by ordinary blast-furnace methods. In other countries it is frequently worked up by suitable admixture with other iron ores, but in Italy such ores do not exist. Carcano has therefore experimented with this refuse in the electric furnace. The Società Unione Italiana Concimi have financed the experimental work, and a 400-h.p. plant has been used. The locality where the experiments were carried out was in Lombardy, where electricity cost 0·009 franc per kw.-hour. Coke, on the other hand, was expensive, but the experiments showed that coke dust and coal dust, which cost from 12 to 20 francs per ton could be employed. Two classes of furnace were experimented with:—(1) A furnace with two groups of electrodes, connected in series with a carbon hearth and a magnesia lining, with free escape of gas and flame; and (2) an arc furnace with a vaulted roof, of a special material, very low and entirely closed, so that the gases might be completely recovered. For general experimental work the first type of furnace was easier to use. But for permanent work the second type was much more economical. The chief advantages were smaller waste of the electrodes and the recovery of evolved gases. The chief difficulty was to find a suitable flux for material so rich in sulphur.

It was found that the balance was in favour of the electric furnace. But this is not the only point, as pig iron of an exceptionally good quality was obtained, and this *without any preliminary treatment of the raw material*. If the pyrite ash was to be used with the ordinary blast furnace a very special previous treatment was required, costing about 6 francs per ton of pig iron produced. Finally the author states that:—(1) It is possible to use directly in the electric furnace impure ores which cannot be used in the blast furnace. (2) Coals of various kinds which cannot be employed in the blast furnace can be used in the electric furnace. (3) Castings can easily be made directly from the electric furnace. It is also an easy matter to rapidly convert on the spot pig iron generated from a first furnace into special electric steel in a second electric refining furnace: and (4) In the electric furnace it is quite simple to directly incorporate with the pig iron, silicon, manganese, and other elements which appreciate its value, and also to remove those elements which diminish the value.

Signalling in High-tension Transmission Systems.—In place of the usual telephonic communication between the central station and sub-stations of a power transmission system, it has been proposed to signal on the Morse system, using the high-tension line as the conductor. A successful installation on this principle is now working on the line from Valenciennes to Blanc-Misseron, a three-phase 5,000 volt line some 15 km. long. An oscillatory circuit, the spark-gap of which is connected to an induction coil fed from the low-tension supply, is connected inductively to one high-pressure conductor by means of a coil connected between the conductor and earth. The Morse signals are transmitted by means of a key in the primary circuit of the induction coil. At the receiving station the oscillations which are induced in the high-tension conductor go to earth through another coil inductively coupled to a relay, which operates a receiving apparatus. Condensers are inserted between the coils and the high tension conductor to prevent the low frequency current from reaching the receiving apparatus or going to earth.

Abandonment of the Single-phase System on an American Railway System.—It is stated in the *Electrical Review* (New York) that a decision has been arrived at to abandon the use of equipments adapted for operation on both continuous and alternating current on the outlying lines of the Milwaukee Light, Heat and Traction Co. At an interview, the president of the company said that the amount of business on these lines did not justify the maintenance of sub-stations at frequent intervals requiring constant attendance. The alternating-current, direct-current equipment worked fairly well when operating as single units, but during seasons of heavy traffic they were compelled to attach from one to three large trailers which the alternating-current, direct-current, single-phase apparatus had not the power of starting. They were substituting for the alternating-current, direct-current equipment the 1,200-volt D.C. system, which reduced very considerably the objectionable feature of sub-stations at such frequent intervals.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 15th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

12,390/08. **Elimination of Higher Harmonics from the E.M.F. Wave Forms of Alternators.** Siemens Bros. Dynamo Works, Ltd., and M. Kloss. The armature slots produce ripples in the E.M.F. wave form on account of the fluctuation of the magnetic flux when the edges of the poles pass the teeth. These ripples may result in trouble on account of resonance, and may be the cause of considerable losses in the circuit. One way of eliminating these harmonics is to slightly shift the poles so that the ripples induced by the north poles neutralise those induced by the south poles, but this requires very careful erection. According to this invention, the armature is provided with a number of slots greater or less than those actually required, and the winding is inserted so that a small phase displacement is produced between consecutive coils which belong to the same phase. By this means the vectorial sum of the higher harmonics can be arranged to amount to practically zero. Six claims, three figures.

18,832/08. **Arc Lamp Economisers.** H. Liske and A. Zöller. Economisers for arc lamps, which are usually constructed of fire-clay, are liable to fracture owing to the internal stresses set up by the heat from the arc when the latter approaches close to the economiser. According to the present invention, these stresses are relieved by splitting the economiser at one or more places from or near its periphery to the apertures for the carbons, and slots are also provided in the walls of the economiser to allow the products of combustion to escape. The economiser is preferably split in a plane at right angles to the plane of the carbons, and, if it is split into two or more separate parts, the edges are provided with projections to ensure a passage way between the parts. Seven claims, fourteen figures.

26,555/08. **Transformer for Vapour Lamps and Rectifiers.** F. Conrad. In this transformer, magnetic material is inserted between adjacent coils in such a manner that the leakage paths thus formed for the primary flux are of greater reluctance than the leakage paths for the secondary flux. By this means the current through the lamp or rectifier in the secondary circuit is smoothed out and sustained without the aid of an inductive resistance in the rectified current circuit. The drop of potential caused by the leakage paths also results in an automatic regulation of the vapour device. One claim, two figures.

28,192/08. **Starting Three-phase Induction Motors.** Allgemeine Elektricitäts-Ges. This is a method of raising, in steps, the potential at the terminals of an induction motor on starting, without interrupting the current or demagnetising the motor. The neutral connection of the auto-transformer is first opened, and the motor is connected to points about halfway along the three windings. A pressure of one-eighth the full line potential is impressed on the motor, and it is magnetised. On closing the neutral connections of the transformer, the pressure rises to about one-half the normal, and the motor starts up taking about 200 per cent. of the normal line current: the neutral connections are then opened again, on which the motor speeds up further. Finally the transformer windings are short-circuited, and the motor is running in its normal condition. One claim, four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Davy, 8,308/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: British Thomson-Houston Co., and Dawson [Power transmission systems] 11,344/08; W. T. Henley's Telegraph Works Co. and Bishop [Cable suspension devices] 13,654/08; Westcott and Gartside [Cable coupling] 28,102/08.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [A.C. commutator motors] 6,959/08; Crocker [Automatic regulation of rotary converters] 10,796/08; Ingleby [Squirrel-cage rotors] 13,719/08.

Electrometallurgy and Electrochemistry: Cornelius [Furnaces] 10,378/08; Perry (*Co. Bismarkhutte*) [Refining of steel] 14,926/08; Gibbs [Electrodeposition] 5,958/09, 5,959/09, 5,960/09, 5,961/09, and 5,962/09.

Ignition, Electric: Wardell [Magneto-generator] 4,339/08; Heinrichdorff [Carriage gas lamps] 11,586/08; Varley [Explosion engines] 19,849/08.

Incandescent Lamps: Stearn, Topham, Handcock, and Dykes [Lamps] 4,922/08.

Instruments and Meters: Evershed & Vignoles, Ltd., and Evershed [Moving coil meters] 7,398/08; Isaria-Zahler-Werke-Ges. [Meters] 12,250/08; Roos [Circuit tester] 18,359/08.

Storage Batteries: Fennell and Perry, 6,973/08; Boult (*Allgemeine Akkumulatoren-Fabrik*) [Cylindrical positive electrodes] 17,750/08.

Switchgear, Fuses, and Fittings: Hope [Starters for three-phase motors] 4,597/08; Rorke and Rorke [Switches] 7,409/08; McNally [Switches] 8,748/08; Collis, Exley, and Leitner [Railway carriage lamp fittings] 10,712/08; Murray [Fusible cut-outs] 24,702/08; Siemens Bros. Dynamo Works (*Siemens-Schuckertwerke-Ges.*) [Potential regulators and speed controlling devices] 21,913/08.

Telephony and Telegraphy: Semat [Reproduction of pictures at a distance] 4,562/08; Schiessler [Alternative wireless telegraphy and telephony] 7,028/08; Aitken [Telephone transmitters] 15,615/08; Soar [Telephone transmitter] 17,475/08; Schiessler [Wireless telephony] 4,026/09, and 4,027/09.

Traction: Saunders, Davis, and Griffiths [Signalling] 5,705/08, 4,680/09, 4,681/09, and 4,682/09; Wood [Signalling] 11,986/08; Boult (*Union Switch and Signal Co.*) [Controlling speed of trains] 12,177/08.

Miscellaneous: Oertly and Dudley [Electrically-heated tools] 7,507/08; Major, Stevens, and Stevens [Automatic lifts] 9,195/08; Kotyra [Electromagnets] 9,291/08; Sir W. G. Armstrong, Whitworth, & Co., and Wright [Capstans] 15,571/08; British Thomson-Houston Co., and Martin [Magnetic testing apparatus] 15,941/08; Peaucellier [Contact making device] 3,621/09; Hackett [Combined tramway and telegraph pole] 6,054/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Anders [Electric clocks] 10,627/08; Coiseur [Cooking and heating apparatus] 22,551/08; Fessenden [Transmission of energy without wires] 63/09; Cumont and Compagnie de Signaux Electriques pour Chemins de Fer [Signalling] 5,565/09; Compagnie Générale d'Electrochimie de Bozel [silicides] 5,799/09; Kallmann [A.C. motor starters] 6,957/09; Akt.-Ges. Brown, Boveri, et Cie. [Cooling of enclosed machines] 7,203/09; Jaburg [Arc lamps] 7,471/09.

Expiring and Expired Patents

The following Patents expire during the current week after a life of fourteen years:—

8,385 of April 27th, 1895. **Dynamo Brushes.** A. B. Soar and E. W. Collier. Copper brushes are made up of a number of layers of corrugated wire fabric consolidated by pressure. They may be strengthened by cross rivets and by longitudinal stitching.

8,392, 8,393, and 8,394 of April 27th, 1895. **Train Lighting.** M. Moskowitz, L. D., and A. S. Adler, and W. T. Myers. The first patent relates to a system of train lighting, in which a shunt-wound dynamo is geared direct to the axle of the car. A regulating resistance in the shunt circuit is controlled by a reversible motor, which is operated through a relay controlled by a voltmeter. The lamps are supplied from a battery of accumulators, which are charged by the dynamo when the speed reaches a certain value. A machine with two armatures in series and with differentially wound field-magnets, for giving constant potential with varying speed is claimed in the second patent. The third is for a dynamo for the same purpose, in which the field-magnets are separately excited from a small differentially wound dynamo.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: B. J. B. Mills (*Boulade*) [Hand regulated projection lamp] 29,843/96.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: W. P. Thompson (*F. Davis*) [Laying cables on the solid system] 26,524/01; W. Oates [Cable conduits with draining channels] 28,731/02.

Dynamos, Motors, and Transformers: H. C. Leake [Prevention of hunting of paralleled alternators] 23,790/00; G. E. Gaiffe [Protection of high-potential transformers] 28,580/03.

Ignition, Electric: W. Best [Igniter for miners' lamps] 26,517/01.

Storage Batteries: H. H. Lake (*C. H. Clare*) [Porous plate electrodes] 28,783/02.

Switchgear, Fuses, and Fittings: British Thomson-Houston Co. (*E. M. Howlett*) [Overload circuit-breaker] 26,691/01.

Traction: British Thomson-Houston Co. (*W. B. Potter*) [Multiple-unit control] 25,749/99; T. H. Jones [Electric signalling] 26,744/01; H. F. Hill [Earthing and supporting broken trolley wires] 28,952/02.

A NEW PRIMARY CELL

A NEW primary cell, which is a modification of the well-known Lalande cell, has just been put on the British market by Messrs. Siemens Brothers & Co., Ltd., of Caxton House, Westminster. It is manufactured at their Woolwich works, and goes under the name of the "Neotherm" cell. As in the Lalande cell, depolarisation is secured by the conversion of copper oxide into red spongy copper, but the present cell has the important advantage that the depolarising material can be used again and again, as, as soon as all the oxide is converted, it is re-oxidised by heating the cell in an oven. The expense of renewing the oxide after each discharge of the battery is thus avoided, the only portions which require renewal being the zinc positive plate and the caustic soda solution.

A sketch of a section through the cell is given in Fig. 1, and Fig. 2 represents the external appearance. The cell consists of a cast-iron containing vessel, to the interior surfaces of which the copper oxide is affixed by a special patented process. It is said that the regenerative heating process can be repeated an indefinite number of times without fear of the material becoming detached from the cell. We are informed that cells are in use that have been successfully regenerated about 200 times. The positive element is an amalgamated zinc plate about ¼ in. thick, which is supported from the cast-iron cover as shown in Fig. 1, by a brass stem which passes through an ebonite bush insulating the plate and terminal from the case

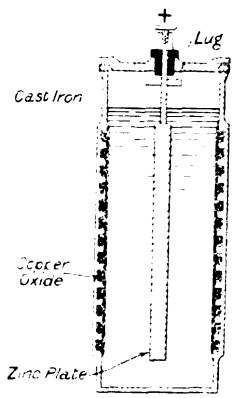

Fig. 1.—Section through Cell.

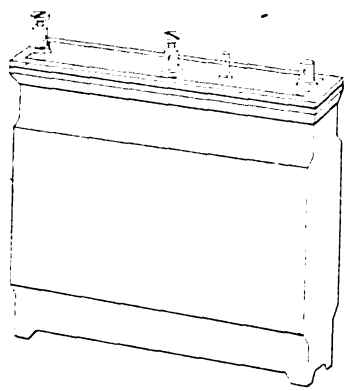

Fig. 2.—Outside View of Cell.

which forms the negative element. The enamelled cover is screwed down to the top of the vessel by two thumb-screws, either of which can form the negative terminal; these screws pass into lugs cast on to the sides of the vessel, as shown in the figure. An indiarubber gland is inserted between the cover and the edge of the vessel. The zinc plate lasts several regenerations of the copper oxide, being consumed at the rate of somewhat less than ¼ lb. per 100 ampere-hours, and the local action is inappreciable. When the oxide has been converted, the solution is emptied out, and the case only is heated in a dry condition until the material is re-oxidised.

At present the cell is manufactured in one size only, and has the following dimensions:—Length, $8\frac{3}{16}$ in.; width, $2\frac{3}{16}$ in.; height (overall), $8\frac{1}{2}$ in. The weight, charged, is 12 lbs., and the capacity is 150 ampere-hours at 1 ampere, or 100 ampere-hours at 2½ amperes. The E.M.F. of the cell when fresh is from 1·0 to 1·1 volts, but this falls rapidly to about 0·75 volts when a current of 1 ampere is taken, at which value it remains constant until the depolariser is completely converted. The internal resistance of the cell under working conditions is 0·04 ohm. The initial price of the cell is somewhat high, namely 17s., but the only portions which have to be renewed, *i.e.*, the zinc plate and the solution of sodic hydrate, are cheap.

The makers claim that these cells form an excellent substitute for small accumulators, as they do not depend on outside sources of current for recharging and do not run down when standing idle, and that they are admirably suited for charging small accumulators for motor-car ignition, portable lamps, &c. The rate of discharge is regular to the point of exhaustion. Large currents may be drawn from the cells, and they may be short-circuited without fear of permanent injury.

Death due to Defective Hand-lamp.—An inquest was held on Monday on the body of A. Rawlins, a french-polisher of Stratford, who was killed by an electric shock obtained from a defective hand-lamp. The pressure of the circuit was only 250 volts, and evidence was given to the effect that the deceased was perfectly healthy. It was stated that the lamp was of the pattern condemned by the Home Office.

ELECTRICAL NOTES FROM CEYLON

(By Our Correspondent at Colombo.)

Metal Filament Lamps "Almost Unknown." Progress in Telephony.

THE electric light and tramway system of Colombo seems to grow but slowly. Some small extensions have recently taken place at the power station, modern British machinery replacing older machinery of American manufacture. The electric lighting scheme for Newera-Eliya is making headway, the arrangement apparently being that the Government will construct the installation and then lease it to the local board. It is to be hoped that with the opening of this installation the public of Ceylon will awaken to the existence of such things as modern high-efficiency lamps. In Colombo, with energy at 8d. per unit, they appear to be almost unknown.

* * *

During the past year the principal activity in matters electrical has been confined almost entirely to the Government Telegraph Department. The main line of telegraphs for the first fifty miles from Colombo was reconstructed on substantial modern lines, it being noteworthy that the poles used were manufactured locally from old 72-lb. railway rails. The Colombo telephone system also continued a healthy growth, the extensions of outlying lines being carried out with poles constructed from old tramway rails. During the present year further portions of the main route up-country are being reconstructed in such fashion as to be ready for the erection of the telephone trunk-lines in 1910. It is also believed that the central portions of the Colombo overhead telephone system will be placed underground this year or early next year. Two new telephone exchanges are being opened up in the hill capital of Kandy and in the sanatorium of Newera-Eliya respectively. There is also considerable activity among the planters, who are opening up numerous local telephone exchanges, each of which will serve a group of estates. For this purpose Government is assisting by supplying the planters with telephone materials at favourable rates. A large new building is in course of construction for the Government Telegraph Department in Colombo, and when completed will form the headquarters of the Telegraph and Telephone Departments.

* * *

It is rumoured that Government will shortly instal a wireless telegraph service between Colombo and the Island of Minicoy, a distance of 420 miles. The principal object of this is to enable all steamers bound for Colombo to signal their approach some days prior to arrival.

Electric Traction in Chile.—A Chilian company has obtained concessions for the utilisation of the water-power of the Curanilahue river, in the province of Arauco, for supplying power for the railway between Curanilahue and Yani, which is to be converted to electric traction.

Proposed New Cable to Argentina.—According to the *Morning Advertiser*, a Buenos Aires telegram states that the Western Telegraph Co. has proposed to the Argentina Government the construction of a new cable uniting directly Argentina and Europe, and touching at Ascension Island. The scheme is said to have been very favourably received.

Iron and Steel Institute.—The annual meeting of the Iron and Steel Institute will be held in London on May 13th and 14th next, at the Institution of Civil Engineers, 25 Great George Street, Westminster. Owing to the unavoidable pressure of engagements, the President-elect, Sir W. Thomas Lewis, may not be able to be present on this, the occasion of his accession to the office of President, and Sir Hugh Bell will occupy the chair. The meetings will commence at 10.30 a.m. The annual dinner will be held in the Grand Hall of the Hotel Cecil on Friday, May 14th, at 7 p.m. Among the papers to be read are the following:—"The Production of Iron Sheet and Tubes in One Operation," by S. Cowper-Coles; "The Preservation of Iron and Steel," by A. S. Cushman; "The Manufacture of Peat Fuel," by Dr. E. M. Ekenberg, M.A.; "The Bristol Recording Pyrometer," by P. Longmuir and T. Swindon; "The Roechling-Rodenhauser Electric Furnace," by W. Rodenhauser; "Further Experiments on the Ageing of Mild Steel," by C. E. Stromeyer; "The Rusting of Iron and Modern Methods of its Prevention," by Professor W. Walker. The autumn meeting of the Institute will be held in London on Tuesday, Wednesday, and Thursday, September 28th, 29th, and 30th at the Institution of Civil Engineers, 25 Great George Street, Westminster. A Committee is being formed to carry out the necessary arrangements.

THE AERO FIRE ALARM SYSTEM

New Central Call Office in London

We have already had occasion to refer briefly to the principle of the Aero fire alarm system, which depends for its action on the expansion of the air in a tube running through the building to be protected, and we are now enabled to publish a complete description of the system and of the central call station which has been installed at 92 Queen Victoria Street, E.C., adjacent to the L.C.C. Fire Station. Although the actual working of the system may concern only a small number of our readers, it is well worth a little careful study on account of the ingenious methods which have been devised for rendering the system absolutely reliable under all possible conditions of working.

The system, which is protected by a large number of patents, may be divided into four parts; first, the sensitive mechanical alarm apparatus; secondly, the local electrical circuit in the protected building, controlled by the alarm apparatus; thirdly, the main alarm cable circuit controlled by apparatus in the local circuit; and lastly, the indicating apparatus in the central alarm station. The alarm apparatus comprises a copper tube, one-tenth of an inch in outside diameter, which is run round the ceiling of the rooms of the building to be protected. The tubing can be fixed with staples or hooks

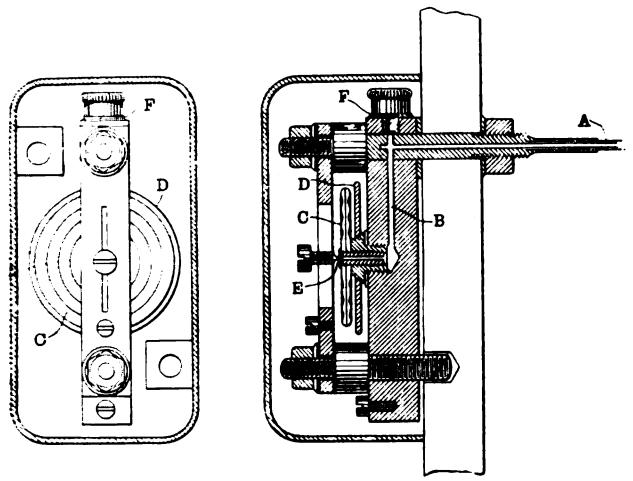

Fig. 1.—Section and Plan of Detector.

just above or below, or even behind moulding, and is not in the slightest degree unsightly. It is solid-drawn, and needs no protection, but in the case of public buildings, warehouses, &c., it is enclosed in a spiral steel wire armouring to comply with the rules of the Fire Offices Committee. A separate tube is provided for each floor, but in the case of very large buildings there may be several tubes per floor. Both ends of each tube go to the indicator board, where one is joined to the "detector," and the other to a valve. There is a separate detector for each tube, but as many as ten tubes may go to a single valve, which is only for testing purposes.

A plan and section of a detector is given in Fig. 1. This consists essentially of a closed flexible chamber *C*, similar to that of an aneroid barometer, fixed, for the purposes of handling, to a brass disc *D*. The expansion of this chamber causes a contact to be made at *E* between one platinum point on the chamber and another on the end of a screw supported by a brass bar insulated from the rest of the detector. The copper tube is led into the detector as shown at *A*, and communicates with the air chamber through the vertical passage *B*. At the top of this passage there is a milled nut, which screws down on to a porous washer *F*, which may be of any suitable material. The function of this washer, which acts as a variable "leak," is to prevent slow changes in the temperature of the building from affecting the apparatus. If, for any reason, the air in the neighbourhood of tube is gradually heated, the air in the tube expands, but this does not cause an alarm to be given, as the pressure is relieved by the continuous leak through the porous washer. Should the temperature rise suddenly, as in the event of a fire occurring, the expansion of the air is too rapid for the leak to prevent the bulging of the air chamber, and an alarm is given. The amount of leak, and the distance between the contacts, are varied to suit the conditions likely to prevail; the amount of leak fixes the rate of heating which shall cause an alarm, and thus acts as a time element device, and the distance between the contacts is determined by the rise in temperature which shall take place before an alarm is given. If sudden but only temporary rises of temperature are to be expected, as in the case of a baker's shop when the oven doors are opened, the leak is set tight, but the contacts wide apart. If wide but more gradual fluctuations of temperature are expected, the leak would be set loose but the contacts close.

An outline diagram of the two electrical circuits is given in Fig. 2. The local circuit in the protected building comprises a battery of accumulators (or primary cells for closed circuit working), with a terminal pressure of from 8 to 10 volts, in series with an electromagnet *K*, of some 300 to 1,000 ohms resist-

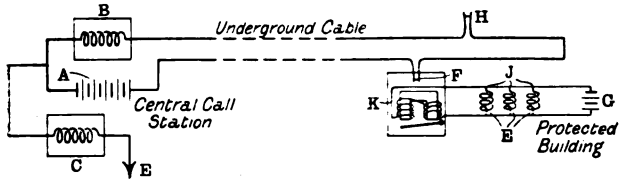

Fig. 2.—Outline Diagram of Connections.

ance. The detector contacts are placed as shown at *E*, in parallel across the battery, and if any one contact is closed, the electromagnet *K* is short-circuited. Indicators *J*, of from two to five ohms resistance each, are connected in series with the contacts so as to indicate which detector has operated. In the event of a fire, one of the contacts *E* is closed, and the armature of the electromagnet *K* releases a clock mechanism. This causes the main circuit, which is shown looped into the building at *F*, to be intermittently and alternatively earthed and broken with definite time intervals between each operation, so as to transmit a code signal to the central station. The main circuit comprises the underground cable closed ring connection, and a 24-volt battery *A* at the central station, and a Morse "register" *B*, for indicating and recording breaks in the circuit in series and also at the central station. The circuit is earthed at the station through another register *C*, for indicating and recording the earth signals. Ordinary drop indicators, one for each circuit, are also provided on the board in the central station at Queen Victoria Street, to which all the London circuits will be brought. The main circuit is shown looped into another building at *H*; as many as ten separate installations may be connected in series, in this way, on a single ring main. The number is limited to ten by the Fire Offices Committee Rules.

Although the diagram of Fig. 2 serves to explain the principle of the system, it must not be taken to represent the actual connections. Thus, in reality, the registers are not connected in series with the main cir-

Digitized by Google

cuit as shown, but are actuated through the medium of relays which, together with their attendant switches, are not shown in the diagram.

When the alarm apparatus causes the circuit to be earthed, say, at F, the register C records a signal, and when the circuit is broken at F, the register B records a signal. The transmitter itself, whose operation is controlled by the electromagnet K, is illustrated in Fig. 3. Its operation is as follows:—

When the electromagnet K is short-circuited, the armature M is allowed to fall; this releases a detent, and permits the clockwork to run. Fixed to one of the wheels is a toothed wheel N, most of the teeth of which have been cut away. As this wheel rotates, it first earths the main circuit by touching the spring S which keeps the contacts F together (the same contacts as those denoted by F in Fig. 2), and then separates them by lifting the spring S breaking the circuit for an instant.

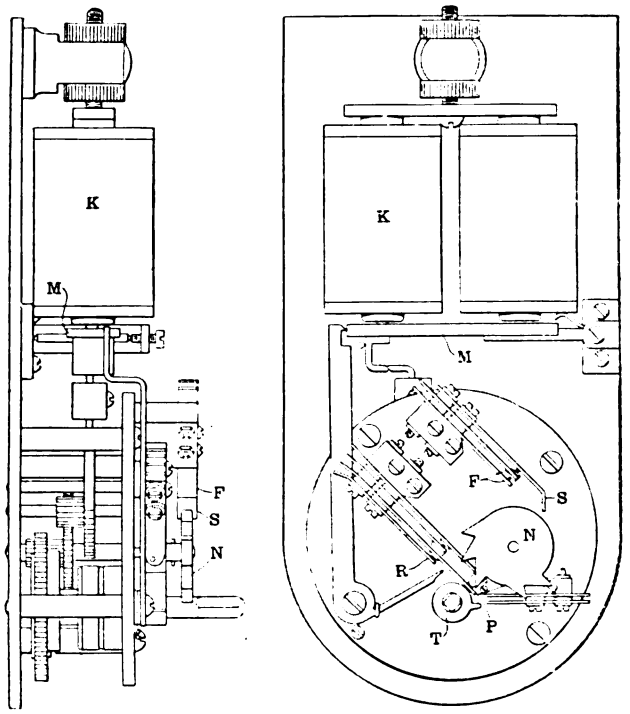

Fig. 3.—Side and Front Views of Transmitter.

Each tooth as it comes round repeats this operation, and by providing each transmitter in the circuit with a differently cut toothed wheel, a different signal is obtained from each building. The wheel rotates five times, thus transmitting five successive code signals, and at the end of the last rotation, another wheel T, which has revolved once only, makes contact at P, and this rings a large fire gong attached to the outside of the building.

On receiving the signals at the central station the operator in charge immediately informs the nearest fire station.

To avoid a false alarm due to the breaking of a wire in the local circuit the following device is employed:—

A second circuit to the electromagnet is provided by means of a cam and a set of contacts R, which come into operation after the first rotation of the toothed wheel. If the armature is then lifted (which means that none of the detector contacts are touching) the clockwork is stopped. Only one code signal is transmitted in this case, and this is termed a "trouble call." In the event of a fire occurring before the fault in the local circuit is repaired, the remaining four code signals will be delivered.

A complete diagram showing the whole of the local circuit for a five-floor building with one copper tube per floor is given in Fig. 4. The lettering on this diagram corresponds with that on the simplified diagram of Fig. 2, and the drawings of Figs. 1 and 3.

The main circuit is shown looped in to the terminals 8 and 9, to which the contact springs F are connected. It will be noticed that the wheel N is earthed through terminal 10; that the fire-gong circuit is completed when contact is made at P; and that on the completion of the first rotation of the wheel N and the throwing out of the switch R, a different circuit to the electromagnet K is provided so as to avoid a false alarm due to a break in the first circuit.

The whole of the local circuit and all the apparatus with the exception of the fire-gong are enclosed in a cupboard under lock and key. Every day, however, the system must be tested by the owners of the building, and the Aero Co.'s official calls to make a test

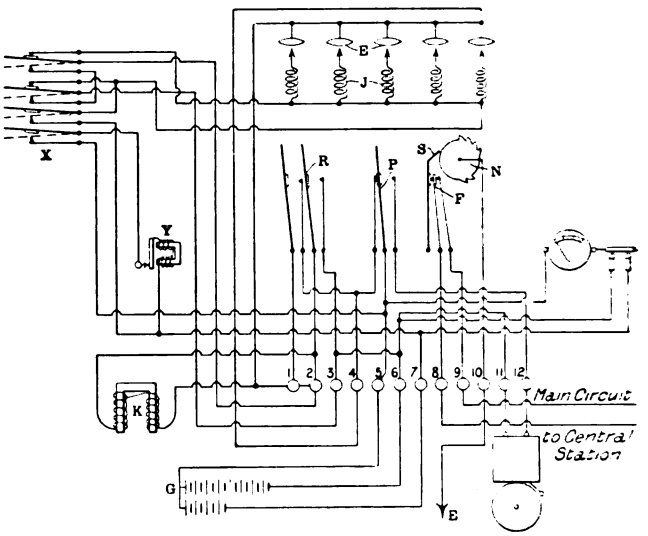

Fig. 4.—Complete Diagram of Connections of Local Circuit.

once a month. When the cupboard is opened, the door switch X is thrown into the position shown dotted. This immediately disconnects the detectors from the electromagnet K, and thus prevents them from operating the transmitter. The detectors are left connected to a battery, however, so that a test can be made. Opening the door also connects up the trembler Y,

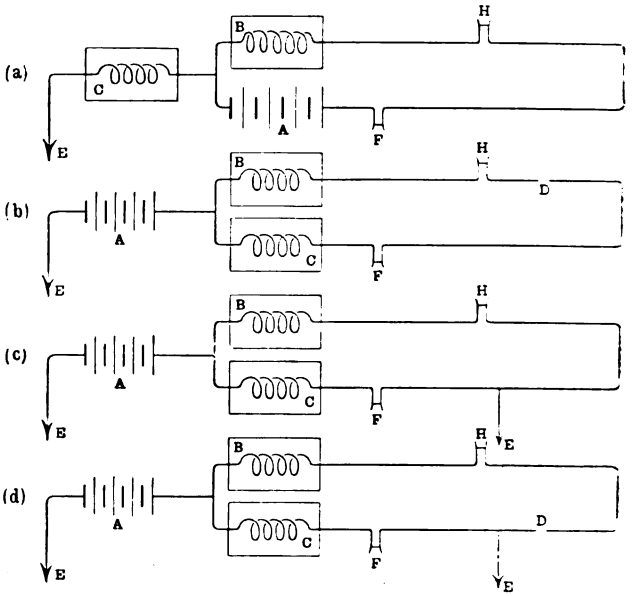

Fig. 5.—Diagrams showing Connections of Main Alarm Circuit under different Conditions.

(a) Normal condition.
(b) Broken Circuit.
(c) Earthed Circuit.
(d) Broken Circuit and Earth.

which does not cease buzzing until the cupboard is closed again.

To make the test, a small quantity of air is pumped into the tubes after opening the valve at which they terminate. The pump comprises a cylinder and a piston only, and a single stroke suffices to create enough pressure in the tubes to bulge all the air chambers and close the contacts. The drop indicators then fall, but nothing further happens. On drawing the pump piston back, the pressure in the tubes is restored to its original value; the flaps of the indicators are then replaced, the valve closed, and the door of the cupboard

Digitized by Google

shut. Should the valve be forgotten, it is closed automatically when the door shuts. In the case of a large installation there may be several valves, into each of which ten or more tubes may be led, but one pump suffices for all. Each detector is enclosed in a brass box, which is secured from the back of the board, and the transmitter is also enclosed in a locked-up box. There is thus no fear of any derangement of the apparatus occurring during testing.

An interesting feature of the system is the provision made for ensuring reliable working even if an accidental break or an earth, or both, occur on the main cable circuit.

The different conditions are illustrated diagrammatically in Fig. 5, where (*a*) represents the normal condition in which register *B* indicates a break, and register *C*, an earth. Now if the circuit is accidentally broken at *D*, register *B* indicates a continuous break, and the operator immediately changes the connections to those denoted in (*b*), in which both registers act as earth indicators, one on each side of the break. Of course, the break is repaired as soon as possible, as, whereas under normal conditions both registers indicate a call from any one building, in this case the call is indicated on only one instrument. The case of an earth on the circuit is shown in (*c*); here current is flowing continuously through both instruments through the earth connection, and both indicate the "break" signals. In (*d*) there is both an earth and a break, and in this case, register *C* indicates the break signals, and register *B* the earth signals. If there were an earth on the other side of the break as well, both instruments would be connected so as to indicate break signals. Of course, the portion of the circuit between an earth and a break is isolated, but if a break and an earth occur together in practice, it is usual that the earth takes place at the break. The repair of the fault is automatically indicated at the central station, as either one or both instruments record a continuous signal. Ordinary Morse receiving instruments, which emboss, ink, or perforate the signals on a paper tape, are used, and the change over from a "break" to an "earth" indicating instrument is easily effected by means of an adjustment of the corresponding relay.

From the above it will be seen that there is little chance of the system being accidentally put out of order, or of false alarms being given. It should be mentioned that instead of rearranging the whole of the central station connections, as indicated by Fig. 5, on account of a break or an earth in one main circuit, the faulty circuit is picked out by means of a plug, and transferred to a separate set of registers which are connected to suit the particular conditions of the faulty circuit. The operation of transferring a faulty circuit takes only two or three seconds, and the remaining circuits are left in the normal condition.

The company has made arrangements to use spare wires in the underground telephone cables of the National Telephone Co. and the Post Office for connecting up its customers, and thus requires no special cables of its own. In London all buildings on the system will be connected direct to the central station, but in the provinces the indicating instruments are placed in the fire station itself, and no central call office is required. The main circuits vary in length from 400 yards to six miles or more, as in the case of a country mansion some distance away from any town. In such an installation alarm bells can be installed in various houses all over the estate, so as to bring up all the staff to assist in extinguishing the fire.

In the central call office at 92 Queen Victoria Street there are two batteries, and means are provided for changing over from one battery to the other without breaking the circuit. A charging board is also installed. Besides the two indicating instruments already mentioned, a duplicate set is always ready for use in case of a fault in the other set. At present the apparatus for 50 main circuits, or 500 buildings, is completed, but the board is large enough for 150 main circuits.

Among the installations which are complete or nearing completion are Selfridge's, Oxford Street (see Electrical Engineering of March 25th, p. 277); Allen & Hanbury, chemists, of Bethnal Green; Jas. Truscott & Son, Ltd., of Suffolk Lane; and Spiers and Pond, Ltd., of Queen Victoria Street. Two large buildings in Manchester have also been connected direct to the central fire station in that city.

THE G.B. SURFACE CONTACT SYSTEM ON THE L.C.C. TRAMWAYS

Mr. Mordey's Reports

In Electrical Engineering of April 8th (page 323), we gave a report of the debate at an all-night sitting of the London County Council, which culminated in the decision of the Council to reject the system finally, notwithstanding the favourable reports of Mr. W. M. Mordey (President of the Institution of Electrical Engineers), who was called in by the Council to investigate the causes which had led to the troubles experienced. It will be remembered that the short section of the line from Aldgate to Bow which had been equipped on the G.B. system (see Electrical Engineering, Vol. IV., page 11), was put into operation in June last, but after about a month the service was suspended on account of troubles with live studs, &c., and the investigation of how far these troubles could be avoided was put into the hands of Mr. Mordey.

We are now in a position to give the substance of Mr. Mordey's reports, which have not hitherto been made public, and, in connection with the early history of the installation, we will also quote from a letter which Mr. B. D. Bedell, engineer to the G.B. Surface-Contact Company, sent to Mr. Mordey at the time his first report was in preparation. This letter throws a good deal of light as to the share that the engineer to the G.B. Company and the officials of the London County Council had in the design of the details upon which the success or failure of the system depended.

First of all it appears that the Council did not see their way to letting the contract either direct to the G.B. Company or to the company who worked with them in installing the line at Lincoln, but eventually an arrangement was made with Messrs. Dick, Kerr & Co. for them to instal the system under a royalty of £500 per mile, which figure was not intended to include technical assistance. A certain amount of technical assistance was, however, asked for, and rendered, afterwards, and, in the case of the track, a fixed sum per mile was allowed for supplying the contractors with men who had experience with the laying of the system.

A good deal of trouble was experienced with the design of the car equipments; the County Council made alterations in the design prepared by the G.B. Company, and the company expressed their disapproval of these, and disclaimed all responsibility as to their satisfactory working. Altogether matters did not proceed as smoothly as could have been wished, even at these early stages. The company complained of the design and construction of the collector magnets for the cars, alleging that the section of the cores was not sufficient to carry the flux for the pole bars, and that the mechanical construction was such that scrap iron collected by the magnet could cause short circuits. The patentees made other complaints as to the detail of the design, and finally laid a formal complaint through their solicitor before the Council, in order to defer the Board of Trade inspection.

With regard to the track, the company also assert that the Council's design of cable access bores, which superseded their own design, was the cause of short circuits, owing to the metal-work being flush with the paving, and coming into contact with scrap iron carried by the magnet, so as to cause partial short circuit. They also attribute several gas explosions to the faulty design of the drainage sump designed by the L.C.C. officials, and they further complain that, after the service of cars was started, they were not afforded sufficient information to enable them to judge of the causes of the troubles experienced.

When the service of cars was stopped, the company still maintained that the system had not had a fair trial, and they wrote to the Clerk of the Council offering to take over the route, to put it right, and to maintain it for 12 months, if the Council would equip cars to their design to run on it, for a charge not exceeding £2,500, which was only to be paid if the result was satisfactory. This offer, however, was not accepted by the Council, and the matter was placed in the hands of Mr. Mordey.

Digitized by Google

Mr. Mordey's first report, dated October 1st, 1908, says at the outset: "In my opinion, all the defects are remediable, and the working can be made efficient and safe." He then proceeds to detail the various causes of trouble, and considers how they may be remedied.

The principal cause of trouble is leakage caused as follows:—When a car passes away from a stud the contact piece of the stud being no longer left in contact with the cable by magnetic attraction, rises, and in ordinary circumstances should switch the stud out of connection with the cable. When the roads are wet and dirty, however, a small amount of current passes from the stud under the car directly to the rails, in addition to the current that goes through the motors. When the car passes on, and the stud rises, this small leakage current may continue to pass as an arc across the air space between the contact-maker and the cable, thus keeping the stud alive by a sort of imperfect connection with the live cable.

Mr. Mordey then investigated the conditions necessary to make the studs alive, and shows that it would be impracticable to reduce the trouble by increasing the gap. The prevention of the arc by shunting the gap with a resistance is gone into, and the use of a small trailing brush connected to the skate through a suitable resistance, is proposed. An alternative method suggested is to shunt the gap with a suitable condenser. A separate condenser would be carried on each car with a suitable trailing brush placed between the rear end of the collector and the trailing brush which is now used for detecting live studs. Mr. Mordey also considered that some increase in the sensitiveness of the studs was required, but we understand that on further consideration of the subject, the alterations suggested for this purpose were not insisted on. Several minor matters are discussed in the report, and the following conclusions are given:—

A length of not less than half a mile of the track should be overhauled and the studs modified in accordance with the report. All studs should be tested to a definite standard of working, electrically and mechanically, before being put back on the track. One or two cars should be run over this length of track at night, especially under trying conditions of weather and track. Each car should be fitted with extra contact brushes, connected alternatively to a resistance shunt and to a condenser in order to try both methods. The presence of live studs should be ensured by adding to the mud on the road at a sufficient number of points to enable a thorough trial to be made. The collector should at first be used as it is now, then with two exciting coils only. The wood coverings of the collector should be made impervious to moisture by soaking in hot paraffin wax or other suitable impregnating material. The wire and hemp suspension rope should be treated in the same way.

An appendix to the report gives an account of the successful working of the G.B. system at Lincoln, and a further appendix contains some correspondence with the G.B. Co.

A contract was then entered into by which the licensors, at their own cost, were to make the necessary alterations to about half a mile of track and provide and fix equipments to such number of cars to be provided by the Council, not exceeding four, as might be necessary to enable the licensors to make further experiments at their own cost with the system under the direction and in accordance with the requirements of Mr. Mordey and to his satisfaction.

Alterations were accordingly carried out to Mr. Mordey's requirements, and he made a preliminary report, dated March 6th, on some trial runs with the altered equipment, extracts from which are given below:—

I have had a car out on the track twice. On the first occasion the condition of the track was very trying, there being a good deal of ice glazing on the studs and rails and the ordinary leakage being large, resulting partly from the tracks having been sprinkled with salt apparently shortly before the run started. Although some adjustments require to be made, I am satisfied with the result of those two trial runs. The arrangement for stopping the arcs, which are the most common cause of live studs, works well. It has been tried both with the resistance and with the condenser devices described in my report, and was apparently equally successful with either. After running several journeys with the device in use, during which the car left no live studs behind it, I disconnected the device and ran three single journeys without it, during which the car was frequently stopped by the detection of live studs. On again connecting the device the running was continued without interruption. This afforded satisfactory proof that the device was acting effectively. A speed estimated at 24 miles an hour was attained. The new collecting arrangement on the car seems to be much better than the old one. It takes less than half the energy, and gives a perceptibly stronger and more certain action of the studs.

A further report, dated March 10th, states:—

The state of the track has varied from an icy condition with freshly-scattered salt on it, to a fairly clean condition without salt, and at a temperature well above freezing. Under all these conditions the trials have been satisfactory. The arc-stopping device recommended in my report is quite effective. On disconnecting the device numerous live studs occur even in the driest state of the track that has so far obtained. . . . Subject to further trials, which I do not expect will cause any difficulty, I am satisfied with the result of the trial runs, and confidently recommend the Council to have the whole track overhauled in the same way, and the necessary cars equipped to run the full service.

The next report is dated March 23rd:—

This morning I attended a run of the car from about 12.40 a.m. to 5.40 a.m. The weather was warm and the road was in a rather wet and muddy condition. It was, however, much less muddy than I expected it to be. A very slight drizzling rain was falling. Seven double journeys were made and various short runs. With two exceptions the running was satisfactory, and the effect of the condenser was proved, as before, by running without interruption when it was on, and by the large number of live studs stoppages when it was off. The two exceptions were as follows:—In the first place, one stud was always found to be alive and difficult to extinguish, the condenser often failing to put it out. I therefore had it taken up, and found the top of the stalk was broken. The second exception was more serious. A horse received a shock from a stud and fell, cutting its knees, but sustaining no further injury. This occurred on a short piece of line which has not been used at all in these trials. It was found the stud was alive, and evidently not from an arc, but from a contact. On running the car over it once or twice it cleared itself, and then worked normally. On taking it up it was found to be in good order, and there was no indication of the cause of the fault. The G.B. Company suggest that a small drop of hardened pitch or other material had got into the fork of the stud, and caused sufficient sticking of the armature to prevent it from returning when, by the ordinary vibration of the road, it was lowered a little towards the cable, and so by a succession of small downward movements it was finally caused to make contact. I think this defect, which is one of newness, is very unlikely indeed to recur. The collection was very much better than on any of the previous trial runs, the car running almost sparklessly, even at the higher speeds. It was found possible to run well with only one collector in use.

In response, apparently, to a special request, Mr. Mordey sent in a supplementary report, dated March 31st:—

These runs have shown that comparatively little preliminary running will be required to get the line into working order. An examination of the records of those runs shows that on the last run, with the exception of the accident to a horse on a section of the line which had not been tested or run over, no defect of any kind was met with, except one stud, which was found to be broken. Two or three such broken studs have been found during the previous runs. It will be remembered that in my original report of Oct. 1st, 1908, I said that I did not consider it necessary for the purposes of this trial that cast steel should be substituted for the cast-iron stud heads, but that a small number of such steel stud heads should be tried. This has not been done, as I have not insisted on it. It was not essential for the purposes of this trial. I think, however, it would be well to use steel heads in order to avoid the occasional breakages which would otherwise occur. The arc-stopping device, as already reported, has proved to be effective. I have been informed by Mr. Trotter, of the Board of Trade, that he considers it a very satisfactory solution of the difficulty caused by arcs, and that, together with the alarm device previously fitted, it affords an adequate provision against danger to the public. Some difficulty was experienced with the collector, two stoppages being due to breakages of cast-iron links. The G.B. Company agrees with me that these links should be of steel, and are preparing a design in that material. A further difficulty with the collector was caused by the support of the chain working loose. This is a small and easily remediable mechanical defect. It led to considerable sparking on the surface of the road. When it had been put right, as it was on the occasion of the last run, the collection was admirable and sparkless.

I have already reported that a speed of probably fully 24 miles per hour was attained without difficulty. Apart from other questions this is about twice the speed which, I was informed by the Council's officials, it was possible to run with the original equipment.

The fact that in even six short runs under very trying conditions we had got the line into satisfactory working order (with the exception of one stud, which was found to have a mechanical break), shows how comparatively little preliminary running is likely to be necessary to get the whole line into satisfactory order. I was prepared from the first for a considerable longer period of trial before demonstrating this. I think it highly satisfactory, and may remind you of the long

Digitized by Google

period of three months of preliminary trial (in actual service) allowed by the Lincoln Corporation to enable the contractors to remedy small defects of construction and to eliminate the weaknesses incidental to all new work.

During the preliminary construction work a large number of the earthenware T pieces—more than 100—were found to be slightly cracked or broken, but only in one case had any dirt penetrated into the T piece. I therefore did not consider these slight defects were serious, as they had been down a long time without developing faults. In any further overhauling I should not consider it necessary to replace them.

Mr. Fell mentioned the question of the hammer blows due to horses possibly making the studs momentarily alive in the same way that they can be made alive by the blow of a hammer. This matter attracted my attention at the first, and it was only after a long series of careful experiments, made with the help of the Council's officials, that I was able to satisfy myself that no danger would arise from this cause. Until I made those tests I held the view that Mr. Fell has very naturally expressed. Fortunately also there is the 3½ years' experience at Lincoln which confirms my experiments. There, although the traffic is thin, there are plenty of fast trotting horses and heavy vehicles, and yet there has never been any case of such effect as I at first feared.

In my opinion, after a very short time, the stoppage of a car by the action of the alarm would be very infrequent indeed. This alarm seems to be quite effective, and I may remind you that this occasional effect has always been known in connection with this system, and was within your knowledge before the adoption of the system. So far as I know, no other surface-contact system has so adequately provided for giving warning of these occasional defects. Their existence does not appear to me to constitute a reasonable cause for anxiety, or to be inconsistent with due regard to the safety of the public.

We have reason to believe that a further report or letter from Mr. Mordey, dated April 5th, was submitted to the Council just before the meeting at which the abandonment of the scheme was finally decided upon, but we have not had an opportunity of seeing its contents.

AMERICAN TELEPHONE AND TELEGRAPH CO.

THE annual report of the American Telephone and Telegraph Company contains some interesting particulars with regard to the extent of the company's operations and its relations with its associated companies. The parent company is primarily a holding company, holding stocks of the associated operating and manufacturing companies, but it also owns and operates the long-distance lines which connect all the systems of the associated companies. In addition to this, it assists the associated companies, planning and building exchanges for them so that the whole system is standardised on one basis.

A recent valuation of the company's property shows that real estate constitutes 9 per cent.; underground conduits and cables, 20 per cent.; copper wires and aerial cables, 18 per cent.; pole lines (not including the wires, but including the ownership of rights of way over private property), 26 per cent.; iron wire, 4 per cent.; and central office and sub-station equipment, 23 per cent.

From an investigation of the depreciation of plant, it is stated that the cables and copper wires have shown very little depreciation, so that a definite rate has not yet been established: there is, however, a net scrap value of 40 per cent. Iron wires have a life of from eight to fifteen years, and pole lines from ten to sixteen years. The depreciation on exchange and sub-station equipment is naturally dependent on its character and the policy with regard to replacement by new apparatus.

Fifty per cent. of the exchange wires are underground, and the total value of the exchange wires is 84 per cent. copper and 16 per cent. iron. Of the long-distance wires, 91 per cent. are copper and 9 per cent. iron. There are now underground lines between New York and Philadelphia, Chicago and Milwaukee, and a substantial part of the way between New York and Boston. Some of the pole lines of the company are built for a considerable length over rights of way actually owned by the company, and acquired at a cost of £1,750,000.

The number of stations on the companies' systems at the end of last year was 3,215,245, an increase of 179,712. In addition to this there were 1,103,144 stations connected to the system by the Company's long-distance lines, but worked by companies not in the American Telephone and Telegraph Co.'s group. Adding private lines, the total of 4,364,269 stations connected to the bell system is given as compared with 3,859,000 at the end of the previous year. The total mileage of wires, including both exchange and long-distance lines, is 9,870,718, an increase of nearly 1¼ million. The daily traffic over the companies' own lines represents about 18,500,000, and there were 463,000 trunk connections. The latter show a decrease of 31,000 compared with last year, but the exchange connections an increase of 370,000.

CATALOGUES AND PAMPHLETS RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

WIRING SYSTEM.—A catalogue from the Sun Electrical Co. gives particulars of the O.S. wiring system, comprising "metacase" conductors used either by themselves or in conjunction with "Kalkos" conduits and fittings. This system was fully described in an illustrated article in Electrical Engineering, April 3rd, page 337. A further leaflet gives notice of some reduction in price of "Kalkos" tubing, and particulars of some new fittings added to the list.

PRIMARY BATTERIES.—A new list from the India Rubber, Gutta Percha, and Telegraph Works Co., Ltd., gives particulars of a number of forms of battery made by the company at their Silvertown works. Leclanché cells are listed in the ordinary porous pot and agglomerated forms, including the large six block low resistance cells for telegraph purposes. Special low resistance Leclanché batteries, with a number of ebonite cells in a teak case, are also made for blasting purposes. Other forms include Leclanché batteries made up in portable cases, with accessories for medical work and special testing cells. Other batteries listed include several forms of Daniell bichromate, Bunsen, Minotti, and Grove cells, and a special double fluid low resistance battery suitable for driving small dental and other motors charging small accumulators, &c.

FIRE ALARM SYSTEM.—A leaflet from Messrs. Marples, Leach & Co., Ltd., of Admil Building, Artillery Lane, London, E.C., describes a new electric hooter fire alarm system especially suitable for small towns and villages. Push-buttons are located in various parts of the town, and an electric hooter is installed in the fire-station. These are connected up, and a small continuous current is always flowing. On a fire alarm push being actuated, a vibratory generator is set working, and a high pressure, high frequency current is sent through the circuit. This current causes the hooter to sound until the fire station indicator, which corresponds with the district from which the call originated, is restored to its normal position. Earths or breakages in the alarm circuit are indicated at the fire-station.

RONTGEN RAY APPARATUS.—We have received from Mr. Leslie Miller, of 93 Hatton Garden, London, a booklet entitled "Röntgen Ray Wrinkles," which, according to the preface, is intended to help X-ray operators through the technical troubles and difficulties which they are certain to encounter. The function and operation of the different pieces of apparatus are clearly explained, and a large number of practical hints are scattered throughout the text. The booklet can be obtained from the above address at the price of one shilling.

WIRING ACCESSORIES.—A list from the Electrical Co., Ltd., of 121 Charing Cross Road, London, W.C., gives particulars and prices of a large selection of wiring accessories, including lamp-holders, adapters, switches, ceiling roses, and cut-outs, wall sockets and plugs, &c. Small pocket ammeters and voltmeters for both direct and alternating current, for testing incandescent lamps in position, are also included. The list is well arranged, and copiously illustrated.

OIL SWITCHES.—Particulars of various patterns of oil switches for alternating-current circuits of pressures up to 1,000 volts are given in an illustrated leaflet from the Electrical Co., Ltd., of Charing Cross Road, London, W.C. Switches for 30 and 60 amperes are fitted with handles; those for heavier currents have hand-wheels. A special interlocking arrangement, so that the case can only be opened and the fuses withdrawn when the switch is in the off position, or the switch closed only when the case is closed, can be fitted with certain patterns when required. The cases are designed for erection on iron brackets.

Speed Indicators on Tramways.—It will be remembered that in January last a circular letter was issued by the Board of Trade to the tramway authorities of the United Kingdom calling attention to the desirability of applying speed indicators to tramcars for training drivers in judging speed. In the meantime, the Tramways and Light Railways Association has been collecting information from its members on the subject, and has now addressed a letter to the Board of Trade, pointing out that in their opinion there is not at present a speed indicator on the market which will satisfy practical conditions. Wherever they have been tried this has been found to be the case, and the Association considers that it is extremely doubtful whether, considering the varying speeds and different services required in tramway practice, indicators could be made to fulfil a useful function.

Digitized by Google

LOCAL NOTES

AUSTRALIA: *Sydney: Electric Supply.*—Major Cardew, of Messrs. Preece and Cardew, is now in Sydney, to report upon the City Council's electric lighting and power system. The *Australian Mining Standard* states that Major Cardew has stated that as far as he could judge, from reports and statements which had reached him, he imagined that the system must be in a healthy condition, and certainly its growth had been almost double what he had anticipated.

BACUP: *Tramways.*—The work of reconstructing the tramways for electric traction has been commenced.

BARKING: *Lighting and Tramways Undertaking.*—According to the annual statement of the Chairman of the Council the electric lighting undertaking during the year made steady progress, as shown by the fact that 1,337,344 units had been sold, an increase of 269,906, or 25 per cent. The number of units used for traction was 328,910, an increase of 20,063. He anticipated that the department would this year prove self-supporting. The number of passengers carried by the tramways during the twelve months was 1,280,420, as compared with 946,890 in the previous twelve months. The receipts amounted to £3.130, as against £2,660. Notwithstanding the increase, the financial result of the working was far from satisfactory.

BARNES: *Electric Supply Charges.*—The Electrical Engineer is to prepare a report showing the loss of revenue to be expected if the charges for private and public lighting were reduced by 25 per cent., and charges for power 12½ per cent. from October next.

BIRKENHEAD: *Tramway Accounts.*—In presenting the annual estimates to the Corporation on Monday, the Chairman of the Finance Committee stated that the tramways undertaking was not in a flourishing state financially, for instead of the estimated profit for the year 1908-9, there was an adverse balance of £900. The estimates for the coming year showed a profit of £585, and he hoped this estimate would be realised. He uttered a word of warning with regard to the tramways reserve account. In March, 1908, this stood at £9,623, or only 2·68 per cent. of the total capital outlay, and he doubted whether it was not advisable to charge an amount to the rates on account of this fund, in order to adequately provide for depreciation.

BOURNEMOUTH: *Tramcar Accident.*—On Wednesday last week, a collision took place between a Corporation tramcar and a railway van, close to the scene of the accident which took place in May last year, and which was the result of the re-organisation of the tramways department. The driver of the car states that when proceeding down Poole Hill, the magnetic brake would not act, but that had the track been clear, no accident would have occurred. As it was, the railway van referred to was unable to get clear of the lines in time, and was wrecked in the collision which took place. Mr. Bulfin, the Electrical Engineer to the tramways undertaking, however, stated that when he examined the equipment after the accident, the magnetic brake was in proper working order.

BURSLEM: *Electricity Accounts.*—The accounts of the municipal electricity undertaking for the year ended March 31st last show an output of 584,994 units, an increase of 252,113 units over the output for the previous year. The revenue amounted to £4.673, and the working costs to £2,179. After meeting capital charges, there remains a net profit of £354. The total capital expenditure to date amounts to £35,444, of which £2.795 were expended during the year just ended. The total works costs were 0·86d.

DEVONPORT: *Tramway Company to be Summoned.*—The Tramways Committee have instructed the Town Clerk to issue summonses against the Devonport & District Tramways Co. for penalties for refusing to run their cars over the lines leased from the Corporation. It may be remembered that a short while ago the company ceased to run a service over the leased lines for the reason that they were unremunerative, and that the Corporation refused to meet them in the matter of reduced rents or reductions in the charge for electricity.

DUNDEE: *Trackless Trolley System.*—The Tramways Committee have rejected a proposal by the Tramways Sub-Committee to install the trackless trolley system along a route, including the Esplanade. Mr. Peter Fisher, the Tramways Manager, expressed the opinion that the experiment would prove successful, but the Tramways Committee passed a resolution against it by 15 votes to 7.

EALING: *Tramway Centre Standards.*—The Council recently inquired into the cost of removing the centre tramway standards of the London United Tramways Co. to the sides of the roads, and the Surveyor has estimated that it would require the sum of £5.000 to carry out the work. The Highways Committee have recommended that there is not sufficient justification at present to incur the expense involved.

GLASGOW: *The Tramways and Electricity Undertakings.*—A report has been presented by Mr. James Dalrymple, the General Manager of the Corporation tramways, and Mr. W. W. Lackie, the Electrical Engineer to the Corporation, in which they comment upon a proposal to rearrange the working of the tramways and electricity departments. This report points out that during the winter of 1906-7 arrangements were made whereby the two departments could supply each other with electrical energy in case of need, and it is considered inexpedient to make any change in these arrangements. Further, the report states that no substantial benefit would accrue by disturbing in any way the present working arrangements between the two Committees, unless and until some change of circumstances should arise which might require the whole question of the production and distribution of electrical energy to be considered anew. It is further recommended that the two departments should be allowed to complete the work in hand along the present lines.

GREENOCK: *Electricity Extensions.*—In reporting to the Secretary for Scotland upon a loan of £25,000 which has been granted to the Corporation for electrical extensions, the examiner of the accounts states that the capital expenditure upon the undertaking has not been in any way excessive, having regard to the economical construction and effective value of the undertaking; that the extensions for which the loan has been granted are absolutely necessary in order to meet the natural calls upon the undertaking during the next two years; and that the general administration of the undertaking has been conducted on a sound financial basis.

HALESOWEN: *Tramways.*—The Council are negotiating with Mr. G. Balfour for the transfer of their light railway order. Some delay has been occasioned, however, owing to a dispute with the Worcestershire County Council as to their responsibility with regard to certain street widenings. A sub-committee has been appointed to wait upon the county authority to urge them to adhere to their original decision to provide the land for these widenings.

HEREFORD: *Electrical Exhibition.*—The Electricity Department of the Council is promoting an Electrical Exhibition, which will be held in the Drill Hall.

HERNE BAY: *Electric Lighting Provisional Order.*—In granting the Council's application for an electric lighting provisional order, the Board of Trade have inserted the "Northumberland" clause.

HINDHEAD: *Electric Lighting.*—The Hambledon Rural District Council, in opposing the Hindhead Electric Lighting Provisional Order now before the Board of Trade, asked that the maximum price should be reduced from 8d. to 6d. per unit. The Board of Trade refuse to do this owing to 8d. being the universal maximum. In granting the Order, however, they had met other objections of the Hambledon Council by excluding certain districts.

HYTHE: *Tramways.*—The Council have retained Mr. Vesey Knox, K.C., to oppose, on their behalf, the Folkestone, Sandgate, and Hythe Tramways Bill in Parliament.

LAUNCESTON (Tasmania): *Electric Supply.*—The report of the City Electrical Engineer for 1908 states that the total revenue for the year was £17,682, as against £16,286 for 1907. The total working expenses were £8,077, an addition of £646 over 1907. After writing off bad debts amounting to £294—which have been standing over from former years—the balance carried to the net revenue account is £9,310. The report again points out that the amount received for the street lighting of the city is inadequate. The revenue received was 68 per cent. of the cost to the department, and if only the actual cost had been paid, the amount would have been £1,215 more, and the surplus would have been increased by this amount. The actual surplus on the year's working, after meeting capital charges, is £2,107, an increase of £550. The units sold were over 1½ millions, and the total costs have decreased nearly one-tenth of a penny per unit sold. The maximum load for the year reached 760 kw., an increase of 80 kw. over the maximum load for 1907. The department now supply metal filament lamps at cost price, or renew them on an equivalent money basis with regard to the free lamp renewal system now in force—*i.e.*, if a consumer is entitled to eight ordinary 8-c.p. carbon filament lamps he can obtain one of the new metal filament lamps free, and should the consumer not be able to claim a sufficient number of lamps under the system to obtain a new one free he may pay the difference. Radiators and irons still continue on the increase, and appear to be more extensively used here than anywhere in the Commonwealth, considering the population. The demand for power still continues, there being a large increase during the year, making the total connected in the aggregate 1,067 b.h.p.

LEEDS: *Trackless Trolley System.*—The deputation from the Leeds Tramways Committee which has visited the Continent during the past ten days to investigate the working of the trackless trolley system, returned on Saturday. It is stated that they will report in favour of introducing the system to the Farnley district in place of the present motor omnibus service.

LONDON: *City of London: Street Lighting.*—The deputation from the City Corporation which was appointed to visit certain Continental cities to study methods of street lighting has now returned. The cities visited were Brussels, Dusseldorf, Cologne, Berlin, Dresden, Vienna, Munich, and Paris. The report of the

Digitized by Google

deputation is being prepared, and will be presented to the Council very shortly.

Hackney: Tramways.—The arbitrator has given his award with regard to the materials to be used for the paving between the tram rails and in the clear way in Mare Street, Clapton Road, and Clapton Common. The Borough Council's requirements have been sustained as regards 4,190 lineal yards, and the L.C.C.'s objections maintained as to 281 lineal yards, and the Borough Council claims the result represents a saving to it of £400 per annum.

Islington: Tramways.—The Borough Council have now agreed to contribute one-third of the cost of the necessary street widenings in connection with the Essex Road tramways, and the conversion of the existing horse tramways to the conduit system has been put in hand. The amount which the Borough Council will have to find is £10,000.

Shoreditch: Railways and Tramway Competition.—The North London Railway Co. have, in consequence of the competition of electric trams and motor omnibuses, served notice upon the Borough Council requiring the reduction of the present assessment of the railway, which is £21,700 gross and 15,500 rateable, to £17,256 gross and £11,056 rateable. The Council, while they are to resist the application, have decided to seek to raise the assessment of the tramways in the borough, which is now £7,400 gross and £3,000 rateable, to £14,400 gross and £10,200 rateable.

LOWESTOFT: *Tramways.*—The Council have decided to offer for sale the East Anglian Light Railway Order, which was acquired from some private promoters a few years ago. The traffic receipts from the municipal tramways for Easter were £120. or £12 less than the figure for the corresponding period of last year.

MOUNTAIN ASH: *Electric Supply.*—An agreement has been entered into with the South Wales Electrical Power Distribution Co. for the supply of electrical energy in bulk.

OXFORD: *Tramways.*—A draft agreement has been prepared setting forth the terms upon which the National Electric Construction Co. are prepared to work the tramways, and which the Tramways Committee recommend should be accepted. This agreement provides for the installation of a combination of the conduit and overhead trolley systems, and the payment of a rent by the company of £1,100 per annum for 42 years.

ROCHDALE: *Tramways.*—Last year the Tramways Committee were compelled to ask for a rate of 2½d. in order to meet the deficit upon the tramways undertaking. The working for the year ended March 31st, 1909, however, has been much more satisfactory, and a rate of only 1d. is asked for. The total income from the tramways is £57,270, against £56,557 for the previous year. After meeting interest and sinking fund charges, the net loss is £189.

SOUTH SHIELDS: *The Tunnel Under the Tyne.*—It is understood that Mr. Ernest Schenk, on behalf of the promoters of the proposed electric railway under the Tyne, Parliamentary powers for which were granted several years ago, will submit fresh proposals in order to secure the co-operation of the local authorities whose districts would be benefited under the scheme. It will be remembered that a recent proposal that the North and South Shields and Tynemouth Corporations should guarantee the debenture interest at 4 per cent. upon £100,000 was rejected. It is stated that the directors of the North Eastern Railway Co. are disposed to consider the possibility of contributing towards the necessary guarantee of the debenture capital interest, and that a deputation from the South Shields and Tynemouth Corporation has been appointed to wait upon the directors of the railway company to obtain information on this point.

STALYBRIDGE, &c.: *Electricity and Tramways.*—At the monthly meeting of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board recently, it was reported that borrowing powers had been exercised to the extent of £483,990, and that loans amounting to £47,757 had been repaid, leaving the amount of loans outstanding at £436,233.

SWANSEA: *Electricity Works Profits.*—It is estimated that the profits from the electricity undertaking for the year to March 31st will amount to £2,000.

I.M.E.A. Meeting.—At the meeting of the Electric Lighting Committee last week, the Chairman, Mr. Sinclair, raised the question of appointing delegates to the annual meeting of the Incorporated Municipal Electrical Association at Manchester in June. He stated that he himself was reading a Paper, and would attend any way. The Committee decided to appoint the Chairman and the Engineer, Mr. C. A. L. Prusmann, to attend the meeting as representatives of the Corporation.

SWINDON: *Electricity and Tramways Undertaking.*—The Electricity and Tramways Committee recommend that a report on the tramways and electricity undertakings be furnished by a competent person with a view to recommending certain matters which may increase the receipts and decrease the expenditure, and also that the electrical engineer and tramways manager be requested to prepare a private and confidential report on similar lines.

YORK: *Tramways System.*—At a meeting of ratepayers a resolution urging the Council to retain the control and working of the tramways system, was passed.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BRAY.—A Local Government Board inquiry is to be held into an application to borrow £2,600 for extensions, including a suction gas engine and producer plant, section boxes, &c.

COPENHAGEN.—H.M. Consul at Copenhagen states that tenders are invited by the Corporation for electric light cables of various sizes. Tenders to Direktoren for Belysningsvaesenet, Raadhuset, Copenhagen, and marked "Tilbud paa Vekselstroms-Kabler," by May 3rd. The conditions and specifications (in Danish) can be seen by British firms at the Commercial Intelligence Branch of the Board of Trade.

GREENOCK.—A loan of £25,000 has been sanctioned by the Secretary for Scotland for electricity extensions.

INDIA.—The Lahore Municipality contemplate an expenditure of about £90,000 upon electric lighting.

LOWESTOFT.—New cable is to be laid at an estimated cost of £90.

ROSARIO.—Additional generating plant to the extent of 4,000 h.p. is to be installed by the Rosario Electric Co.

WEST INDIES.—The Anglo-American Debenture Corporation, Ltd., are about to commence operations in Barbados to introduce electric lighting and power. An expenditure of £100,000 is contemplated.

WORCESTER.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £5,752 for electrical extensions. This sum includes £852 excess expenditure. The remainder is for mains.

Miscellaneous

AUSTRIA HUNGARY.—The Hungarian Government has granted concession for a number of railways, including the following, which will be worked electrically. Vácz to Budapest and Gödöllö, cost 9,000,000 crowns (£375,000); Hölak to Trencsenteplitz, length 6 kilometres, cost 667,000 crowns (£27,792). H.M. Consul-General has forwarded the names of the concessionaires for the above-mentioned railways, and these, together with further particulars of the concessions (in Magyar), may, says the *Board of Trade Journal*, be seen by British firms on application at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

LIVERPOOL.—A scheme for extending the tramways in the Everton district at a cost of £11,000 is recommended by the Tramways Committee.

SALFORD.—Tenders are invited for the provision and erection of private telephones at the Town Hall. Particulars from the Borough Engineer and tenders to the Town Clerk by April 29th.

SUNDERLAND.—Tenders are invited for the supply of cables for the municipal tramway system. Particulars from the Tramway Manager, and tenders to the Town Clerk by April 29th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON: E.C.—Adaptation of 79 and 81 Aldgate and the Minories for branch of London & South Western Bank. Builder, Howell J. Williams, Ltd., 11-17 Bermondsey Street, S.E.

Buildings, Cheapside and Wood Street. Builders, Colls & Sons, Ltd., and G. Trollope & Sons, 5 Coleman Street, E.C.

N.W.—Church in the Parish of St. Michael's, Cricklewood (£10,000). Rev. T. D. Lloyd, vicar.

S.W.—Buildings, Prince Consort Road, for School of Mining and Metallurgy. Sir Aston Webb, 19 Queen Anne's Gate, S.W.

Buildings, Exhibition Road, for City Guilds Institute. Sir Aston Webb, 19 Queen Anne's Gate, S.W.

W.—Buildings, Oxford Street and Rathbone Place. Builders, Prestige & Co., 149 Grosvenor Road. S.W.

W.C.—Adaptation of part of Old Holborn Town Hall, Gray's Inn Road, for branch of the National and Provincial Bank of England. Head Offices, 112 Bishopsgate Street Within, E.C.

PROVINCES.

BEXHILL-ON-SEA.—Additions to Kursaal. C. Ball, Town Hall, Bexhill-on-Sea.

BLACKPOOL.—Wesleyan Church. F. Lamb, Burley Street, Blackpool.

BOOTLE.—Reading-room (£7,500). Borough Engineer, Bootle, Liverpool.

Digitized by Google

BRIGHTON.—Training college. Architects, Simpson & Sons, Ship Street, Brighton.

BRISTOL.—Bank premises for Stuckey's Bank, Ltd. Architects, Drake & Pezey, Bank Chambers, Baldwin Street, Bristol.

DERBY.—Church School, St. Augustine's. Architects, Naylor & Sale, Derby.

GATESHEAD.—Asylum (350 places). Visiting Committee, Gateshead Asylum.

GREENOCK.—Church and institute. Stewart & Alexander, Hamilton Street, Greenock.

HORNSEY. St. Mary's Parish Church is to be wired for electric lighting.

LIVERPOOL.—Out-patients' depôt. Royal Southern Hospital (£8,000). Architects, Haigh & Thomson Exchange Street, Liverpool.

WATFORD.—St. Michael's Parish Church is to be wired for electric lighting.

TENDERS RECEIVED AND ACCEPTED

BRAY.—The Council have accepted the following tenders for year's supply of stores:—Carbon and metal filament lamps, the Electrical Co., Ltd.; carbons, Crompton & Co.; electrical fittings and accessories, the General Electric Co.; wires and cables, Marples, Leach & Co.; oils, Wakefield Oil Co.; engine-room stores, Tuck & Co., Dublin.

CARDIFF.—The tender of Messrs. Siemens Bros. & Co., Ltd., has been accepted for switchboard extensions at £475.

CLACTON.—The tender of Messrs. Herbert Morris & Bastert has been accepted at £157 for a 13-ton travelling crane at the electricity works.

DARLINGTON.—The following tenders were received for a 500-kw. exhaust steam turbo-generator recently advertised for:—The Brush Electrical Engineering Co., £2,000; British Westinghouse Electric & Manufacturing Co., £2,670; C. A. Parsons & Co., £2,850; Belliss & Morcom, £2,880; Jas. Howden & Co., £2,953; Fraser & Chalmers, £3,228; Electric Construction Co., £3,260, £3,375, and £3,320; British Thomson-Houston Co., £3,505; Willans & Robinson, £3,800; Siemens Brothers & Co., £3,860; Musgrave & Sons, £3,898; P. J. Mitchell (Rateau turbine), £3,950; Richardsons, Westgarth, £3,980; and the Electrical Co., £4,150.

GRAYS.—The tender of the Brush Electrical Engineering Co. has been accepted at £379 for the supply of three electrically-driven centrifugal pumps.

LONDON: *Hackney.*—The Electricity Committee have accepted the offer of Messrs. Cory & Son, Ltd., to supply 4,000 tons of Cowdenbeath and Edinburgh Washed Peas at 10s. 3d. per ton.

Hammersmith.—The Council received the following tenders for the supply and fixing of additional panels to the main switchboard:—British Westinghouse Co., Ltd. (accepted), £124 10s.; Switch-Gear Co., Ltd., £150; Spagnoletti, Ltd., £160; Cowans, Ltd., £175 15s.; Johnson & Philips, Ltd., £180; Ferranti, Ltd., £192 5s. The Council has accepted the tender of H. F. Harrison for the supply of 30 lanterns and brackets at 14s. 6d. each in connection with the conversion from gas to electricity of the street lighting in Latimer Road.

LOWESTOFT.—Upon the recommendation of the Electric Lighting Committee the tender of Messrs. Crompton & Co. for a 250 kw. generating set at £1,313 has been accepted. It was stated at a recent meeting of the Council that this is almost exactly one-half the price paid for a similar set eight years ago.

NEWPORT (Mon.).—The tender of Messrs. Dick, Kerr & Co., Ltd., has been accepted for the supply of three single truck double-deck tramcars. The following tenders have also been accepted:—Incandescent lamps, General Electric Co. and Ediswan Co.: radiator lamps, the Ediswan Co.: flame arc lamp carbons, Oliver Arc Lamp Co.: meters, Electrical Co., Chamberlain & Hookham, and Ferranti, Ltd.

SWINDON.—The following tenders have been accepted:—Weighbridge, Messrs. H. Pooley & Son, £79; water softener pump, the Worthington Pump Co., £31; circulating pump, Messrs. Crompton & Co., £109; superheater, Messrs. Babcock & Wilcox, £175; megger, Messrs. Evershed & Vignoles, £23; switchgear, Messrs. Brook, Hirst & Co., £46.

Tramways and Telephone Exchanges.—For some time attempts have been made to arrive at an agreement as to who should bear the cost of the fuses and heat coils which are put in for the protection of telephone exchanges from damage due to accidental contact between telephone lines and overhead tramway conductors. The Postmaster-General contends that the cost should be borne by the tramway authority, and after some correspondence the tramway undertakings, through the Tramways and Light Railways Association, agreed to accept the ruling of an arbitrator on the subject. From various causes, the appointment of an arbitrator was delayed, but some correspondence published in the April circular of the Association shows that the arbitration is likely to take place in the near future. The case selected is that under the Weymess Tramway Order, and the Board of Trade have now definitely been asked to appoint an arbitrator.

COMPANIES' MEETINGS AND REPORTS

HAVANA ELECTRIC RAILWAY CO.—The report for 1908 shows net earnings amounting to $575,601, an increase of $155,684 compared with 1907. A dividend of 6 per cent. is declared upon the preferred stock, and 1 per cent. on the common stock, leaving $200,967 to be carried forward. During 1908 a decree was issued by the Government of Cuba, giving authority to the company to construct about thirty miles of extensions.

CUBA SUBMARINE TELEGRAPH CO.—At the half-yearly meeting last week, the report and accounts given in our last issue were adopted. Mr. George Keith, who presided, stated that with the prospects of a good sugar crop this year, the falling off in the receipts last half-year compared with corresponding period of the previous year, should be easily recovered. In addition to the sugar crop, the general trade of the island was now much better.

BABCOCK & WILCOX.—The report for 1908 shows a profit of £340,279, including the balance brought forward from the previous year. Interim dividends of 3 per cent. on the preference shares, and 8 per cent. on the ordinary shares were paid in August, and the directors now recommend a dividend of 3 per cent. on the preference shares; a dividend of 8 per cent. on the ordinary shares; and a bonus of 4 per cent. on the ordinary shares. After placing to the reserve fund the sum of £100,000, and to the dividend equalisation fund £25,000, there is a balance to be carried forward of £43,279.

DEUTSCHE - ATLANTISCHE TELEGRAPHEN GES., COLOGNE.—The report for the year 1908 shows a net profit of 2,578,479 mk. (approx., £128,800), as against 3,118,054 mk. in the previous year. Of this, 107,720 mk. is transferred to the reserve fund, and 200,000 mk. to the special reserve and depreciation fund. After allowing for sundry other amounts and 445,421 mk. carried forward to the new account, a sum of 1,680,000 mk. remains to be paid out at a dividend of 7 per cent., as in the previous year.

MELBOURNE ELECTRIC SUPPLY CO.—The report for the year ended August 31st, 1908, shows that the capital expenditure during the year amounted to £32,295. The gross profits from the Melbourne and Geelong undertakings, which are controlled by the company, amount to £17,677, and the total available, which includes interest on the company's holding of ordinary shares in the Adelaide Electric Supply Co., &c., is £22,059, against £19,741 for the previous year. After meeting all expenditure, &c., and adding the balance brought forward of £1,594, there is a net profit of £6,882. The sum of £4,000 has been carried to reserve, £1,110 has been applied in writing off cost of loans, and the balance of £1,771 is carried forward. An issue will shortly be made of £100,000 first mortgage debenture stock, and £100,000 first preference shares. This issue of new capital will have the effect of paying off the company's floating debt, and providing the necessary means for extending the undertakings at Melbourne and Geelong.

ISLE OF WIGHT ELECTRIC LIGHT & POWER CO.—The report for 1908 shows that the total connections of the company's undertakings were as follows:—Ventnor and Bonchurch, 21,074 8-c.p. lamps; Sandown and Shanklin, 19,392 8-c.p. lamps; Newport and Cowes, 34,435 8-c.p. lamps; Ryde and St. Helens, 19,904 8-c.p. lamps, making a total of 94,905 8-c.p. lamps, compared with 89,300 last year. In each case there is an increase over the previous year. The year's trading, including a balance of £190 brought forward, shows a profit of £11,391, and after paying interest on debentures, interest on loans, and the preference dividend, there remains a balance of £3,795. The directors recommend that £2,500 be placed to reserve fund, and the balance of £293 carried forward. The meeting is to-morrow.

GUILDFORD ELECTRICITY SUPPLY CO.—At the annual general meeting last week, the report and accounts given in our issue for April 8th were adopted. It was stated that in future the preference share dividend will be paid half-yearly instead of yearly. It was further announced that the whole of the debenture capital had been placed.

CORK ELECTRIC TRAMWAYS & LIGHTING CO.—At the annual meeting in London on Thursday, the report and accounts were adopted. Mr. A. R. Monks, who presided, stated that negotiations were going on with the Cork Rural District Council for the company to take over their electric lighting provisional order.

Electric Tramcars and Street Accidents.—A police return has been issued showing for England and Wales the number of accidents resulting in death or personal injury which have been caused by the various classes of vehicle in public streets during the period from May 1st to December 31st, 1908. From this it is seen that mechanically-propelled tramcars have been responsible for 69 fatal accidents, and 2,809 non-fatal accidents, out of a grand total of 746 fatal accidents, and 17,227 non-fatal accidents. Motors-cars were the cause of 198 deaths and 4,501 non-fatal accidents, and motor omnibuses caused 50 deaths and 1,106 non-fatal accidents.

Digitized by Google

MISCELLANEOUS CITY NOTES

TELEPHONE COMPANY OF EGYPT.—A dividend of 4 per cent., less income tax, is recommended upon the preferred and deferred shares for the December half-year, making 10 per cent. for the year. The sum of £500 is placed to reserve for the contemplated pension scheme, and the balance of £25,782 carried forward.

BRITISH COLUMBIA ELECTRIC RAILWAY CO.—An interim dividend of 8 per cent. per annum is recommended upon the deferred ordinary shares for the half-year to December 31st, 1908.

GUILDFORD ELECTRICITY SUPPLY CO.—Issue of £1,100 debentures, part of a series of which particulars have already been filed.

TORQUAY TRAMWAYS CO.—Issue of £60,000 debentures, being the whole of a series created Nov. 26th, 1908, charged on the company's undertaking and property, present and future, including uncalled capital. Trustees, L. B. Schlesinger and Sir Nathaniel Nathan.

ELECTRIC SUPPLY CORPORATION.—Trust deed, dated July 18th, 1904, was stamped on April 1st, 1909, to cover a further £10,000 (in addition to £100,000 already registered). Property charged—The company's undertaking and property, present and future, including uncalled capital. C. F. Tufnell, Kenley, Surrey, and W. B. M. Bird, 58 Cadogan-place, S.W.

MONTE VIDEO TELEPHONE CO.—An interim dividend of 5 per cent. per annum on the preference shares, and 6 per cent. per annum on the ordinary shares, has been declared for the half-year to Jan. 31st.

ENGINEERING INSTRUMENTS.—The order of the High Court confirming the reduction of the capital of this company from £50,000 to £31,562 10s. has been registered by the Registrar of Joint Stock Companies.

LOCH LEVEN WATER & ELECTRIC POWER CO.—An extraordinary general meeting will be held on April 27th, when resolutions will be submitted with regard to the borrowing of money on mortgage to the extent of £240,000.

UNDERGROUND ELECTRIC RAILWAY COMPANIES OF LONDON.—The coupon falling due on May 1st of the 5 per cent. prior lien bonds will be paid on and after that date at the London and Westminster Bank, in London.

MONTREAL LIGHT, HEAT & POWER CO.—A dividend of 1½ per cent. is recommended on the ordinary shares for the quarter to April 30th.

W. GRIFFITHS & CO.—A scheme of reconstruction will be placed before a general meeting on April 28th. The *Financial Times* states that it is proposed to form a new company with a capital of £157,500, in 275,000 shares of 10s. each, and power to issue £50,000 first mortgage debentures, carrying interest at 5 per cent. as from May 1st, 1909. Under the proposed plan preference shareholders will receive £2 10s. in debentures and five fully-paid 10s. shares for each £5 share now held, and ordinary shareholders will receive five fully-paid 10s. shares for each £5 share now held.

Leeds Section of the Institution of Electrical Engineers.—The following are the nominations made by the committee for the officers and committee for the ensuing session:—Chairman, Mr. W. M. Rogerson (Borough Electrical Engineer and Tramways General Manager, Halifax); Vice-Chairman, Mr. T. Harding Churton; Committee: Mr. A. B. Mountain (Borough Electrical Engineer, Huddersfield), Mr. W. Hartnell, Mr. A. J. Cridge (Meter Superintendent, Sheffield Corporation Electricity Department), Mr. H. H. Wright, Mr. S. D. Schofield (Engineer and Manager, Corporation Electricity Works, Shipley); Hon. Sec., H. Dickinson (Manager, Corporation Electricity Works, Leeds). Further nominations are invited and will be received up to Saturday, May 1st; but if none are forthcoming, the above will be elected in accordance with the rules. The annual general meeting will be held on May 5th, when a paper will be read by Mr. W. F. Mylan, on "Electrification of Steam-driven Non-reversing Rolling Mills."

Electricity from Sunshine.—According to the *Electrical Review* (New York), an installation has been arranged by a Mr. G. H. Cove, at Somerville, Mass., in which the heat of the sun's rays is employed for generating electricity for lighting a workshop by means of a special thermopile. The apparatus consists of a steel framework, which is placed where it will receive the direct rays of the sun. Short plugs of a metallic composition, the constitution of which is held secret by Mr. Cove, are set into this framework, which is divided into sixteen spaces, each 1 ft. square. Each square contains sixty-one plugs. These plugs are set with one end under glass while the sun shines on them. The other ends are exposed to the open air, and sheltered from the sun's rays, so that there is a considerable difference in temperature of the two ends. The thermopile is connected to a storage battery. If the sun goes under a cloud, and the voltage drops below that of the battery, an automatic circuit-breaker disconnects the thermopile from the battery, and in this way, when the sun sets in the evening, the circuit is automatically broken. In the lighting installation 10-volt, 16 c.p. tungsten lamps are used. The plant is stated to be able to store in one sunny day sufficient energy to light five 16 c.p. lamps for three nights, averaging four hours per night for each lamp.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars net c.i.f. port of arrival, quoted on Tuesday night, was £58 10s. to £58 15s. (Last week, £58 15s. to £59 5s.)

INCANDESCENT LAMPS.—The *Board of Trade Journal* states that an inquiry has been received at the British Consulate-General at Vienna from a firm in that city who desire to get into communication with British firms who could completely equip a factory for the manufacture of incandescent electric lamps, or supply the machines and apparatus for their manufacture. Communications from British firms referring to the above should be addressed to the British Consulate-General at Vienna.

MESSRS. BALCHIN, SCHULZ & CO.—This firm have opened a branch of their business at Prudential Buildings, 97 Above Bar, Southampton, for dealing with the installation of electric light and power in country and town houses, factories, ships, yachts, &c. They will be pleased to receive at the above address latest price lists from electrical and machinery manufacturers.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS UP, &c.—Mr. H. J. Haley, of 29 Tyrrel Street, Bradford, has been appointed trustee in the bankruptcy of Arnold Roberts, electrical engineer, 21 North Parade, Bradford.

A meeting of the Electromobile Hiring Co., Ltd., will be held at 7 Hertford Street, Mayfair, London, on May 18th, at 4 p.m., for the purpose of hearing the liquidator's account of the winding up.

Messrs. G. M. White, 14 Old Jewry Chambers, London, and A. Farlow, 50 Gresham Street, London, chartered accountants, have been appointed trustees in the bankruptcy of C. H. W. Biggs, trading as Biggs and Sons, publishers of *The Electrical Engineer*, &c., 139 and 140 Salisbury Court, London, E.C.

An application for the discharge of W. T. Garnett, trading as W. T. Garnett's Cable Co., Barkerend Mills, Bradford, will be heard in the County Court, Manor Row, Bradford, on May 18th at 10 a.m.

Parliamentary Intelligence.—The County of Durham Electric Power Supply Bill was read a third time in the House of Lords on Tuesday.

The second reading of the Watford and Edgware Railway Bill, which was down for Monday last, has been postponed until next Monday.

Imperial College of Science and Technology.—The first annual report of the governing body of the Imperial College of Science and Technology for the year ended July 31st, 1908, has been published. The only matter of electrical interest is the announcement that the Council of the Institution of Electrical Engineers are prepared to favourably consider their co-operation in the equipment of an electrical engineering laboratory at the Imperial College, in memory of the late Lord Kelvin. The report further states that the Governing Body have appointed temporary sub-committees or advisory boards. The sub-committee dealing with engineering, with the exception of mining, is presided over by Sir John Wolfe Barry, K.C.B., F.R.S.

Alterations to the American National Electrical Code.—At the annual meeting of the Underwriters' National Electric Association held in New York in March, the suggestions of the various committees for the revision of the National Electrical Code were considered and acted upon. According to the *Electrical World* (New York), the following were the chief alterations made:—The rule relating to circuit-breakers was changed to read as follows: "Excepting on main switchboards or when subject to expert supervision, automatic, overload, circuit-breakers will not be accepted for the protection of alternating-current motors unless fuses are also provided in each phase. For single-phase motors, one side of the line may be protected by an approved automatic, overload, circuit-breaker and the other by a fuse." This note applies up to the maximum capacity for which enclosed fuses are approved. For circuits above that capacity, circuit-breakers only will be required. Some modifications were made in the rules relating to distribution boards or boxes: the box must be deep enough to permit the closing of doors when switches of 25 amperes rating or less are in any position. There must be a space of at least ½ in. between the walls and back of a box and any live part. A space of at least 2 in. must be provided between open link fuses and metal, metal-lined or glass-paneled doors. A space of at least 1 in. must be provided between the door of any box and an enclosed fuse or any live metal part. The section relating to the wiring for fire alarm and other low-voltage signalling systems was also modified. The rule relating to motor-starters was amended to read as follows: "Motor starting rheostats for direct-current circuits must be so designed that the contact arm cannot be left on intermediate segments, and must be provided with an automatic device which will interrupt the supply circuit before the speed of the motor falls to less than one-third of its normal value. For alternating-current circuits the automatic interrupting device may be omitted."

Digitized by Google

NEW COMPANIES

MERSEA MOTOR & ELECTRIC CO.—Registered on March 30th, with a capital of £2,000, to establish and maintain communication by steam, spirit, or electrical power motors, lorries, tramways, railways, or boats between the island of Mersea and London, Colchester, Brightlingsea, Tollesbury, or elsewhere. Private company. The number of directors is not to be less than two nor more than seven; the first are E. E. Meade, J. J. Edwards, and J. H. Gardner. The directors may increase the capital to £10,000. Registered offices: 90-91 Queen Street, E.C.

POWER ENGINEERS.—Registered on March 30th, with a capital of £2,000 in £1 shares, to carry on the business of electrical, mechanical, and civil engineers, manufacturers of and dealers in electrical and other machinery and appliances, &c. The subscribers are: W. B. Esson, Bank Buildings, Kingsway, W.C., electrical engineer; R. B. Matthews, 196 Eaton Crescent, Swansea, electrical engineer. Private company. The number of directors is not to be less than two nor more than five; the first are W. B. Esson and R. B. Matthews. Qualification, 100 shares. Registered office: Bank Buildings, Kingsway, W.C.

SOLENT DISTRICT ENGINEERING AGENCY.—Registered on March 30th, with a capital of £500 in 100 ordinary shares of £1 each, and 40 preference shares of £10 each, to carry on the business of agents for mechanical, electrical, marine, automatic, and hydraulic engineers, founders, manufacturers, and factors of machinery, implements, rolling stock, &c. Private company. The numbers of directors is not to be less than three nor more than five: the first are C. H. Beadle, D. Bicker-Caarten, and A. Arkell-Hardwick. Qualification, £5. Remuneration as fixed by the company. Registered by C. Doubble, 14 Serjeants Inn, E.C.

"LE RADIANT."—Registered on March 30th, with a capital of £25,000 in £1 shares (7,500 participating preference), to acquire from C. Fonteyn a contract for selling the apparatus known as "Le Radiant," and the patent rights for the United Kingdom, in an electric oven, to adopt an agreement with the said vendor, and to carry on the business of electricians, mechanical engineers, producers, and workers of and dealers in electricity, &c. Minimum cash subscription, £100. The number of directors is not to be less than two nor more than five: the first are C. Fonteyn and A. Slater. Remuneration, £100 each per annum, and 5 per cent. of the net profits, dividend. Registered office: 34-35 High Holborn, W.C.

BROWNE ENGINEERING CO.—Registered on April 5th, with a capital of £50,000 in £1 shares (5,000 preference), to adopt an agreement with H. J. S. Mackay, W. J. W. Bullock, and H. A. Harvey, and to carry on the business of electrical engineers, electricians, suppliers of electricity for light, heat, motive power, or otherwise, &c. The subscribers are H. E. Sharman, Dixon House, Lloyds Avenue, E.C., engineer; H. J. S. Mackay, Dixon House, Lloyds Avenue, E.C., engineer; H. A. Harvey, Dixon House, Lloyds Avenue, E.C., engineer; A. E. Tessier, 7 Bonsu Road, Twickenham, S.W., engineer; H. B. Poynder, 11 Elmfield Mansions, Balham, S.W., engineer. Private company. The first directors are H. J. S. Mackay, W. J. W. Bullock, H. A. Harvey, and J. A. Smeeton. Remuneration as fixed by the company. Registered by Cox & Lafone, 17 Tower Royal, E.C.

Wireless Telegraphy and Telephony.—The Post Office experiments, which have recently been made under the supervision of Major O'Meara (Engineer-in-Chief) and Lieut. Loring (Inspector of Wireless Telegraphy), were carried out between Hunstanton and Skegness, a distance of 16 miles across the Wash. Low-power installations with simple apparatus were used, and it is expected that several such installations will shortly be in use for communication between small islands. There is already one in use for transmitting messages between Tobermory and Loch Boisdale, in the Hebrides.

The German Colonial Office is drawing up a project for connecting the German islands in the South Pacific with one another by wireless telegraphy, and with Germany itself through the island of Yap, in the Carolines, which is the only island in the Pacific connected with the international cable system.

Two turbine steamers, the *Victorian* and the *Virginian*, of the Allan Royal Mail Line, engaged in the Canadian service from this country, are being fitted with wireless apparatus. The Liverpool steamers and two of the Glasgow ships of this line are already fitted.

On a chart of the North Atlantic recently issued by the Meteorological Office, eleven wireless stations are shown in the British Isles, twenty-two up the Mediterranean, twenty-four in Canada and Newfoundland, and five on the east coast of the United States. Another chart issued by the United States Hydrographic Office shows thirty wireless stations on the east coast controlled by the United States Navy and fifteen on the Pacific coast, where there are also five under the control of the Army. Six stations are indicated in British Columbia.

The Parliamentary estimates of the Peruvian Government for the year included £4,556 for the maintenance of wireless stations at Orellana, Requena, and Italia (Iquitos).

APPOINTMENTS AND PERSONAL NOTES

Mr. A. H. Seabrook, chief electrical engineer to the West Ham Corporation, is recommended for the post of electrical engineer to the St. Marylebone Borough Council at a salary of £800 per annum, in succession to Mr. F. A. Wilkinson.

On Friday evening, the 16th inst., the Clyde Valley Electrical Power Company, Glasgow, held their annual smoking concert, at which Mr. R. B. W. Pirie, who is leaving for Vancouver, was presented with a suit case and gold watch by his colleagues and friends. Mr. D. A. Starr, the general manager of the company, made the presentation, and referred to Mr. Pirie's long service with the company, and to his popularity and gifts as an organiser. Bailie Willock, Convener of the Glasgow Electricity Committee, also made a short speech.

Mr. John Conacher, General Manager of the Metropolitan Electric Supply Co., Ltd., has been appointed to a seat on the board of the Cambrian Railway. Mr. Conacher has been general manager of the North British Railway Co., and previously to that was secretary and general manager of the Cambrian Railways.

The salary of Mr. W. Weeks, who was appointed assistant engineer to the Shoreditch Borough Council in September, 1907, at £200, is to be increased by £25 per annum, with a further increase of £25 twelve months hence.

Mr. A. H. Unwin, General Manager of the Rosario Electric Company, has, says the *Review of the River Plate*, returned to the Argentine from a visit to England, where he went to confer with his directors regarding extensions of the service.

"A Text-Book of Sound." By Edmund Catchpool. Fifth Edition. (London: University Tutorial Press, Ltd.) 4s. 6d. net.

"Technical Electricity." By H. T. Davidge and R. W. Hutchinson. Second Edition. (London: University Tutorial Press, Ltd.) 4s. 6d. net.

Electrification of the Victorian State Railways.—As we recently announced, Mr. C. H. Merz has replied to the Railway Commissioners, maintaining his original contention that the electrification of the Victorian State Railways would be commercially practicable. The Commissioners, however, repeat their previous suggestion that by shortening the block sections the steam trains could be made to show equally good results with much less capital expenditure, and they once more recommend that the electrification of the Melbourne suburban lines should not, either in whole or in part, be undertaken at the present time.

Telegraph Traffic.—The cable between Martinique and Guadeloupe was repaired on the 12th inst., thus restoring the connecting link between the systems of the French and West India and Panama Telegraph Companies.—The line between Teheran and Astrabad gave out on the 13th inst., and telegrams for the province of Manzanderan were sent *via* Krasnowadsk-Tschikischliar.—On the same day the cable between Hong Kong and Macao ceased working.—On the 14th inst. the *via*-Hanekin route was interrupted between Alep and Bagdad and Mossoul and Bagdad, and communication between Rome and Constantinople ceased.—On the following day the line between Constantinople and Ismid failed to operate. Communication between Rome and Constantinople was, however, restored on the 15th inst. On this day the cable between Obock and Djibouti broke, and telegrams for the latter place had to be sent by boat.—Our prognostications as regards communication with Venezuela have now in part come true, for we learn that the cables of the French company are open for the transmission of Government messages only; private messages still have to be posted from Curaçao or Trinidad. This result has probably been precipitated by the presence of ex-President Castro in the Caribbean, and no doubt when he is again settled in France, and the political situation in Venezuela is more stable, the public will regain their privilege.—Communication between Pontianak and Saigon was restored on the 16th inst., and has been down for a considerable period, as the interruption took place on September 16th, 1908.—The cable between Tourane and Amoy was also restored on April 19th.

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** *weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.*

SUMMARY

MR. H. M. SAYERS writes with reference to Mr. Panton's criticisms of his article on track brakes; and we have received several letters commenting on the article in our last issue of "A Dynamo Designer" on parallel running of three-phase alternators with earthed neutrals. Mr. Roger T. Smith (Electrical Engineer to the Great Western Railway) considers that the solution to the problem lies in not earthing the neutral at all; and Mr. J. S. Peck argues that the trouble of circulating currents is not so serious as has been made out, and thinks that a simple arrangement of hand-switching could be used to effect the same result as the complicated automatic switch described by Mr. Rider in his recent Paper on the Greenwich station. We are obliged to hold over till next week several other letters on this subject. A letter from Mr. B. H. Bedell refers to the publication of Mr. Mordey's reports on the G.B. system and the L.C.C. Tramways. (Page 385.)

IN a lecture on the industrial applications of tantalum, delivered at the Royal Institution on Friday, Mr. Alexander Siemens made some interesting statements with regard to the manufacture of the tantalum filament. The metal is reduced from the ore in the form of a black powder, which is compressed and finally melted in a vacuum into buttons. These metallic buttons consist of pure malleable tantalum, and are rolled and finally drawn into wire. About 45,000 lamps are made from one kilogramme of tantalum. (Page 387.)

MR. W. MAURICE has been elected President of the Institution of Mining Electrical Engineers, and delivered an address in Manchester on Saturday, pointing out the benefits that can be derived from the new Institution. Active steps are now to be taken to enroll members, and a Committee has been formed with a representative in each mining district. (Page 387.)

IN the House of Commons on Tuesday, the Postmaster-General suggested that the best solution of the difficulties arising out of the pending transfer of the National Telephone Co.'s business to the Post Office would be to antedate the time of purchase of the company's undertaking. The progress in wireless telegraphy was also referred to. (Page 388.)

A 3,200 k.v.a. turbo-alternator has recently been installed in the electricity works of the Aston Manor Corporation. The construction of the rotor of this machine is particularly interesting on account of the

Digitized by Google

high speed at which it runs. It has salient poles, but no separate pole-shoes, and the spaces for the field coils are machined out of the solid. The shaft is forged in one piece with the rotor. We give the characteristic curves of the machine, from which it is seen that the voltage rises only 4·5 per cent. when full non-inductive load is thrown off, and 15 per cent. with a full inductive load of 80 per cent. power factor. (Page 389.)

A NEW form of trolley-wire ear is described on page 390.

A STRAIGHT filament tungsten lamp has been put on the market for use in the well-known Tubolite aluminium trough-reflector fittings. Each lamp unit gives 12 c.p. at 25 volts, and consumes 1·45 watts per candle. To allow for expansion and contraction, the filament is supported by springs at each end. Four units can be run in series on 100-volt circuits, but the company recommends parallel running. (Page 391.)

IN a Paper read before the Birmingham Section of the Institution of Electrical Engineers last week, Mr. F. G. C. Baldwin gave some practical notes with regard to the laying and jointing of dry-core telephone cables. Mr. D. Stuart, who was the only speaker in the discussion, made some interesting remarks upon the desirability of utilising an alloy of lead and tin for the sheathing of cables. (Page 391.)

MR. J. A. F. ASPINALL, in his Presidential Address to the Institution of Mechanical Engineers, delivered last Friday, dealt with the subject of railway electrification, confining his remarks mainly to the results of his experience with the Liverpool-Southport line of the Lancashire & Yorkshire Railway. (Page 387.)

THE Engineering Standards Committee have issued a report on reciprocating steam engines for electrical purposes. (Page 394.)

THE Electric Lighting Acts (Amendment) Bill was considered in Committee by the House of Lords on Tuesday, and reported some amendments for third reading. The chief amendment at this stage was an addition to Clause 1, preventing the erection of generating stations upon any land without the authority of a special Act of Parliament or Provisional Order, or the sanction of the Board of Trade. (Page 394.)

MR. SCHENK has withdrawn the Bath Electric Lighting Bill, under which it was proposed to acquire the Bath Corporation Electricity Works.—The Birmingham Corporation are being urged to undertake the manufacture of their own tramway rolling stock.—An application in the High Courts by the Devonport & District Tramways Co. to restrain the Devonport Corporation from proceeding by means of summonses in the dispute concerning the leased lines has been successful. Assisted electric wiring schemes are to be put in force by the Woolwich and Battersea Borough Councils.—The Poplar Borough Council is to ask the Local Government Board and the Board of Trade to institute an inquiry into the circumstances of the G.B. experiment in the Mile End Road.—The accounts of the Manchester Corporation electricity undertaking for 1908–9 show a net surplus of £33,304, and £12,000 are transferred to relief of rates.—The Oxford Corporation has adopted the recommendation of their Committee to compromise with the National Electric Construction Co. for the combination of the conduit and trolley systems. (Page 395.)

Two superheaters are required at Grimsby, and a 300-kw. steam generating set at Llandudno. Tenders for considerable quantities of generating plant and tramway material are invited by the Adelaide Tramways Trust. Six electric cranes are required at the Almeria Docks (Spain). The Lowestoft Corporation advertise the Kessingland Light Railway Order for sale or lease. (Page 396.)

A NET profit of £28,028 is shown by the accounts of the National Electric Construction Co. for 1908, but no dividend has been declared. The accounts of the Urban Electric Supply Co. show a profit of £22,735 for 1908, which falls short by £9,764, however, of the amount required for the 5 per cent. guaranteed dividends. The Dudley, Stourbridge & District Electric Traction Co.'s accounts for 1908 show a profit of £6,136; the South Staffordshire Tramways Co., £506; and the Wolverhampton & District Electric Tramways Co., £2,045. A dividend of 6 per cent. is recommended on the ordinary shares of the Chiswick Electricity Supply Corporation. (Page 399.)

THE discussion on Mr. J. H. Rider's Paper on the L.C.C. tramway system was concluded at Thursday's meeting of the Institution of Electrical Engineers. Mr. W. H. Patchell criticised the exclusive use of chain-grate stokers in that it limited the station to one class of coal; he also thought that the amount of boiler plant was too large and the units too small. Mr. K. Edgcumbe suggested that Mr. Rider's troubles with reverse-current relays were due to the settings being too low. The use of La Cour motor-converters was advocated by Mr. H. M. Sayers, who also thought that two generating stations would have been more economical than the one. Mr. Addenbrooke suggested that advantages would be gained by the use of distilled water for the make-up feed. The large amount of power required to drive the circulating water pumps was attributed by Mr. J. M. Trezise to the loss of water in the strainers. Mr. J. E. Salter asked for an explanation of the high consumption of 2·23 units per car mile of the L.C.C. cars, as against Glasgow's 0·45 units; he was surprised that Mr. Rider did not use compound-wound machines. As a means of overcoming the troubles with circulating currents, Mr. H. Brazil suggested the use of carbon powder resistances, which decreased in value on the occurrence of a fault. Mr. A. D. Clarke criticised the boiler test figures, and Mr. G. W. Howe suggested a method of avoiding the breakdown of the end-coils of induction machines. In a written communication, Mr. R. A. Chattock asserts that it is unnecessary to earth the neutral point of systems of 6,600 volts or less. Several other communications have been received. (Page 401.)

SOME further particulars are given of the troubles experienced at the power stations at Niagara owing to the recent serious accumulations of ice. (Page 404.)

THE electrical industry is not well represented at the exhibition of the Building Trades, now being held at Olympia, but there are a few exhibits of electrical interest. Principal among these are the temporary lighting system of Messrs. Tredegar & Co., a model of a new pattern of electric crane by Messrs. R. Waygood & Co., and a collection of artistic electric light fittings by various makers. (Page 405.)

AMONG the specifications published on Thursday by the Patent Office was one by V. Hope for a starting switch for three-phase motors, in which the running fuses are temporarily short-circuited by copper bars or by larger fuses, but are put in circuit again on releasing the switch-handle. A construction for an enclosed flame arc lamp, comprising a cylinder close to the arc, an inner globe to keep the cylinder hot, and cooling and depositing chambers with metal surfaces in the body of the lamp, is claimed by W. Davy, and the manufacture of pure tungsten wire by rolling and drawing rods of an alloy of tungsten and nickel, and afterwards expelling the nickel by heating the wire in a vacuum, is described in a specification by Siemens & Halske Akt.-Ges. A patent by J. G. Rhodin for plates of secondary cells, formed by inserting rolled-up corrugated lead strip in the holes of a lead frame, expires during the current week. Several patents relating to surface-contact tramway systems have been dropped by non-payment of renewal fees. (Page 406.)

Digitized by Google

Although it is probably too late in the Parliamentary session for the "Daylight Saving Bill" to be passed, yet its consideration by the Select Committee, which has sat frequently and has taken much evidence, will doubtless result in a determined endeavour to pass it next year. Stated roughly, the proposal is that the official time of the country shall be an hour in advance of solar time during the summer months of the year. That this would be to the general benefit of the health and activity of the nation can hardly be disputed, nor that economies would result by a diminution in the number of hours in the year during which an artificial substitute for sunlight is required by the majority of people. It is this latter aspect that is giving some central station engineers alarm. We think, however, that the diminution in revenue to the electricity supply station would not be as serious as might be thought at first sight. Doubtless the result would be more or less to wipe away the first hour of the lighting peak during the summer months, but this might be counterbalanced by increases in revenue brought about indirectly by the passing of the Bill in question. For instance, those who have a combined lighting and traction load will be reassured by the estimate made by Mr. A. L. C. Fell (Chief Officer of the L.C.C. Tramways), in giving evidence before the Committee on Tuesday, that 25 per cent. of the total number of cars which under present conditions lie idle in the depôts would be kept in service for an additional 123 hours during the year, with a resultant increase in profit of between £6,000 and £7,000 a year; added to which the other cars would be running longer hours, so that the total gain might ultimately be £10,000 a year. This would be the result of the longer time available for recreation during the summer evenings. Another point that has been overlooked is the increase in the power load that would result. In practically every process carried out in a manufacturing works, the hourly output is greater by daylight than by artificial light, and a very small decrease in the time each individual motor is at rest means an increase in the number of units sold, which might easily be far greater than that represented by the number of lamp-hours lost. If we overlook the slight decrease in lamp renewals, the station engineer would be the only possible loser in the electrical industry by the passing of the Bill. The capacity of the electricity works, the number of motors and accessories, and the number of lamps and fittings in use would not be affected, so that there would be no loss to the manufacturer.

ARRANGEMENTS FOR THE WEEK

(TO-DAY), THURSDAY, APRIL 29th.

Finsbury Technical College Old Students' Association.

8 p.m. Second annual smoking concert at the Holborn Restaurant, Mr. P. V. McMahon, President, in the chair.

FRIDAY, APRIL 30th.

Electrical Trades Benevolent Institution.

4 p.m. Annual general meeting at the Hotel Cecil.

SATURDAY, MAY 1st.

Junior Institution of Engineers.

7 for 7.30 p.m. Twenty-fifth anniversary dinner at the Hotel Cecil.

WEDNESDAY, MAY 5th.

Institution of Electrical Engineers: Birmingham Section.

7 p.m. Annual general meeting at the Grand Hotel. Tea at 6.15 p.m.

Institution of Electrical Engineers: Leeds Section.

7.15 p.m. Annual general meeting at the Leeds University. After the election of officers, the following Paper will be read:—"Electrification of Steam-Driven Non-Reversing Rolling Mills," by W. F. Mylan.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. Annual general meeting at 92 Victoria Street, S.W. Paper to be read:—"Some Notes on Relays," by E. W. Moss.

THURSDAY, MAY 6th.

Institution of Electrical Engineers.

8 p.m. Meeting at the Royal Society of Arts, John Street, Adelphi. Paper to be read:—"The Theory and Application of Motor Converters," by H. S. Hallo.

Röntgen Society.

8.15 p.m. Meeting at 20 Hanover Square, London. Paper to be read:—"An Illustrated Description of the Historical Collection of Tubes Recently Deposited at the Albert and Victoria Museum," by Dr. G. H. Rodman. Mr. H. C. Head will show a new localising apparatus designed by Staff-Surgeon Dr. Gillett. Mr. Rafferty will show and describe a tube with plan for altering the metal of the anti-cathode. A note "On X-rays Produced at a Magnetically Deflected Cathode Focus," will be read by Mr. J. H. Gardiner.

CORRESPONDENCE

TRACK BRAKES.

To the Editor of Electrical Engineering.

Sir,—Mr. Panton has the advantage of me. The Municipal Association's tests of serrated cast-iron blocks included none on greasy rails, and the tests as recorded in their report are all the evidence I have on the subject. The Brakes Committee of the Tramway and Light Railway Association will give careful consideration to any information on track brake blocks which Mr. Panton can afford, and will be very much obliged if he can assist it with tests on the road.

Frood's lining I only alluded to as in use on the London "tubes" and as showing in certain tests a remarkably constant co-efficient of friction. Since my article appeared I hear that a greatly improved waterproof material has been produced by the same firm, and I hope that reliable tests of its properties will be shortly available.

Mr. Panton adopts a somewhat controversial style in criticising an article which was intended as a summary of the published tests and as a justification for further investigation, which I am glad to say will be shortly undertaken.

I will not follow him, but will ask him to communicate with the Committee and assist it to put ascertained facts in the place of somewhat conflicting opinions.

I am, Yours truly,

Henry M. Sayers.

39, Victoria Street, S.W.
April 24th, 1909.

PARALLEL RUNNING OF THREE-PHASE ALTERNATORS WITH EARTHED NEUTRALS.

To the Editor of Electrical Engineering.

Sir,—The article on p. 365 of your issue of April 22nd by "A Dynamo Designer" raises a question of very considerable importance in the working of high-tension three-phase generating stations, a question which, in the early days of three-phase supply, formed the subject of much discussion and difference of opinion. It does not appear that engineers are by any means agreed even yet as to the best way of earthing the neutral, and the third evening devoted to the discussion of Mr. Rider's Paper contained criticisms of his earthing method, and at least one definite suggestion of another method.

It seems clear that the general experience of those responsible for the running of high-tension three-phase generating stations is that, whatever method of earthing the neutral may be adopted for star-wound three-phase generators working in parallel, some objection-

Digitized by Google

able results may and do arise. The discussions of the past have probably been forgotten by the majority, who took no part in them, and it would seem that there is still sufficient diversity of opinion among engineers to warrant further discussion in the technical press.

In a large station like that at Greenwich the cost of the very ingenious piece of apparatus, which has been devised for securing that the centre of the star winding of one generator only shall always be connected to earth, is comparatively a small matter, but in a station of much smaller dimensions an engineer would have to consider very carefully if the expenditure was justified. Your last week's article does not refer to one obvious alternative solution, which is to work without the neutral point earthed at all.

At Park Royal generating station, belonging to the Great Western Railway Co., although each alternator was designed so that the neutral could be earthed if so desired, it never has been earthed when supplying the external circuit, and as far as our present experience goes, no inconvenience has resulted. The generators work at 6,500 volts between phases, and with an unearthed neutral it is clear that, should one phase in the external circuit go to earth, the other two phases will be 6,500 volts above earth. When the machines were specified this condition was pointed out, and the insulation between the conductors and earth was made sufficient. We have had a phase on the switchboard circuit go to earth without interrupting the supply.

It may be possible that the earthing of the neutral does prevent troubles from surges in the feeders due to disturbances at their further ends, and it will be useful to hear what the experience of other stations, which work without the neutral point earthed, has been on this point. As, however, it seems clear that the operation of earthing the neutral introduces, or may introduce, troubles of its own, it appears necessary that each individual case should be weighed upon its merits, and a decision taken accordingly. The article of "A Dynamo Designer" is helpful to anyone having to make this decision, but personally, if it was a choice between altering the wave-form of all the generators in a station to a sine wave (supposing that they were found not to possess a sine wave), and bearing any troubles due to dispensing with the earth-connection altogether, I think there would be very good reasons for adopting the latter course.

Yours faithfully,

Roger T. Smith.

Paddington.
April 26th, 1909.

To the Editor of Electrical Engineering.

Sir,—In your issue of April 22nd "A Dynamo Designer" criticises the use of an automatic switch by Mr. Rider for earthing the neutral point of one of his alternators. The principal ground for the criticism is the extra complication introduced by the use of the switch, which would not be required if the generators had been properly designed, so that higher harmonics would not appear in the E.M.F. wave. It must be admitted, certainly, that the switch is an additional complication, and that its installation involves a considerable expense. Probably the design of the Greenwich alternators is not all that could be desired in respect to the wave-form, as the curves indicate the presence of higher harmonics; but whether it is feasible to design alternators of this type which will work together under all conditions, without circulating currents through the neutral connection, is a questionable point. An interesting article by George I. Rhodes regarding the operation of the Manhattan generators will be found in the *Electric Journal* for July, 1907. But assuming that properly designed alternators would not give circulating currents with the neutrals connected solidly together, it must be remembered that Mr. Rider has machines which do give them, and, in addition, it will soon be necessary to operate his reciprocating sets in parallel with turbo sets made by two different manufacturers. If all these machines had exactly the same wave-form under all conditions of operation, there would, of course, be no circulating currents, but it would seem scarcely advisable to attempt to bring them all into line at this date.

There are thus two questions which arise:—(1) Do the circulating currents reach such a value as to cause any bad effects? and (2) Assuming that bad effects are produced, is there not some more simple way of reducing the circulating currents than by the use of an automatic switch?

(1) The principal objection raised to the presence of the circulating currents is that they increase the heating of the generators, but since these currents have a frequency three times the fundamental, the resultant heating is not equal to the square of the sum of the main and circulating currents, but to the sum of their squares. For example, if the circulating currents have a value of 10 per cent. of the full load current, then the heating at full load is not $(1{\cdot}00+0{\cdot}10)^2=1{\cdot}21$, but $(1{\cdot}00)^2+(0{\cdot}10)^2=1{\cdot}01$, *i.e.*, instead of increasing the heating by 21 per cent., it is increased by only 1 per cent. Similarly, a circulating current of 20 per cent. increases the heating at full load by only 4 per cent., and not 44 per cent. At low outputs the heating effect of the circulating currents need scarcely be considered. In view of the above, it would seem that only in the case of extremely heavy circulating currents would the increase in heating be noticeable, and it is probable that, in the great majority of stations, no harm whatever would result from connecting the neutral points of the alternators solidly together.

(2) Assuming that it is necessary or advisable to eliminate these circulating currents, what other methods are available? Instead of using an automatic switch to ground the neutral of one machine, this may be done by the station attendant. By making certain rules for the paralleling of the alternators, such as, that the last running machine to the left or to the right shall always have its neutral grounded, this method of procedure would soon become a matter of station routine, and even if the attendant left two machines coupled to the neutral bus-bar, or disconnected all the machines, it is not likely the results would be serious. Several large stations are now operating in this manner. It would not be a difficult matter to arrange a signalling device which would indicate when the connections are not properly made.

In the discussion of Mr. Rider's Paper last Thursday evening, Mr. Brazil proposed the use of a special form of carbon resistance, connecting a certain resistance between each generator and the neutral bus-bar, and a certain additional amount between the bus-bar and earth. It would be interesting to have further information regarding this resistance, with particulars of its behaviour in case of an earth on one phase with a fairly high setting of the time-limit circuit-breaker. It has also been suggested to place a choke coil between the neutral of each generator and the neutral bus-bar. There would thus be two choke coils in series which would offer high impedance to the high frequency circulating currents. But in parallel they would offer comparatively little impedance to the flow of currents at normal frequency to earth. These choke coils would have a magnetic circuit, which would be very highly saturated by the voltage between neutral and earth, in the event of earth on one phase. A resistance or a choke coil

Digitized by Google

would be connected between the neutral bus-bar and earth. The cost of suitable choke coils for this purpose should not be high, and it affords a very simple method of producing the desired results.

Yours, &c.,
J. S. Peck.

Trafford Park, Manchester.
April 26th, 1909.

[Owing to pressure on our space we are obliged to postpone until our next issue the publication of several interesting letters on the same subject.—Ed. *E.E.*]

THE G.B. SURFACE CONTACT SYSTEM ON THE L.C.C. TRAMWAYS.

To the Editor of Electrical Engineering.

Sir,—We trust you will find an opportunity of making it clear that the copies of Mr. Mordey's reports to the L.C.C. which have been published in the Press have been supplied by us and not by Mr. Mordey. A rumour appears to be current to the effect that Mr. Mordey has disclosed to the Press reports which he had made as expert to the Council. This, of course, is not the case. We are, however, entitled by our agreement with the Council to see and make copies of any such reports, and have a perfectly free hand as far as the publication of them is concerned.

Yours faithfully,
The G. B. Surface Contact Co.
B. H. Bedell, Engineer.

Hamilton House, Bishopsgate Street Without,
London, E.C., April 26th, 1909.

TANTALUM, AND ITS INDUSTRIAL APPLICATIONS

THE Friday evening discourse at the Royal Institution last week was delivered by Mr. Alexander Siemens, whose subject was "Tantalum, and its Industrial Applications." Most of the lecture, however, was devoted to the subject of tantalum as an electric lamp filament. There was room for considerable improvement, the lecturer said, in the methods of light production, as in the most efficient artificial source of light, namely, the arc lamp, only one per cent. of the energy consumed was converted into light. By raising the temperature of the incandescing body, a larger percentage could be converted, and this result was procured in glow lamps by the use of metal instead of carbon filaments. The temperature limit of the carbon filament, namely, that temperature at which it could be run economically, was about 1,600° C. It then consumed 3 to 3·5 watts per candle. Osmium was tried as a substitute for carbon, but it was too expensive; vanadium was tried, but was no improvement on carbon; niobium could be run at a higher temperature; but tantalum, which was first produced pure by Prof. Von Bolton, could be run at a still higher temperature than niobium. The tantalum produced in Moissan's electric furnace contained a small percentage of carbon, and was also probably slightly oxidised, which would account for the brittle nature attributed to it by Moissan.

Tantalum, continued the lecturer, was obtained from ores which were mined in Scandinavia, North America, South-west Africa, and Western Australia. Some of these ores contained niobium, which was very difficult to separate out; but tantalite, which came from the last-named locality, was practically free from niobium, consisting mainly of iron, manganese, and tantalum pentoxide. From this ore the tantalum was separated by a chemical process, and finally precipitated in the form of a black powder. This powder was compressed and then melted into metallic buttons in an electric vacuum furnace. Finally, these buttons were rolled into rods or sheet and stamped into various shaped articles or drawn into wire. This tantalum, which was quite pure, resisted moisture and all acids except fluorides; for this reason it might be employed in certain cases as a substitute for platinum, as, for example, for the electrodes of Röntgen-ray tubes. It could be hardened by slightly oxidising, and pen-nibs of tantalum had been made. The lecturer also exhibited several surgical and dental instruments made of tantalum hardened by slight oxidisation. The heat conductivity of pure tantalum was low, being about three-quarters that of iron and one-eighth that of copper; its tensile strength was high, namely, about 93 kg. per sq. mm. When heated to a dull red heat, tantalum absorbed hydrogen and nitrogen, and became brittle; it also turned colour, becoming yellow first and blue afterwards. In the form of black powder or as a fine wire, it burnt in the bunsen flame to the white pentoxide. The specific weight of tantalum was 16·6, and the specific resistance after it had been heated for a considerable time and had attained a stable state, was 0·146. The temperature-coefficient averaged at 0·29 per cent. per degree Centigrade between the limits of 100° C. and 1,850° C., so that the resistance of a tantalum filament at its normal running temperature was about six times that at 100° C. The specific heat of tantalum, as determined just recently by Sir James Dewar, was 0·033. Prof. Von Bolton's figure in 1905 was 0·036, but the metal was obtained purer now.

The tantalum lamp could be said to date back to July, 1903, when a lamp with a filament 1/20 mm. in diameter and 54 mm. long was constructed. This lamp ran at 9 volts, taking 0·58 amp., and gave an efficiency of 1·5 watts per candle. A lamp for 100 volts would under these conditions give 43 c.p. In 1904, a 100-volt lamp with a filament of the same diameter, but 660 mm. long, was produced; the diameter of the finest filament in use at present was only 1/30 mm. The weight of the filament of a 25-c.p. 100-volt lamp was only 0·022 gms., so that some 45,000 lamps could be made from one kilogram of tantalum. The lecturer showed some curves demonstrating the positive temperature coefficient of tantalum, and the effect of this in relation to the power of the tantalum filament to resist the deteriorating effects of voltage fluctuations. As the resistance went up with increasing temperature, the increase in current was small for a given increase in pressure; this enabled the tantalum filament to withstand momentary high pressures better than the carbon filament. If the filament was oxidised at any part, this part would have a much higher resistance, and would become incandescent before the rest of the filament. Mr. Siemens showed a lamp in which the filament had been purposely spoilt in this way during the process of manufacture, and which glowed much brighter in parts. By running this lamp on an alternating-current circuit for some minutes at a high temperature, the oxygen was expelled from the filament and the bright spots disappeared. In conclusion, Mr. Siemens showed an experiment to demonstrate the valve action of an electrolytic cell with a tantalum anode and a platinum cathode. Directly current flows, a film of high-resistance oxide forms over the surface of the tantalum electrode and the current practically ceases; if, however, the polarity of the cell is reversed, the current flows easily. The action is, of course, the same as that in the aluminium cell. If alternating current is applied to the cell, only the one half of the E.M.F. wave sends current through.

THE INSTITUTION OF MINING ELECTRICAL ENGINEERS

AT a meeting held in Manchester on Saturday, Mr. W. Maurice, general manager of the Hucknall Colliery Co., Ltd., was elected President of the new Institution of Mining Electrical Engineers, and a committee was formed. Mr. Maurice explained the general objects of the Institution in the following short speech:—

We are here to-day to inaugurate a new association or institution of electrical engineers who are engaged in mining. The colliery electrician of the present day occupies, as a rule, a dubious position. Under the Coal Mines Regulation Act he is nothing more than that vague abstraction called a "competent person." On the colliery staff he is nearly always subordinate to the enginewright, and is often enough regarded by the enginewright as inferior in point of ability and general usefulness to a fitter, a blacksmith, or a carpenter. He has responsible duties, but no recognised position, and is generally regarded as the servant of everyone who uses—or perhaps it were more accurate to say misuses—the apparatus which is under his care.

All this, of course, is but a passing phase in the evolution of a new type of mining official. The mining electrician, the importance and responsibility of whose duties is increasing by leaps and bounds, is coming into his own, and it is to aid him and to steer his advance in the direction which responsible opinion believes to be the best, that this society comes into being. Herbert Spencer has drawn attention to the curious truth that when an evil is very great it attracts little or no attention; that when, from one or other cause, it is investigated, recognition of it brings efforts to decrease it; and that when it has much diminished there comes a demand that strong measures shall be taken for its extinction. When electrical installations in mines were thoroughly and unmistakably and unpardonably bad, no one took the slightest notice of them. When, by a natural process of development, the bad work began to disappear, it was found urgently necessary to formulate rules for the purpose of effecting a cure. And presently, no doubt, when the management of electric mining plant is securely established on a scientifically organised basis, we shall have a demand for strong measures of what politicians are pleased to call "reform."

Digitized by Google

In the Spencerian sequence we are now proposing to support and extend the Governmental efforts to improve the condition of electric mining by the special individual and collective study of mining conditions. Now is the psychological moment for the establishment of a society of mining electricians—a society which shall devote itself solely to the assistance of its members and to the interchange and distribution of their technical experience, as well for their individual advancement as for the welfare of the great industry they serve. If members will but contribute generously out of their stores of practical knowledge, they will provide valuable means for increasing the safety of mining, help for those less experienced than themselves, and form the nucleus of a mass of evidence, possibly of great importance, against the time when the demand comes for more restrictions.

It seems to me as I speak that colliery owners might do worse than offer prizes annually through this society for the best Papers on, say, safety in coal-cutting, or the care of cables underground, or any other of the thousand and one problems which, while technically interesting to engineers, are of considerable commercial importance to those who have to do with the administration of mines. The electrician must keep the fact well in view that he is working for the manager, although it may be—in the case of very large concerns—through a chief engineer that he must find his way.

Without further preface I commend Mr. Williams' happy idea to your consideration, and if it meets with your approval, ask you to proceed with the necessary formalities.

Mr. J. Williams, the Hon. Secretary and Treasurer (*pro tem.*), then gave a more detailed statement of what would be the work of the Institution and of the objects to which its activities would chiefly be directed. The name of the Institution will be the "Institution of Mining Electrical Engineers," and all colliery managers and any engineers connected with mining or electrical work will be eligible as members, including consulting electrical engineers and manufacturers. Eventually there will be a class of certificated members consisting of those who are qualified by their knowledge and experience to take charge of the electrical plant in collieries and other mines, and the question of instituting examinations and issuing such certificates will be considered by the Council in due course. Meetings at various mining centres will be held for the discussion of Papers, and the following members will act as local representatives and the preliminary committee of the Institution:—

SCOTLAND.—J. E. Sayers, 157 West George Street, Glasgow.
NORTHUMBERLAND AND DURHAM.—H. J. Fisher, Burn House, Shiney Row, Fence Houses, Durham.
CUMBERLAND.—J. Williams, 3 Moresby Parks, Whitehaven.
YORKSHIRE.—R. J. Frost, 8 Makin Street, Mexboro', near Rotherham.
LANCASHIRE.—P. D. Coates, 55 Ennismore Street, Burnley.
DERBYSHIRE.—J. Kirkby, The Grange, Pilsley, near Chesterfield.
NOTTINGHAMSHIRE.—H. Cusworth, 45 Edward Street, East Kirkby.
STAFFORDSHIRE.—S. H. Bell, 9 Bank Street, Cheadle.
NORTH WALES.—J. A. Boshes, 1 Castle Road, Chirk, Ruabon.
SOUTH WALES.—E. Ivor Davies, Rock Cliffe, near Llandebie, R.S.O., Carmarthen.
SOUTH OF ENGLAND.—H. J. F. Stewart, Hospital Road, Ilfracombe.

A regular Council will be elected in about three months' time.

There is also to be a class of Associates, consisting of assistant electrical engineers and electricians. The subscription will be one guinea for members, and half a guinea for associates.

Arrangements will be made for the prompt publication of the Papers read at the meetings and of reports on the discussions, and these will be sent out to all members.

It was announced that thirty members had already definitely joined the Institution, about one hundred had sent enquiries, and apparently there is a good prospect of having a membership of some hundreds during the next few weeks. Twenty more members were enrolled at the meeting. There have also been several offers of good Papers.

A brief discussion served to clear up any doubts as to the objects of the Institution. One speaker was very emphatic on the point that no new Institution was necessary, and that the members should rather join the local sections of the Institution of Electrical Engineers. It was explained, however, that the Institution of Mining Electrical Engineers will be primarily for the benefit of engineers in charge of electrical plant in mines, for improving their status and widening their knowledge by the exchange of experience and ideas, and that its scope differs from that of the Institution of Electrical Engineers or any of the existing mining institutions.

Intending members should send in their names to Mr. J. Williams, the Hon. Secretary and Treasurer, 3, Moresby Parks, Whitehaven.

THE POST OFFICE, TELEPHONES AND WIRELESS TELEGRAPHY

The Postmaster-General's Annual Statement

IN the House of Commons on Tuesday afternoon, Mr. Sydney Buxton, the Postmaster-General, made his annual statement as to the business of the Post Office, and in the course of his speech he made it clear that the Post Office would be by no means averse from arriving at an arrangement with the National Telephone Co., if it could be done, by which the company's business should be taken over by the Post Office in the near future, instead of awaiting the expiry of the company's licence on December 31st, 1911.

The telephone had, he said, largely cut into the telegraph service, particularly for the most profitable class of service, namely, short messages, and had also taken away business from the penny post. The telephone branch of the Post Office showed a very fair increase in revenue. The service had expanded considerably during the year; they had opened 102 new exchanges, 55 call offices in connection with trunk wires, and 130 other call offices. Though the smaller offices yielded no profits in the initial stages, they would expand and become profitable in the future. He was very anxious that the construction work of the National Telephone Co. should be continued uninterruptedly until the end of their lease, as the system should be taken over in a complete and efficient state, and further, he did not wish the construction staff to be dispersed or even temporarily dismissed. In preparing for the change-over, they had done underground and overhead work for the company amounting to about one million pounds already, Small exchanges had also been placed at once on Post Office premises. A departmental committee had already surveyed the plant in certain towns with a view to its rapid valuation and also to ante-dating, if necessary, the time at which the arbitration might be brought into force. Agreements had been made with regard to the constructional work that would not involve replacement.

Mr. Buxton thought there had been considerable exaggeration with regard to the possibility of extensive dismissals by the National Telephone Co.; the Company were not refusing the ordinary everyday offers of new lines, and would have a large amount of work going on up to the end of their existence. Again, vacancies in the maintenance staff were being filled up by the construction staff. He was of the opinion, however, that the best solution of the question would be an earlier purchase by the Post Office of the National Telephone Co.'s undertaking; he had already raised the question with the Company. The purchase could only be carried out on the lines of the agreement of 1881, but the Post Office would be prepared to meet the Company in regard to the goodwill and profits lost for the two or three years involved.

With respect to wireless telegraphy, Mr. Buxton stated that considerable progress was being made in this direction. The Radiotelegraphic Convention, far from being harmful to the progress of wireless telegraphy and to the Marconi Co., had been to their benefit. The Marconi Co. had loyally co-operated in regard to accepting messages from any other system, and it was interesting to note that while the Company had only 18 stations on German ships at the time the Convention came into force, they now had 36 stations. Mr. Buxton stated that the Government had taken warning by the telegraph and telephone systems, in which the State had allowed a monopoly to grow up which they had subsequently to buy out. The licences issued would come to an end in 1912, and the Government would then have to decide whether they would take over the whole system, or whether they would renew the licences of the various companies.

In the course of the discussion following the statement, Mr. Buxton said that they hoped to make a substantial reduction in the telephone rates to France, and again expressed the opinion that the best solution of the position of the National Telephone Co.'s construction staff would be to ante-date the time of purchase.

The vote to complete the sum of £18,977,930 for the salaries and expenses of the Post Office was then agreed to.

NEW 3,200 K.V.A. TURBO-ALTERNATOR AT THE ASTON MANOR ELECTRICITY WORKS

THE electricity works of the Aston Manor Corporation have been recently extended by the addition of a new turbine-driven set supplied by the General Electric Co., in conjunction with Messrs. Belliss & Morcom. The output of this set is 3,200 K.V.A. when working with a power factor of 80 per cent. The frequency is 50 cycles, and the pressure varies between 6,400 and 6,600 volts. The set runs at 1,500 r.p.m.

This is the first alternator installed by the Corporation, and is intended for the supply of current to the outlying districts. The power generated is partly used as three-phase current for lighting and power, and partly converted into continuous current by means of motor generators and rotary converters. The extension of the station has been arranged in such a way that a second set of similar output and size can be put down side by side with the present set.

As will be seen from Fig. 1, the generator is of the rotating magnet type, with stationary armature. The frame is of the semi-enclosed pattern, and ample provision is made for ventilation of the rotating portion, as well as of the core, the distance between adjacent ducts being approximately two inches. The laminations are of "stalloy" steel, and in order to minimise the losses, the plates have been annealed after punching. As the armature is very long, the plates are separated at short intervals by means of sheets of presspahn, besides the ordinary insulation on each lamination, to prevent the formation of eddy currents. The plates are assembled into the casing and clamped together in short sections by means of bolts passing through holes punched in the plates. After the whole length of the core has been built up in this way, the cast-iron end plates are locked in position and the bolts are then withdrawn. This reduces the iron losses very considerably, as there are no solid rods passing through the stampings.

The stator winding is made up of solid copper bars, assembled in groups insulated from one another by six layers of varnished cotton tape. The micanite insulation is moulded round each group of bars belonging to one slot, the bars being then pushed through the slots from one end, and locked in by maple wedges. Before the end connections are fixed to the bars, these are tested with four times the working voltage between each group of bars and earth. The end connections are also made of copper bars bent to a suitable shape, and arranged in two layers. The insulation between each is the same as that in the slot—that is, six layers of varnished tape. The end connections are tied solid together, and covered with tape, the different coils and phases being kept apart with wooden blocks. The whole of the connections are rigidly fixed to the end plates of the core by means of heavy bolts and steel clamps, which are insulated with micanite. The straight parts of the bars which project from the core are also secured and kept apart by wooden blocks, which prevents any movement of the winding under the stresses which would be produced by a short circuit. The winding, after completion, was subjected to a test of 13,500 volts for half an hour between different phases, and also between each of the phases and earth.

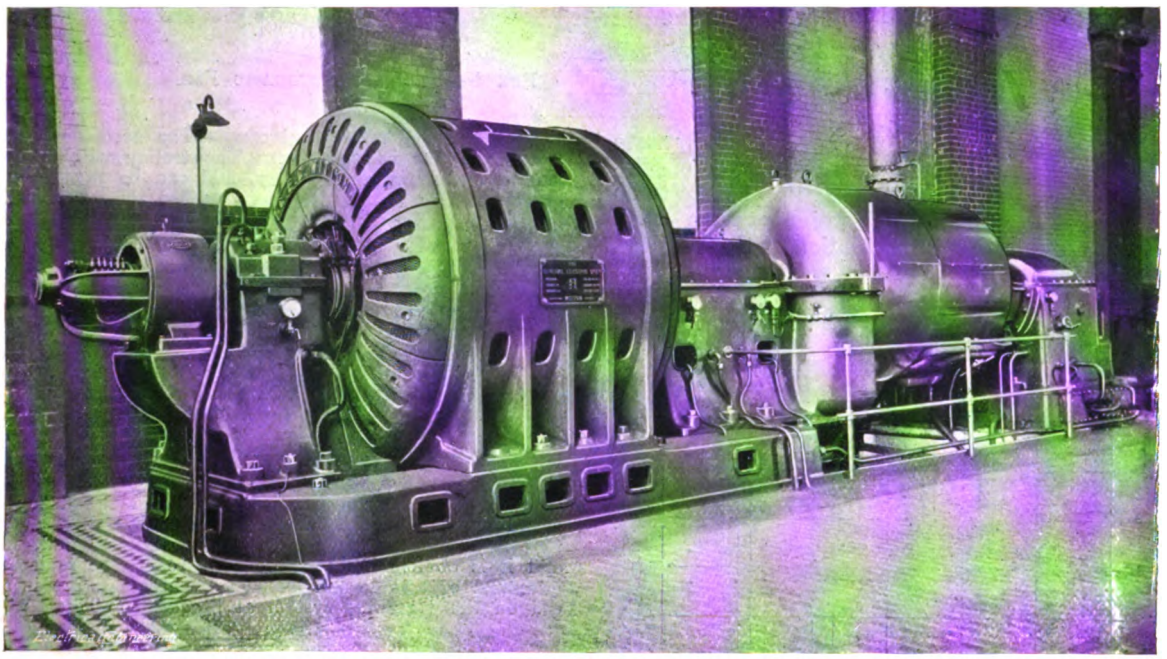

Fig. 1.—3,200 K.V.A. Turbo-alternator in Aston Manor Generating Station.

The ends are brought to high-tension porcelain insulators arranged inside the bedplate, close to the outside bearing of the set.

The rotating field system required most careful design and construction, on account of the extremely high peripheral speed of 17,000 ft. per minute. It consists of a solid block of mild steel, forged in one piece, and extended at the two ends so as to form the shaft. The space required for the winding was machined out of the solid. The winding consists of a coil of copper strip wound on edge, insulated by strips of leatheroid and impregnated paper, and wound tightly on the magnet poles. In order to secure the coils firmly, phosphor-bronze wedges are driven in between the poles, each wedge being held in position by thirteen two-inch nickel-steel screws. The shape of these wedges is such that they allow for circulation of air between the field winding and the inside of the stator stampings. The two ends of the rotor are fitted with manganese bronze caps, shaped in the form of fans, and fitted with dovetailed grooves for the balancing

Digitized by Google

weights. The ends of the field winding are brought to two steel slip-rings shrunk on to a micanite sleeve, and the current is led to these by two sets of laminated copper brushes. The direct-coupled exciter supplies the current at 40 volts; it is of the standard Witton type, and the only unusual feature is the very large commutator which was required, a condition of the specification being that it should be fitted with carbon brushes, notwithstanding the very low voltage. The regulating resistance for the field current is placed underneath the exciter near the condensing plant, and is operated by means of a motor from the switchboard platform. Indicators on the switchboard show when the resistance is all cut-out, or all in, and an automatic switch for cutting-out the motor whenever the arms of the regulator reach the two extreme positions is provided.

The shaft extensions of the rotor run in two bearings supplied by the turbine makers, the one facing the turbine being enclosed in a large cast-iron casting, which also encloses the turbine bearing and the coupling. The bearings are fitted with forced lubrication.

Before erection the rotor was balanced both statically and dynamically. For this purpose it was made to rotate in a set of bearings mounted on rollers, the oscillation of the bearings being taken up by suitable rubber buffers. The balancing weights were then adjusted until no vibration or oscillation of the bearings could be observed. Only 17 ozs. of weight were added

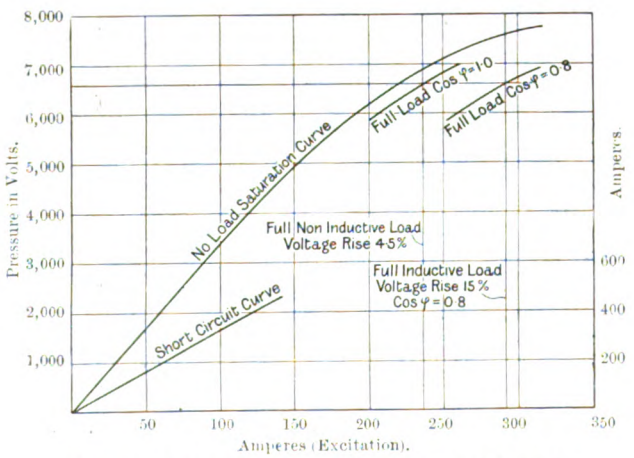

Fig. 2.—Characteristic Curves of 3,200-K.V.A. Turbo-Alternator.

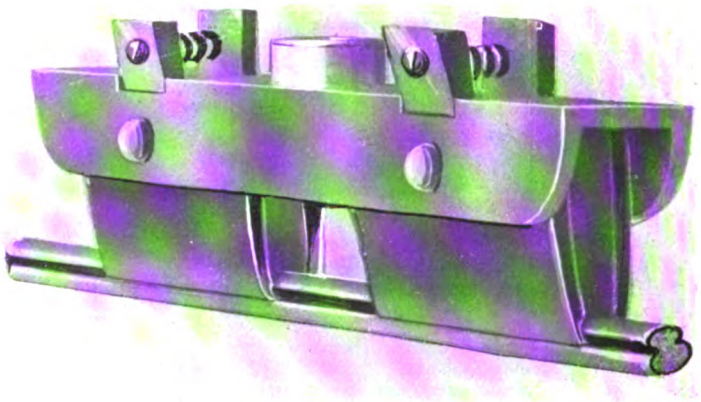
to the rotor when it was tested on these bearings, and nothing more was required when it was coupled up to the turbine.

The curves of Fig. 2 show the characteristics of this machine. It will be noticed that the voltage regulation is excellent, as the voltage rises only 4·5 per cent. when full non-inductive load is thrown off, and only 15 per cent. with full inductive load and 80 per cent. power factor. The machine is capable of an overload of 25 per cent. for two hours, and 50 per cent. for half an hour, without giving rise to injurious heating.

Institution of Electrical Engineers.—An extra meeting will be held on May 13th, when the following Paper will be read:—"Economics of Medium Size Power Stations: A Study of Comparisons between Steam, Gas, and Oil Engines," by A. J. J. Pfeiffer, of the Calcutta Tramways Co.

A NEW MECHANICAL TROLLEY WIRE EAR

A NEW design of trolley wire ear has been introduced by Messrs. Imeson Brothers, Finch & Co., of Stockton-on-Tees, under the name of the "I. B. F." automatic ear, for which great advantages are claimed, both over the ordinary soldered



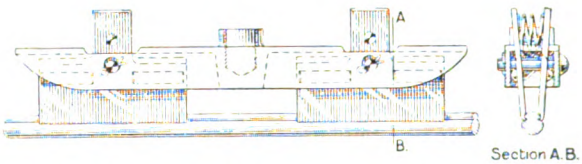


Fig. 1.—"I.B.F." Automatic Ear.

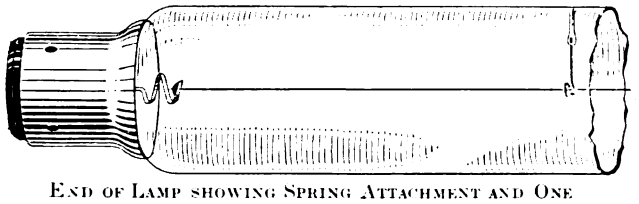
ear and screwed mechanical ears. The accompanying illustrations show the construction. The trolley wire is held by a pair of powerful spring clips, and can be placed in position or released by simply pressing together the upper ends of the jaws. The illustrations show the ear as applied to grooved

Elevation and Section of Automatic Ear.

wire, but the same arrangement is also adapted for use with round wire. The absence of screws enables a great saving of time to be effected, both in case of breakdowns and in erection, and it is obvious that the trolley wire can be replaced with a minimum of trouble and expense. These ears are in successful use on the tramway system at Stockton-on-Tees.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Members: B. Price, W. R. Wright. Associate Members: H. A. Brimelow, G. Broadhurst, C. E. Brotherton, W. A. Brown, A. G. Cuthbert, M. McC. Hoey, A. Imeson, A. C. Jennings, J. Leadbeater, F. B. Leonard, L. H. Marlor, F. D. Napier, C. E. F. Parker, P. S. Pitt, T. S. Shenton, W. S. Stafford, H. Van Dieman. Associates: Lieut. B. C. Battye, R.E., G. C. Lloyd, G. W. Flynn, J. B. Hartley, J. Mould, P. C. Organ, W. A. A. Page, Brij Lal Pasricha, F. H. Stott.



New Tramway Bye-law.—The following communication has been sent by the Commissioner of Police to all tramway authorities within the Metropolitan police area:—"I am directed by the Commissioner of Police of the Metropolis to request that, in view of the increasing number of accidents caused by disabled tramcars being pushed by other cars, you will issue instructions for the practice to be discontinued, and in all cases where it is desired to remove disabled cars that they should be towed instead of pushed. It is not, however, necessary to prohibit the present practice by which one car pushes another for a few feet off dead points such as occur occasionally with the conduit system. I am further to ask that definite instructions be given that cars are not to be driven from the rear end." This new bye-law is the result of the recent fatal accident in the Archway Road, Highgate, when a boy was killed whilst a car belonging to the Metropolitan Electric Tramways, Ltd., was being driven backwards owing to the forward controller being out of order.

THE "TUBOLITE" METAL FILAMENT LAMP

A METAL filament lamp unit, for use in the well-known "Tubolite" fittings, manufactured by the Tubolite Co., of 25, Victoria Street, Westminster, is now on the market.

The tungsten filament is of the Edison and Swan Co.'s make, and is similar to that employed in their "Metfil" lamps. A straight length of about seven inches is fixed in the tubular lamp in the manner illustrated in the accompanying figure, which shows one end of the lamp and one of the two intermediate supports. The lamp is rated at 12 c.p., 25 volts, and,

End of Lamp showing Spring Attachment and One Intermediate Support. (Full Size.)

according to the average of a large number of tests made by the National Physical Laboratory, consumes 1·45 watts per candle, this consumption remaining constant throughout the whole life of the lamp, which, as far as is known at present, extends to 1,000 hours. If the efficiency is measured in front of the reflector it works out to less than 1 watt per candle.

It will be remembered that the carbon filament of the "Tubolite" lamp had a curled portion in the centre to allow for expansion and contraction. It was found impracticable to arrange a metal filament in this manner, as it was too soft when glowing to retain its form. To take up the expansion of the filament, therefore, and to prevent it from becoming too tight on contraction, it is supported at both ends by zig-zag springs of strip metal, as shown in the figure. The filament passes through a small hole in the end of the spring, and is fixed to it, as shown, by a small blob of cement. Although these springs prevent undue tension on the filament, they do not take up the whole of the expansion, and the filament sags somewhat; the two supports fixed to the wall of the lamp prevent it touching the glass, however.

These lamps are of the standard pattern and can be substituted for the carbon lamps by re-connecting the "Tubolite" troughs for series running or by changing the pressure of the circuit. It will be remembered that the aluminium troughs are provided with porcelain bridge pieces which contain a socket on either side. The contact pieces in these two sockets are electrically connected, and for parallel running form either the positive or negative terminals for the two adjacent lamps. For series running, all that is necessary is to disconnect all these bridge pieces and to connect at the two extreme ends only. Thus, for a 100-volt circuit a four-lamp trough would be connected to the circuit at each end only. Lamps for series running are marked "Series U.R.," or with other two letters, and only similarly marked lamps may be run in series. In general, the company recommends parallel running at 25 volts, however.

We are informed that two hundred of the new lamps have been running since December last on a 25-volt circuit in the Civil Service Stores, Bedford Street, Strand, and have given every satisfaction.

The list price of the lamp is *5s. 5d.*; but even at this high price it would be more economical to use them than to use the carbon filament lamps if the life of the metal filament lamp were only 430 hours. This is including the cost of renewals and assuming a charge of about *5d.* per unit for current.

NOTES ON THE LAYING OF DRY CORE TELEPHONE CABLES

AT a meeting of the Birmingham Section of the Institution of Electrical Engineers last week, Mr. F. G. C. Baldwin, of the National Telephone Co., read a Paper on the laying and jointing of dry-core telephone cables. The cables are drawn into conduits, as repairs, renewals, inspections, &c., are then easier than with the solid system. The remarks which follow refer chiefly to the type of metallic circuit cable used for subscribers' lines and short local circuits.

Included in the Paper is a table extracted from the National Telephone Company's specification for dry-core cables with 10-lb. conductors, giving details of the number of pairs in the core and several layers. In drawing cables into ducts, hand-hauling is restricted to short lengths of small cables; pulley-blocks and chain or rope tackle are used in special cases only; and a manually-operated winch is most commonly used, and has proved its superiority for general work. As far as is known to the author, no power-driven winch has been adopted in this country, which is more economical than the manually-operated winch. For large and heavy cables a 4½-in. rope is usually used for hauling. In attaching the cable to the rope or chain, a wire "grip" has been universally adopted, which avoids mutilation and consequent scrapping of the cable end. The grip consists of a woven cylinder of steel wire, interlaced in such a manner that contraction ensues upon the application of tension. In use it is simply slipped over the end of the cable, and tightens up when hauling is commenced. Some preliminary preparation of the end of the cable is necessary, and in some cases where heavy lengths are being dealt with it is advisable to open the end of the cable, and, laying bare the conductors for a few inches, to plumb the solid with the lead sheath. This ensures the tension being equally distributed amongst the conductors, and avoids the possibility of the lead sheath parting. A lubricant in the form of petroleum jelly is usually applied to the cable as it enters the duct. The speed of travel of cables varies from about 3 ft. to 8 ft. per minute. By judicious arrangement it is in many cases possible to deal with cables of small diameter (not exceeding 1½ in.) without cutting or jointing in the maximum lengths in which they can conveniently be manufactured. The cable is first drawn in from a point intermediate between the two extremities of the section—where a break in the conduit line exists—to one end of the section in the ordinary way, after which the remainder is flaked off the drum and laid upon the ground in the form of a figure 8. The free end is then attached to the rope, and hauling proceeds in the opposite direction until the whole has been laid. Lengths of nearly 800 yards have been successfully dealt with in this way and the cost of a joint saved.

Each length of cable after being laid is subjected to a preliminary test for continuity, earths, and short-circuits, and if faulty wires are found to occur in more than one length, they are jointed together, so that the number of faulty circuits in the completed cable is a minimum.

In jointing especially is it necessary to observe cleanliness and to exclude moisture. In large joints where the core is exposed for a period of twenty hours or more, the moisture absorbed by the dielectric from an atmosphere of varying humidity may be considerable unless proper precautions are taken. While jointing is progressing, heat is applied either constantly or at frequent intervals to expel moisture.

After the lead has been stripped off and the wires sufficiently separated, the corresponding wires are tightly twisted together as if in each case a Y joint was being made. The twisted part is then bent back along one of the two wires. The paper is included in the first two twists to prevent it running back. The conductor joint is not soldered. In the case of conductors under 70 lb. per mile, the joint in each wire is insulated by a paper sleeve which has been passed over the end of the wire before the joint is made. Wires of 70 lb. per mile and over are insulated by their own paper covering reserved for the purpose, and secured by a binding of cotton thread.

Wires of the same colours are jointed together, and the joints in the wires are distributed to secure uniform diameter of the completed joint. The wires should be only moderately taut. After a thorough drying the joint is served with a binding of dry cotton tape without overlap, and immediately afterwards the plumbing is executed, 6 lb. sheet lead, or preferably an unseamed sleeve, being used. A brass nozzle with screwed cap and leather washer is permanently plumbed into the sleeve, and by connection thereto of a flexible tube air, dried by passage through a small portable desiccator, is forced into the joint by

Digitized by Google

means of a hand-pump. A defect in the plumbing is shown by the continued appearance of air-bubbles on the application of soapy water.

The introduction of crosses is guarded against by proving each pair as jointed. Before commencing the first joint the extreme end of the first length of cable is opened and the individual pairs are connected together and insulated. The continuity of each pair is proved at every joint during the process of jointing by means of a battery and galvanometer.

Every completed section is subjected to a test for crossed pairs

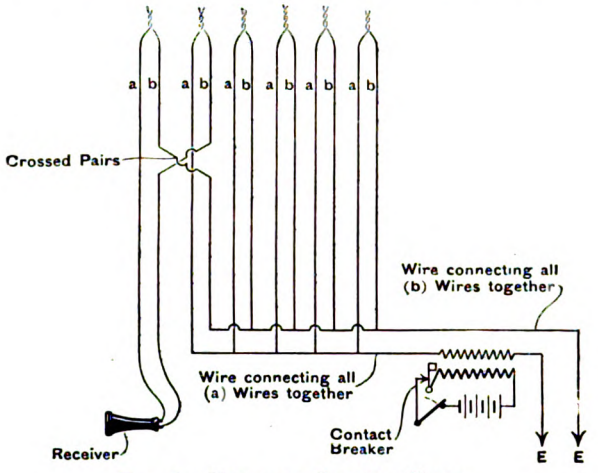

Fig. 1.—Test for Crossed Pairs.

which may have escaped notice during the loop tests made at each joint. The test is diagrammatically illustrated in Fig. 1, and consists in sending round the whole of the pairs connected in parallel an interrupted current, each pair being taken one at a time and connected to a telephone receiver. In the diagram it is assumed that a cross exists, and if the circuit be traced it will be apparent that a hum will be heard in the receiver. Any such pairs which may be found are labelled accordingly. When

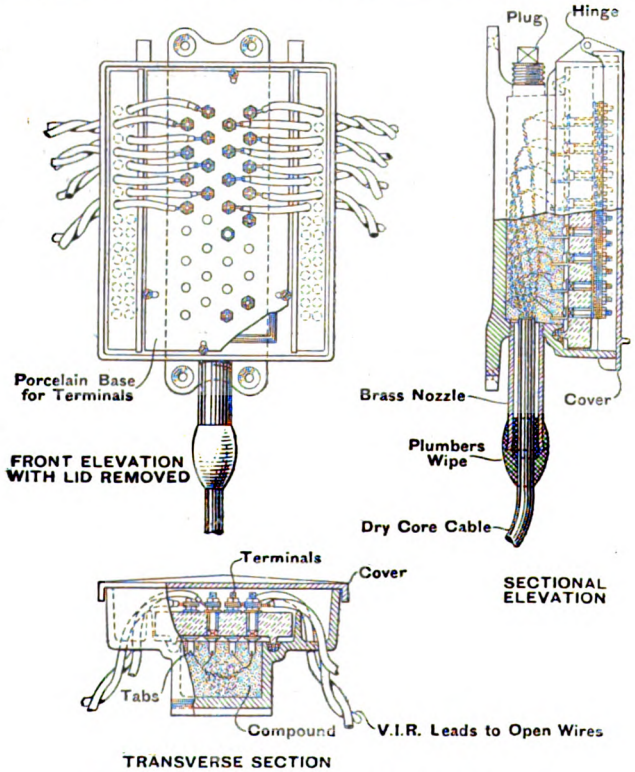

Fig. 2.—Cable Terminal—W. E. Type 14.

the whole of the faulty wires have been detected, it is decided whether the faults are to be located and cleared at once or left for attention as suitable opportunity occurs.

Three typical methods of terminating dry-core cables were next described in the Paper. A cable-head, designed by Mr. S. P. Grace, of Pittsburgh, and made by the Western Electric Company for external use, is illustrated in Fig. 2. It consists of a cast-iron chamber with suitable lugs for attachment to its support and a cast-iron lid hinged at the top. In a recess in the box there is fitted a porcelain block, through which brass pins extend, provided in the inside with soldering tabs and on the outside with screwed nuts and washers. The cable enters through a brass nozzle to which its sheath is plumbed, and the wires are soldered to their respective tabs. The rear compartment is subsequently filled with molten insulating compound through a hole at the top, which is afterwards sealed by a screwed plug. Connection to the external circuit is made by rubber insulated leaders as shown.

The second method described was the "pot-head," in which the cable is sealed by jointing its wires to vulcanised india-rubber leaders enclosed in a lead sleeve, to which the cable sheath is ultimately plumbed. This is filled up with a molten compound, which, when set, forms an air-tight plug.

For inside positions the present practice in terminating a cable of over 50 pairs is to joint it to a special length of silk and cotton insulated lead-covered cable. The end of the latter, which is to be connected to the terminal apparatus and will be permanently exposed, is stripped of its sheath for the necessary distance, and the exposed core is immediately well saturated with beeswax. The beeswax should be maintained at a temperature of not less than 200° F., preferably by means of a water-jacketed waxing tank, and the cable should not be withdrawn from the wax until the cessation of bubbling shows that all moisture has been expelled. The joint between silk and cotton and dry-core cables is made in the usual manner except that the wires are left a little looser and that the ends of the joint are packed with dry cotton-wool interposed between the layers. The taping is omitted, and after being thoroughly dried the joint is plumbed. If the respective tests for insulation and plumbing are satisfactory the joint is immediately filled solid with pure paraffin wax. When cold, another insulation test and an air-pressure test are applied.

In this last test, which is desirable for all jointed cables, air which has been chemically dried is applied under pressure to one end of the cable until a pressure of about 12 lb. per square inch is registered by special pressure gauges fitted at its extremities. The air supply is then shut off, both gauges being left connected, and if the pressure does not appreciably drop for, say, ten hours, it is taken that the cable sheath is air-tight

The Paper concludes with a description of the method of desiccating cables to improve their insulation. Atmospheric air, from which all moisture has been extracted by being passed through tubes containing calcium chloride, is forced at a pressure of from 15 lb. to 20 lb. per square inch through the cable of low insulation. The moisture is absorbed by the dry air and expelled along with it at a vent opened in the cable at a suitable point. The National Telephone Company, at its important exchanges, employs a motor-driven air compressor, which supplies air at regulated pressure to a chamber connected to four vertical cast-iron cylinders. The cylinders are connected in series, and the chloride of calcium is distributed within them on perforated brass trays supported at equal intervals by a central rod. Each cylinder is provided at the top with a flanged lid secured by bolts and made air-tight by a rubber washer, and at the bottom with a blow-off cock for drawing off the extracted moisture. The first cylinder is fitted with a lever valve for regulating, and the last cylinder with a gauge for indicating the pressure.

Mr. D. Stuart (National Telephone Co.) was the only contributor to the discussion. He pointed out the great increase in the number of wires contained in a cable of suitable size to be drawn into a 3 in. duct. A few years ago a 100-pair cable was the largest size, but it was now possible to draw a 600-pair cable into a duct of this diameter. The policy adopted by his company in the purchase of these cables was to give the manufacturers as free a hand as possible, and to avoid tying them too closely to a specification. The result of this policy was to encourage enterprise on the manufacturers' part, and to arrive at improvement in the cables, such as reduction of diameter. The composition of the alloy used for the sheathing of the cable was an important consideration, as it was essential to obtain as high a tensile strength as possible to enable the cable to be drawn into the ducts without injury to the sheathing. The tensile strength of lead alloy containing 3 per cent. tin was 3,980 lbs. per sq. in., as against 2,620 lbs. per sq. in. for pure lead, while the hardness of the alloy was 1·2 times as much as that of pure lead. On the other hand, lead was more pliable; the ratio of the number of turns required to produce permanent deformation was 394 : 298, or 1·32. For a sheath of given thickness, lead was cheaper, but for a sheath of given tensile strength the alloy was the more economical. He also made some comparisons between the ordinary cables and the Martin Dieselhorst multiple twin system of laying up.

Large Electric Winding Plant in Belgium.—According to the *Colliery Guardian*, what is claimed will be the most powerful electric winding engine in Belgium, is about to be installed at the No. 1 pit of the collieries of the Société des Charbonnages de Mariemont, of Mariemont, by the Société des Ateliers de Constructions Electriques, of Charleroi. The engine will be equipped with a motor of 1,200 to 1,800-horse-power (500 volts), and will be capable of raising an eight-truck cage, weighing 12½ tons, from a depth of 840 yards, at a speed of about 36 ft. per second.

ELECTRIC TRACTION ON THE LANCASHIRE AND YORKSHIRE RAILWAY

Mr. J. A. F. Aspinall's Presidential Address to the Institution of Mechanical Engineers

MR. J. A. F. ASPINALL (General Manager, Lancashire & Yorkshire Railway) chose as the subject of his Presidential address delivered last Friday to the Institution of Mechanical Engineers, the electrification of railways, and gave a quantity of information relating to the electrically-worked Liverpool-Southport lines of the Lancashire & Yorkshire Railway. Mr. Aspinall, in his preliminary remarks, said that he did not propose to touch on the controversy between different systems. In treating of the general subject of electrification of railways, he emphasised the necessity for considering each case by itself, as the length of haul, the density of the traffic, the necessity or otherwise of express trains, the presence of steam trains, the proximity of signal boxes, the density or scarcity of population at different points of the line, and the continuity of the flow of traffic during those hours which are not "rush hours," and a variety of other circumstances are important factors in the commercial prospects of such an enterprise. Some of the advantages of electrification for local service were high schedule speed, much more frequent service when required, increased acceleration and deceleration, and greater possible train mileage per train per day, increasing the earning capacity of any given quantity of rolling stock and increasing the loading and unloading capacity of existing platforms.

The President then passed on to deal more particularly with the electrified Liverpool-Southport lines, which comprise four miles of four tracks, and 25 miles of double tracks, making a total, if sidings are included, of 70 miles of single track. It was mentioned that on the four-track section at the Liverpool end, all the four tracks, with the necessary station platforms, were fully employed in the days of steam trains, but that although all four had been electrified as a matter of convenience, it has been found possible to carry all the ordinary passenger traffic on two lines, notwithstanding the fact that the frequency of the trains has been more than doubled. The other two lines can thus be used for goods traffic only without interruption from passenger trains. Here the cost of electrifying is a set-off against the necessity for widening and laying additional lines through a most expensive district, which would in time have become necessary if steam working had been continued for passenger trains. During the first year of electrification, and at an early period when the increased service had shown the public the advantage of greater frequency (with the result that 14 per cent. more people were making use of the trains), it was interesting to note that the total weight of the rolling stock moved in a day between 5 a.m. and 12 midnight was 69,160 tons, against 78,393 tons in the days when steam was used. The suburban service on the Liverpool and Southport electric line is considered to be the fastest service of such a character in existence. The stopping trains on the Southport line run 18½ miles, stop 14 times, and do the journey in 37 minutes. The express trains, which are much easier to work, run the same distance in 25 minutes. The trains get into speed very rapidly, and are running at 30 miles an hour in 30 seconds from starting, though this varies with the number of cars.

A comparison of the coal consumption between steam and electric works shows that whereas the six-wheeled coupled tank engines which did this work in 1904 burnt 80 to 100 tons of coal per train mile, the consumption of coal at the power station in 1908 works out to 49 lbs. per train mile. The consumption of current at the train is 49 watt-hours per ton-mile for the express trains, and 112 watt-hours per ton-mile for express and stopping trains, including all shunting work.

After giving some notes on the constructional work, a description was given of the track conductor equipment, which is in accordance with the standard positions agreed on by the Railway Clearing House in 1903 as regards the "third" or outside conductor rail. The central "fourth" or return rail, however, is placed below the level of the running rail instead of 1½ in. above it, as in the London lines, and it is uninsulated and bonded to the track, as there are no shoes on the cars in contact with it. Diagrams accompanied the address, showing by sections the amount of wear experienced on the track and conductor rails, and it was pointed out how much worse is the wear with motor trucks with low centres of gravity than with steam locomotives, especially on curves, notwithstanding the division of the weights of the motive power between a larger number of wheels and better balance. In discussing the arrangement of the cars, Mr. Aspinall expressed his opinion against the multiplicity of side doors and attendants, and said that with large side doors at each end of a 60-foot car, the most crowded cars are always emptied during the rush hours in about 50 seconds at terminal stations, while intermediate stops only require 15 seconds to pick up and set down passengers. When the Liverpool and Southport line was operated by steam, 30 locomotives and 152 carriages with 5,084 seats were required to do the work, this number including the necessary percentage under repairs. The number of vehicles now required upon this length of 18½ miles is 38 motor cars and 53 trailer cars with 5,814 seats.

The President did not attempt to give a detailed description of the plant and equipment, but summed up the special features in connection with the rolling stock as follows:—Direct control of electric equipment on cars, as distinguished from multiple unit control, though multiple unit control has been used to a certain extent with some later cars. Adoption of the automatic vacuum brake, which is the brake in use upon the rest of the railway, but with specially added valves, for releasing the brakes rapidly after application. Carriages of the exceptional width of 10 ft. over all, allowing a considerable area of floor space per passenger.

Mr. Aspinall spoke very highly of the large main controllers used in the original equipments, which require to deal with currents up to 2,400 amperes.

After a few remarks on brakes, cables, and other items, the address dealt with the battery plant which was installed after some experience had been obtained with the working of the line. The railway was originally equipped with a power station containing five generators, four of 1,500 kw., and one of 750 kw. capacity; four sub-stations, three equipped with four 600-kw. rotaries, and one with three 600-kw. rotaries. The number of trains in traffic was twelve, each being equipped with motors rated at 1,200 h.p., and taking a maximum power during acceleration of 1,000 to 1,200 kw. To meet these heavy peaks it was necessary to run 5,250 kw. of power-house plant, though the average load was only 3,500 kw. The fluctuations of load were so great that at times the engines would entirely cease to take steam, a vacuum being actually produced in h.p. cylinders; within a few seconds the load would rise to 4,000 or 5,000 kw., and superheated steam would be admitted to the cooled h.p. cylinders. This not only led to uneconomical working, but produced severe stresses in the engines, and it became obvious that the repair bill would be heavy unless something were done to steady the load. It may be asked, he continued, why the policy of combined rotary and battery stations was not followed, which would doubtless have been done in the case of a railway such as the London Tubes. It would have effected a saving in wages and made it possible to have the load more uniform still at the power station. About the time it was decided to introduce the battery sub-stations, the traffic had considerably increased, and the lighting at certain points was not all that could be desired. Also power was required at Liverpool, and the drop in potential at the train was becoming too great. It was therefore decided to place the battery sub-stations at points intermediate to the rotary sub-stations, as this would enable the conditions mentioned above to be met and improved. Four battery stations, aggregating 5,200 ampere-hours, were accordingly established in 1905, and a further 1,000 ampere-hour station was subsequently equipped in connection with the Aintree extension, and the results, said Mr. Aspinall, had amply justified the policy that was adopted. The momentary peaks in the load were reduced from a maximum of 7,000 kw. to 4,500 kw., and the hourly peak during the rush hours was reduced from 3,800 kw. to 3,100 kw., enabling the load to be carried during the winter with 4,500 kw. of plant, and during the summer with 3,750 kw. of plant. The batteries have a guaranteed efficiency of 85 per cent. in ampere-hours and 75 per cent. in watt-hours. Tests made in 1907 showed that 14 per cent. of the total rotary sub-station direct-current output passed through the batteries, the total loss due to the batteries being about 3·5 per cent. of the rotary sub-station output. In addition to fulfilling the purposes for which they were originally installed, the batteries have proved a valuable standby in cases where one or more rotary sub-stations have been temporarily disabled, and also for running special trains during hours of shut down. The coal consumption was reduced by 8·5 per cent.,

Digitized by Google

and the consumption for train services became 0·412 lb. per ton-mile.

Careful tests have shown an overall efficiency of transmission of 89·7 and further losses from the substations to the cars bring the total efficiency from alternating-current bus-bars to circuit breakers on the trains down to about 81 per cent. The coal burned at the power house per unit delivered to the third rail in 1908 averaged 3·28 lbs. The working expenses of the service work out at 9·5d. per train-mile, including "works costs" for the power-house, sub-stations, battery stations, "operating costs" for motor and electrical equipment repairs, car repairs, guards' and motormen's wages, lighting and heating of cars, repairs of third and fourth rails, bonds and cables, and all working stores. The cost per car-mile varies between 2·75d. and 3d., according to the number of cars run. The total current producing charges, including conversion at sub-station, the cost of battery stations, and depreciation of batteries, absorbs 4·52d. With the exception of the depreciation of batteries, no sum is included for depreciation of plant, or for interest on outlay. The above figures are not intended to, and do not, include any part of the cost of maintaining the running track, the passenger and goods stations, or costs for the platform staff, or any other items required for the railway, whether worked as a steam line or as an electric line.

The great economy, continued Mr. Aspinall, to be hoped for in the future for electrical railways, where no water power is available, is in the production of electricity in very large quantities, the total current producing charges indicated above forming so large a proportion of the total operating cost. The other directions in which economies may be sought for in future designs are mainly in such improvements in the motors as will lead to less repairs, and a very careful consideration of the whole design of the motor track, with a view to giving those large bearing surfaces at every point where the locomotive experiences of many years have shown them to be necessary. The first cost of the locomotive part of the motor-car (omitting the carriage), is about equal the cost of one locomotive. Therefore the two motor-cars cost twice as much as one locomotive. The cost of the annual maintenance of one motor-car is more than the cost of maintaining a locomotive. But the average miles run per annum per locomotive are 20,000, whereas the electric motor-car will run 50,000. The general result is that the cost per train-mile run becomes less for the electric motor-car, and less again per motor-car mile, if each motor-car is looked upon as a separate locomotive.

In conclusion, Mr. Aspinall said that his experience had convinced him that there were a number of suburban lines round our great cities, and especially near London, which could be electrified with advantage to the public and to the railway companies, though we must wait awhile before dealing with long distance travelling.

AMENDMENT OF ELECTRIC LIGHTING ACTS

THE House of Lords considered in committee on Tuesday the Electric Lighting Acts (Amendment) Bill, the text of which was given on page 263 of our issue for March 18th.

Lord Balfour of Burleigh moved an addition to Clause I, which relates to the compulsory acquisition of land for the erection of generating stations. The object of the addition was to prevent generating stations being erected on lands not scheduled in a special act or provisional order, without the consent of the Board of Trade. Upon any such application being made to the Board of Trade, notice would be given to owners and lessees of land situated within 300 yards of the proposed site, and an opportunity given them of stating their objections, if any. The Board of Trade accepted this addition.

With regard to Clause 12, which gives the Board of Trade power to compel electric supply companies to comply with recommendations of the auditor appointed by the Board of Trade, Lord Avebury wished to make this provision also applicable to municipalities, especially, he said, as there was a strong feeling in the country that local authorities were not making sufficient provision for depreciation and reserve in relation to their electrical undertakings. The Board of Trade refused to accept this amendment, and it was withdrawn on an assurance that the matter will be considered before the next stage of the Bill is reached.

An amendment to Clause 21 was moved by Lord Balfour of Burleigh, but was also withdrawn on the assurance that the Board of Trade would give the matter consideration. The amendment in question was to place upon the undertakers, in the event of a railway company desiring to carry out improvements on bridges, the expense of making any necessary alterations to their mains. Lord Clifford of Chudleigh moved an amendment bearing on the same point in order to bring county and non-county roads under this provision. This latter amendment was passed, although not accepted on behalf of the Government, and the Bill was then reported to the House for third reading.

STANDARDISATION OF STEAM ENGINES

THE Engineering Standards Committee have just issued a report on reciprocating steam engines for electrical purposes, which is intended to assist engineers and makers of steam engines for electrical purposes towards mutual understanding. Clauses are included containing information to be supplied to the maker by the purchaser, to be supplied to the purchaser by the maker, and the information which, if specially desired by the maker, should be supplied by the prospective buyer. It also contains the committee's recommendations as to governing, cyclic variation, highest economy, maximum load steam and exhaust pressures, &c. The steam pressures specified as standard are 100, 150, 200, and 300 lbs. per sq. in., and these are defined as low pressure, intermediate pressure, high pressure, and extra high pressure respectively. The following exhaust pressures are recognised as standard :—15 lbs. per sq. in abs. (non-condensing), 2·5 lbs. per sq. in. ("medium" vacuum), and 1·5 lbs. per sq. in. ("good" vacuum). A table of standard speeds for various outputs from 30 to 1,000 kw. is given, containing a single standard speed from 30 to 80 kw., and the standard speeds from 100 kw. to 1,000 kw. Thus a 50-kw. machine is to run at 575 r.p.m., a 100-kw. machine at 107, 250, or 500 r.p.m., and a 1,000-kw. machine at 83, 138, or 250 r.p.m. The clauses on cyclic speed variation and governing are given below :—

The maximum permissible variation in speed of the generator, when direct coupled to a steam engine, throughout one revolution, that is to say, in the amount the rotating part forges ahead plus the amount it lags behind the position of uniform rotation, shall not exceed $\frac{1}{50}$th of the angle between two poles, *i.e.*, the angular variation shall not exceed :—6° in a two-pole machine, 1·2° in a ten-pole machine, and so on. The maximum temporary increase or reduction in speed, due to suddenly taking off or throwing on the whole load, shall not exceed 10 per cent. of the standard full-load speed, and the continuing alteration in speed shall not exceed 5 per cent. of the standard full-load speed. Also the maximum temporary variation in speed due to the load being varied gradually, or by steps not exceeding 20 per cent. of the rated load, shall not exceed 5 per cent. of the standard full-load speed.

The standard continuous overload capacity is given as 20 per cent.

The following particulars are recommended to be supplied to the manufacturer :—Rated output of generator, in kilowatts. B.H.P. required by the generator when working at its rated output. Revolutions per minute, number of poles and total kinetic energy of rotor or armature at above specified speed. Engine stop-valve steam pressure (by gauge). Engine stop-valve steam temperature in degrees Fahrenheit (if superheated) : (*a*) Maximum; (*b*) average on which guarantees of steam economy are to be based. Exhaust pressure at engine exhaust outlet stated in lbs. per sq. in. absolute pressure. Percentage of rated output of generator at which best steam economy per kilowatt hour (K.W.H.) is to be obtained under the above steam conditions.

Certain other classes of particulars are set forth, which may be supplied if desired, such as whether engine is to be horizontal or vertical, the number of cranks, form of drive, &c. The following particulars are to be supplied by the manufacturer when quoting :—

Steam consumption expressed both in terms of the actual feed, *i.e.*, lbs. per B.H.P. per hour and of the "equivalent feed" (obtained by multiplying the actual feed by the heat supplied to the admission steam, expressed in British Thermal Units per pound of steam, and dividing by 1,000), at the rated output of the generator, at the economical output, and at ¾ and ½ of the rated output of the generator. Mechanical efficiency of engine. Mean pressure referred to the low-pressure cylinder, at the economical load and at the specified speed.

The New German Cable.—The work of laying the new direct cable of the Deutsch-südamerikanische Telegraph Co. between Germany and Brazil is now in progress. Starting at Emden, the cable will touch at Teneriffe, from where connection with the West African coast will be made.

Accumulator Cars on the Prussian State Railways.—There are already a large number of accumulator cars in operation on different sections of the Prussian State Railways, and the results obtained have been very satisfactory. Fifty-seven new double cars of a new pattern (described in Electrical Engineering of Oct. 8th, 1908) were ordered some months ago from the Allgemeine Elektricitäts-Gesellschaft, Siemens-Schuckert-Werke, and the Felten & Guilleaume-Lahmeyerwerke, and some of these cars are already running in the neighbourhood of Berlin. According to the *Elektrotechnischer Anzeiger*, ten of these cars have just been delivered by the last-named of the above companies for service between Frankfurt and Mainz.

Digitized by Google

LOCAL NOTES

BANBRIDGE: *Electric Lighting.*—A tradesman in the district, who has his own electric lighting plant, has been asked by a number of neighbours for a supply. The question of giving the permission of the Council to the erection of the necessary overhead wires has been postponed until the next monthly meeting. A scheme was recently put before the Council for the formation of a private company to supply electricity in Banbridge, but no definite decision has yet been come to.

BATH: *Electric Lighting.*—It is stated that the Bath Electric Lighting Bill, which was promoted in connection with the proposed charges by the Bath Corporation's Electricity Works, by a company to be formed by Mr. Schenk, has been withdrawn. The Electric Lighting Committee recommend that the second deposit, £22,500, should be returned to Mr. Schenk, but that the original deposit of £2,500 should be retained to defray the Corporation's expenses in the matter of proposed sale of the electricity works.

BIRKENHEAD: *Electricity Estimates.*—The Electric Lighting Committee estimate an income for the ensuing year of £20,791, compared with £17,911 in the year just ended. After providing for capital charges and an allowance of £1,000 towards the rates, a credit balance of £1,509 is estimated.

Tramway Estimates.—The Tramways Committee estimate an income of £57,055 for 1909-10, and an expenditure of £585 less than this.

BIRMINGHAM: *Manufacture of Tramcars.*—A deputation from the Birmingham Trades Council waited upon the Tramways Committee last week to urge that the Corporation should construct their own tramway rolling stock. It was argued that the London County Council and the Sheffield, Manchester, Liverpool, and Leicester Corporations make great savings by manufacturing their own stock, and inasmuch as Birmingham was the centre of the carriage building industry the necessary accessories could be obtained there cheaper than anywhere else. The Committee promised that the matter should be considered.

BLACKPOOL: *Electricity Accounts.*—It is stated that gross profits of the Corporation electricity undertaking for the year to March 31st, amounted to £7,300, or about £1,000 more than the estimates.

DEVONPORT: *Corporation and Tramways Company.*—In the King's Bench Division of the High Court last week, the Devonport and District Tramways Co. applied for a rule *nisi* prohibiting the Devonport Corporation from proceeding further with the summonses which have been issued against the company for damages for not running a tramcar service upon the leased lines. (See ELECTRICAL ENGINEERING, April 22nd, p. 378.) It was stated on behalf of the company that the magistrates of Devonport had no power to deal with the information, inasmuch as the matter in dispute was one for arbitration. As there was a clause to this effect in the agreement between the parties, the rule *nisi* applied for was granted.

When the summonses were called before the Devonport magistrates on Friday they were not proceeded with.

EDINBURGH: *Electric Lighting Estimates.*—The estimates of the Electric Lighting Committee for the year ended May 15th, 1910, show an expenditure of £65,560, against £65,900 for the current year, and a revenue of £130,060, against £131,360 for the current year. The balance available for appropriation is estimated at £2,400, after meeting interest and sinking fund charges.

Tramways.—An application has been made for a Provisional Order, authorising the construction of tramways in the Colinton district, and the incorporation of the Colinton Tramways Co. The promoters are Sir Colin George Macrae, Messrs. C. D. Geddes, Ian MacIntyre, G. M. Brown, and C. M. Black, and the capital of the proposed company is £50,000 in £1 shares, with the usual borrowing powers of one-third.

LEEDS: *Tramway Accounts.*—The receipts from the Corporation tramways for the year ended March 31st, 1909, amounted to £342,000, there being a gross balance of £163,677, after meeting working expenses. After meeting capital charges and placing £4,000 to reserve, the sum of £47,556 is transferred to relief of rates, compared with £64,279 last year. The number of passengers carried was 76,215,618, an increase of 481,535 over the previous year.

LONDON: *County Council Tramways.*—It is stated that a petition is being extensively signed by the Paddington ratepayers against the extension of the London County Council tramways from Lock Bridge to Edgware Road. It is contended that in consequence of the steepness of Lock Bridge Hill there would be serious danger to life.

Battersea: "Free" Wiring.—The Lighting Committee report with regard to wiring and fitting premises under the provisions of the L.C.C. (General Powers) Act, 1906, that they have decided (subject to the usual sanction) that for the present this work should be done by contractors on behalf of the Council.

Fulham: Linking Up.—Subject to the other Borough Councils concerned adopting a similar course, the Fulham Council is to contribute towards the expenses of a conference of local authorities in London possessing electricity undertakings, to consider a scheme for linking up existing generating stations.

Poplar: The "G.B." System.—The General Purposes Committee of the Borough Council recommend that no further opposition should be offered to the installation of the overhead trolley system from Burdett Road eastwards to the Stepney Borough boundary, as proposed by the London County Council. (See ELECTRICAL ENGINEERING, April 8th, p. 323.) The General Purposes Committee have further placed the following recommendations before their Council:—"That representations be made to the Local Government Board and the Board of Trade, pointing out the serious loss suffered by London ratepayers owing to the abortive installation of the "G.B." system of electric tramways between Aldgate and Bow Bridge, both by the capital loss and the still greater loss of revenue due to the delay in providing an efficient system of electric traction. That the Local Government Board, in conjunction with the Board of Trade, be urged to institute an inquiry into the circumstances attending the heavy losses occasioned."

St. Pancras: Tramways.—A difference of opinion has arisen between the Borough Council and the London County Council as to the width between the outer rail and curb along the line of route of tramways converted from horse to electric traction. The County Council claimed that the statutory Board of Trade distance of 9 ft. 6 in. does not apply in these circumstances, but the Borough Council hold the opposite view. The Borough Council fear that they themselves will be called upon to carry out the necessary street widenings in their borough in the future, where the width between the rail and curb is not 9 ft. 6 in., and as they wish to have the position cleared up they have decided to submit a case to counsel for his opinion as to their powers and liabilities in this matter.

Woolwich: Electric Wiring.—The Electricity Committee have for some time past been considering the advisability of adopting an assisted wiring scheme, and after full consideration recommend that houses of a rental exceeding £32 per annum should be wired free of charge, the consumer paying a rental per lamp installed per quarter. The price to be charged for electricity to such consumers is 4½d. per unit As a commencement 100 houses are to be fitted in this manner.

MANCHESTER: *Electricity Accounts.*—The accounts of the electricity undertaking for the year to March 31st, show a net surplus of £33,304, and after transferring £12,000 to the relief of rates, the balance of £21,304 has been placed to the credit of renewals account. Although the number of units sold compared with 1907 show an increase of 3½ million, mainly on power supply, there has been a decrease of £17,848 in the income. The Electricity Committee point out that the majority of business premises have now been fitted with metallic filament lamps, with the result that the bills of these consumers have been reduced, on an average, by no less than 40 per cent.

Tram Fares.—As the question of halfpenny tram fares will be dealt with in the next report of the Tramways Committee, a resolution that the Tramways Committee be instructed to report upon this matter, has been withdrawn.

MUSSELBURGH: *Tramways Extension.*—The construction of the four miles extension of the Musselburgh Electric Tramway Co.'s lines from Levenhall to Port Seton has been commenced. The track will be mainly single line with passing places.

OXFORD: *Tramways.*—The recommendation of the Tramways Committee, given in our last issue, namely, that the Council should enter into an agreement with the National Electric Construction Co., for the construction of a combination of the conduit and overhead trolley systems in place of the surface-contact system originally agreed upon, has been adopted by the Corporation. The new agreement provides for the payment of £1,100 per annum, by the company during the period of the lease, namely 42 years.

SALFORD: *Chairman of Electricity Committee.*—Councillor Billington has been elected Chairman of the Electricity Committee in succession to Councillor Barrett, and Councillor Wheatcroft has been appointed Deputy Chairman.

SOUTH AFRICA: *Electrical Equipment of Mines.*—The *South African Export Gazette* states that a large number of electrical installations are now being fitted in Rand mines, and particularly those controlled by Sir George Farrar. The contracts entered into for machinery and equipment during recent weeks, says our contemporary, amount to a very large sum.

SOUTHGATE: *Electric Lighting.*—In connection with the proposal of the Council to transfer their electric lighting Provisional Order to the North Metropolitan Electric Power Supply Co., the local Ratepayers' Association have taken the matter up with a view to showing that the Council would do better to purchase from the power company in bulk and carry out its own distribution. Mr. G. Spencer Hawes, of the firm of consulting engineers, Messrs. May & Hawes, who is a resident in the dis-

Digitized by Google

trict, and a member of the Ratepayers' Association, has placed his services at the disposal of the Association, and has prepared a scheme under which he anticipates a surplus of £500 per annum on an output of 195,000 units, although it is quite possible there may be a loss on the first year.

STAINES: *Tramways.*—The London United Tramways Co. have informed the Council that they do not intend to construct the authorised line from Hounslow to Staines.

STROUD (GLOS.): *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1903.

SWANSEA: *Tramways.*—It has been agreed between the Corporation and the Swansea Improvements & Tramways Co. that the latter shall pay £4,544 towards the cost of street widenings in connection with the reconstruction of the High Street tramways.

WALSALL: *Electricity Extensions.*—At a special meeting of the Town Council on Monday, the proposed expenditure of £35,000 upon new plant and extensions of mains was postponed in consequence of the present capital commitments of the Corporation. The Chairman of the Electricity Committee stated that if the motion to postpone this scheme were passed, the Electricity Committee would resign, as they had submitted the proposal after the most careful and prolonged deliberation. The motion to postpone was, however, adopted by 16 to 13 votes.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

GRIMSBY.—The two Stirling boilers at the Corporation electricity works are to be fitted with superheaters.

LEITH.—The Electrical Engineer is to report with regard to extensions at the electricity works.

LLANDUDNO.—A 300-kw. steam generating set is to be installed at the Council's electricity works at an estimated expenditure of £1,750.

LONDON: *London County Council.*—Tenders are invited for withdrawing about 18 miles of low-tension lead-covered cables, now laid and jointed in stoneware ducts, and relaying and jointing about 15 miles. Particulars from the Clerk to the Council (fee, 2 guineas, returnable), and tenders by May 4th.

NETHERLANDS.—*The Board of Trade Journal* states that the Communal Council of Amerongen have granted to Mr. Wolff de Maarsen a concession for the construction and working of a central electric lighting station.

SOUTH AFRICA.—At the recent meeting of the Rose Deep Mines, Ltd., it was stated that a contract has been entered into with the Rand Mines Power Supply Co. for the electrical equipment of the company's mines, the estimated expenditure upon which is £26,000.

SOUTH AUSTRALIA.—Tenders are invited by the Tramways Trust, until June 22nd, for the supply, delivery, and erection at the power station, Port Adelaide, of (1) boilers, mechanical stokers, economisers, steam and exhaust piping, coal and ash handling plant, &c.; (2) steam turbines, generators, exciters, condensers, air and circulating pumps, switchboards, &c.

TASMANIA.—It is stated that electrical driving is to be installed at the Boulder Tin Mine, Zeehan, Tasmania.

Miscellaneous

FALKIRK.—With a view to hurrying forward the proposed extension of the Falkirk Electric Tramways to Laurieston, the Council have agreed to make certain concessions on the terms which were granted to them under the Tramway Companys' Provisional Order. It has been agreed that the company shall pay no wayleaves until after the expiry of three years from the date of the commencement of the extension. Further, under the Provisional Order, the company had to pay £1,500 to the Town Council for street improvements, but the parties have agreed that this shall be paid in two instalments, one of £750 on the date of commencement of the extension, and the remaining £750 on the commencement of the extension to Grangemouth. These concessions are upon the condition that the Laurieston extension is commenced within three months.

HERTFORD.—Tenders are invited for the supply and fixing of 25 b.h.p. electric motor and gearing. Particulars from the Borough Engineer (fee 3 guineas, returnable), and tenders by May 8th.

LOWESTOFT.—The Corporation invite tenders in connectin with the Kessingland Light Railway Order:—(1) For purchase outright; (2) for a lease with option of purchase; and (3) for a lease only. The total length of track to be constructed is 3½ miles, and facilities will be afforded for running powers over a certain portion of the Lowestoft tramway system. Particulars from the Town Clerk, Town Hall, Lowestoft.

NETHERLANDS.—Negotiations are proceeding between the Communal authorities of Arnhem and of Renkum-Oosterbeek for the establishment of an electric tramway, about eight miles long, to connect the two districts.

SOUTH AUSTRALIA.—The Board of Trade correspondent at Adelaide reports that tenders are invited by the Municipal Tramways Trust, Adelaide, and will be received by the chairman of the Trust up to June 15th, 1909, for the supply, delivery, and erection, at the car depôt, Adelaide, of (1) 50 car bodies; (2) trucks, wheels and axles; (3) motor equipments and car wiring.

SPAIN.—Tenders are invited, says the *Board of Trade Journal*, for the supply of six electric cranes, together with all accessories, for the Almeria docks. Tenders, which must be accompanied by a deposit of 18,916 pesetas (about £670), will be opened at the Junta de Obras del Puerto de Almeria at three p.m. on June 7th. The successful tenderer will be obliged to increase the deposit to 10 per cent. of the accepted contract price.

SWEDEN.—H.M. Consul at Gothenburg, says *The Board of Trade Journal*, reports that tenders are invited for the supply of (1) 75 iron tube masts, and (2) 300 tons iron masts for power transmission, required by the electric station of the Royal Trollhatten Canal and Waterworks. Tenders, addressed to "Electricitetsverken vid Kungl. Tröllhatte Kanal och Vattenverk, Tröllhatten, Sweden," will be received up to April 28th in the case of (1), and up to May 1st in the case of (2). The conditions and drawings may be obtained from the "Ofveringeniören för Electricitetsverken vid Kungl. Tröllhatte Kanal och Vattenverk." Trollhatten. Copies may be seen at the Commercial Intelligence Branch of the Board of Trade.

SWITZERLAND.—The Compagnie du Chemin de Fer Electrique de Lugano à Tesserete, of Tesserete, has been granted an 80 years' concession for the construction and working of a one-metre gauge, single track, electric railway from Lugano to Tesserete. The company undertake, says the *Board of Trade Journal*, to complete the line within two years from the date of commencing work.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON: E.C.—Adaptation of premises at No. 35 Queen Victoria Street, for branch of Capital & Counties Bank. Builders, Sheffield Bros., Downes Park Road, Dalston, N.E.

Factory, St. John Street. Architect, W. H. Woodroffe, 57 Lincoln's Inn, W.C.

S.E.—Mission hall and church, Bannockburn Road, Plumstead. Rev. J. H. Jacques, per S. Houghton, 15 Woodhurst Road, Plumstead.

Sunday school and mission hall, Elibank Road, Eltham. W. H. Smith, 5 Great Winchester Street, London, E.C.

PROVINCES.

BEVERLEY.—Church (£3,000). Architects, Garside & Pennington, Ropergate, Pontefract.

BRIGHTON.—Rebuilding Royal Albion Hotel (£15,000). Architects, Clayton & Black, 10 Prince Albert Street, Brighton.

BIRMINGHAM.—Roman Catholic church school. Rev. M. O'Hagan, 524 Stratford Road, Birmingham.

DUBLIN.—College, Denmark Street. Architects, Ashlin & Coleman, 7 Dawson Street, Dublin.

DUMFRIES.—Isolation hospital. Architects, Hay & Thomson, 10 Bank Street, Dumfries.

Block of offices (£3,000). Architects, Barbour & Bowie, 53 Baccleugh Street, Dumfries.

EXETER.—Extensions to Royal Albert Memorial Lodge (£10,000). Architect, T. Moulding, Southern Bay, Exeter.

LIVERPOOL.—Hospital wing (£15,000). Architects, H. & A. Fry, 18 Hackios Hay.

NOTTINGHAM.—Institute (£5,000). A. E. Lambert, 22 Park Row, Nottingham.

RAWTENSTALL.—Tenders are invited for the wiring and fittings of the tramcar depôt and municipal offices, Bacup Road, Rawtenstall. Particulars from the Borough Electrical Engineer (fee, 1 guinea, returnable), and tenders to the Town Clerk by May 11th.

ST. ALBANS.—Hospital. Architect, F. Mence, Market Place, St. Albans.

SWANSEA.—Glynn Vivian Art Gallery (£8,237). Builders, Lloyd Bros., Argyle Yard, Oystermouth Road, Swansea.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The tender of Messrs. Imeson, Finch, & Co., Stockport, for the supply of two miles of trolley wire, has been accepted. Tenders for a circulating pump have been referred to the electrical engineer.

It was announced at the last meeting of the Corporation that the British Insulated & Helsby Cables, Ltd., whose tender for copper trolley wire had been accepted had since withdrawn it.

The following tenders have been accepted by the Lighting and Tramways Committee:—Stoneware conduits, Messrs. Thomas Wragg & Sons, Swadlincote; wood troughing, Mr. John M'Avoy, Belfast; cast iron pipes, Messrs. Watson, Gow & Co., Glasgow.

LANCASHIRE ELECTRIC POWER CO.—Messrs. Davidson & Co., Ltd., of Belfast, have recently received orders for two 60 in. "Sirocco" induced draft fans for the Radcliffe Power Station of the Lancashire Electric Power Co.

LONDON: *Woolwich.*—The Council has accepted the following tenders in connection with the electricity undertaking:—Strachan & Henshaw, Ltd.: coal-handling plant, £847; Underfeed Stoker Co., Ltd.: fourteen sets of underfeed stokers for Globe Lane, £1,300, four sets of underfeed stokers for Plumstead, £770.

SINGAPORE.—A contract has been placed with Messrs. Siemens Bros.' Dynamo Works, Ltd., for the supply of tantalum lamps at St. Andrew's Cathedral.

SOUTH AFRICA.—The Chloride Electrical Storage Co. are supplying a 550-volt battery and Entz booster to the Table Bay Harbour electricity works. The East Rand Proprietory Mines, Ltd., have placed an order for a 3,000-kw. turbo-generator and surface condensing plant with Messrs. Willans & Robinson, Ltd. The electrical portion of this order is being supplied by Messrs. Dick, Kerr & Co., Ltd.

An order has been placed with Messrs. Davidson & Co., of Belfast, for two induced draft fans, 55 in. in diameter, for the Randfontein Estates & Gold Mining Co.

WEST HAM.—The Council has placed an order with Messrs. Bruce Peebles & Co., at £825, for the conversion of the two 1,200 kilowatt Ferranti alternators from single-phase to two-phase. The Engineer reports that some of the Council's consumers, running plant day and night, desire motors with a lower temperature rise than the contract motors. The Westinghouse Company having agreed to a schedule covering this requirement, it is to be added to the main contract so as to prevent the necessity for purchasing motors out of contract. The contract motors run to a temperature rise of 75–88° F. These are not to exceed 72°. The tender of Chafen & Newman, at £106 10s., for the work in connection with the abstraction of water from the River Lea has been accepted.

PARLIAMENTARY INTELLIGENCE

PROGRESS OF ELECTRICAL BILLS.—The Preston, Chorley, and Horwich Tramways Bill was read a third time and passed in the House of Commons on Wednesday last week. The County of Durham Electric Power Bill has been read a first time in the House of Commons, and referred to the Examiners of Standing Orders.

The application of the London County Council for permission to insert additional provision in their Tramways Bill has been held not to comply with the Standing Orders. The Standing Orders Committee on Tuesday allowed the petitions to be inserted.

The Wallasey Tramways and Improvements Bill and the West Kent Electric Power Bill were read a second time in the House of Lords on Tuesday.

The Watford and Edgware Railway Bill was read a second time in the House of Commons on Monday.

ARTILLERY TELEPHONE EQUIPMENT.—In answer to a question in the House of Commons last week, the Secretary for War, Mr. Haldane, stated that telephone equipments have already been provided for four divisions of field artillery brigades. Equipments are being obtained for the remaining artillery brigades, and heavy batteries of the Field Army. This year's estimates include sums for telephone equipments for the Horse Artillery and the Field Artillery Brigades in South Africa.

THE BRITISH ELECTRIC TRACTION CO.—Mr. P. Curran questioned the President of the Board of Trade in the House of Commons last week in regard to an alleged violation of the agreement entered into between The British Electric Traction Co. and the Jarrow Town Council in 1901, by the company neglecting to construct certain light railways in the contract time. Mr. Churchill replied that the Board of Trade had recently granted an extension for two years for the construction of the lines, but they had no power to compel the company to complete the unconstructed portions.

ELECTRIC AMBULANCES.—The *Times* political notes on Thursday stated that Sir William Collins will shortly introduce into the House of Commons a Bill providing for an electric ambulance service in the County of London, on the lines of that now being worked in the City by the City of London Corporation.

THE ELECTRIC LIGHTING ACTS (AMENDMENT) BILL and the P.M.G.'s annual statement are dealt with on pp. 388 and 394.

APPOINTMENTS AND PERSONAL NOTES

The recommendation of the Marylebone Electric Lighting Committee, given in our last issue, that Mr. A. H. Seabrook, engineer and manager of the West Ham Municipal Electric Supply Undertaking, should be appointed electrical engineer and manager of the Marylebone Electric Supply undertaking at a salary of £800 per annum, has been adopted by the Borough Council. The final choice lay between Mr. Seabrook and Mr. L. L. Robinson, Electrical Engineer to the Hackney Borough Council.

The Electric Light Committee of the Coventry City Council have decided to recommend the appointment of Mr. G. Tough as engineer and manager of the electricity undertaking at a salary of £350 per annum. Mr. Tough was formerly station superintendent, but on the resignation of Mr. J. A. Jeckell of his post as manager, the former was placed in charge of the undertaking for a period of six months. It is now proposed to make this a permanent appointment.

Mr. Horace Boot, consulting engineer of Westminster, has been retained by the Chichester Electric Light and Power Co., Ltd., at a salary, and Mr. R. V. Weare, who has acted as clerk of the works, has been appointed the resident engineer.

Prof. Bragg, who was recently appointed to the Cavendish Chair of Physics at the Leeds University, has now taken up his duties.

Lieutenant Francis R. Holt-White, of the Royal Engineers, has been appointed instructor at the Military School of Electric Lighting.

Mr. F. H. Corson, Chief Assistant Engineer to the Blackburn municipal electricity works, is recommended for the post of Chief Electrical Engineer to the Worcester Corporation, and Mr. J. B. Feltham as Chief Assistant Electrical Engineer.

An assistant to the mains engineer is required by the Birmingham Corporation at a commencing salary of £150 per annum, rising to £250 per annum. Applications by May 3rd. (See an advertisement.)

Electric Shock on Tramcar.—In our issue for March 4th, p. 204, we reported the case of a passenger who received an electric shock through coming into contact with the trolley post on the deck of a West Ham Corporation tramcar. The accident took place on July 20th, 1907, when the plaintiff, who was at the time a tram-driver in the employment of the Corporation, was travelling on the upper deck of a car as an ordinary passenger, and in order to steady himself placed his hand upon the trolley post, and received a shock which burnt his hands. He was for five months in the doctor's hands, and as a result of the weakness which followed he was discharged from the Army Reserve in November, 1907, and had lost £47 reserve pay in addition to 84 weeks' pay at 35s. per week from the West Ham Corporation as a tramcar driver. The Corporation relied upon their bye-law that passengers' compensation for injury was limited to £25, as they were being carried below the maximum fares authorised. The jury awarded £500 damages, but judgment was reserved pending consideration of the point of law. With regard to the limit of compensation, Mr. Justice Coleridge gave his decision on this matter on Monday, and held that although the defendant was presumed to be aware of the bye-law in question, it was not binding, inasmuch as the Corporation gave a passenger no option but to travel at the fares published in the car, or not travel at all. He therefore gave judgment for the £500 awarded by the jury. Pending an appeal it was decided to hand to the plaintiff the £25 paid into court by the Corporation, and also £1 per week.

Black Smoke Emission at Lots Road.—The Chelsea Medical Officer of Health, in his annual report issued last week, states that large volumes of dense smoke continued to be emitted from the four chimneys of the generating station on Lots Road, of the Underground Electric Railways of London Co., Ltd., from the commencement of the year 1908, until the first week in June. Subsequent to that date the amount of smoke most materially decreased, and very little exception can now be taken to the smoke emitted from these chimneys. He was informed by the Resident Engineer to the Company that the great improvement noted above may be attributed (1) to the new revolving wire-mesh screen, inserted at a cost of £2,500, into the adit conveying the water of the Thames to the condenser pumps, which separates out the leaves and *débris*, which formerly so often occasioned choking of the pumps and a consequent loss of vacuum; (2) to the more thorough regulation of the draught to the furnaces through the fire doors, which has now been carried out on improved principles; and (3) to the use of coal of suitable quality, owing to favourable prices to the consumers being now current for such qualities of coal. It would appear, therefore, the Medical Officer goes on to say, that the Borough Council's proceedings in 1907 against the company, which were a failure, and resulted in the payment of 300 guineas costs to the defendants, were at any rate instrumental in convincing the company that there was room for improvement in the conduct of their works, *qua* smoke emission, and the results now obtained appear to be for the present satisfactory.

COMPANIES' MEETINGS AND REPORTS

WEMYSS & DISTRICT TRAMWAYS CO.—The report for 1908 shows total receipts amounting to £13,987, and after meeting mortgage debenture interest and making provision for depreciation, there is a balance of £3,176. As no interest was paid upon the preference shares for the half-year, the line being in course of construction, three half-years' preference interest at 6 per cent. is now recommended, in addition to a dividend of 6 per cent. upon the ordinary shares.

SWANSEA IMPROVEMENTS & TRAMWAYS CO.—The gross receipts for the December half-year of 1908 amounted to £27,362, a decrease of £454 compared with the corresponding period of 1907. The receipts for 1907, however, were abnormal owing to the Eisteddfod and other special attractions being held during that year. After meeting all expenditure and transferring £2,500 to renewals fund, there is a surplus of £4,951, to which is to be added £3,809 brought forward. It is recommended that £2,000 be placed to depreciation and reserve account, and after meeting the 6 per cent. and 5 per cent. preference dividends, a 3 per cent. dividend is recommended on the ordinary shares, carrying forward £1,561.

COVENTRY ELECTRIC TRAMWAYS CO.—The report for 1908 states that the net profits for the year amounted to £9,131, a decrease of £1,632 over the previous year. To this has to be added the sum brought forward, and, after meeting interest on mortgage bonds, &c., there is a sum of £6,607 available. After placing £2,000 to reserve for depreciation, a 3½ per cent. dividend is recommended, carrying forward £57.

CHISWICK ELECTRICITY SUPPLY CORPORATION.—The report for 1908 states that the undertakings at Chiswick and Aberystwyth owned by the Corporation continue to make progress, the number of consumers at the end of the year having reached 1,705 as compared with 1,574 at the end of the preceding year. During the year, £3,318 has been expended on capital account for machinery, mains, free wiring, &c. Towards the end of the year arrangements were made for adding £30,000 to the loan capital of the Corporation to be effected by issuing first debenture stock to the value of £80,000, and out of the proceeds redeeming the £50,000 first debenture previously issued, an arrangement which was satisfactorily concluded early in the present year. The total number of lamps, motors, &c., connected to the Corporation's mains at Chiswick and Aberystwyth was at the end of the year equivalent to 70,285 32-watt lamps, compared with 66,580 at the end of 1907. The profits for the year after paying sinking fund premiums and trustees' fees were £6,834. Out of this sum interest on debentures and temporary loans amounting to £2,760 has been paid, leaving a balance of £4,073, and the results of the year's working enable a dividend to be paid on the ordinary shares of 6 per cent., being the same as paid for 1907. The balance is to be carried to the depreciation reserve fund, which will bring the latter up to £1,122. The meeting is on Monday.

CRAIGPARK ELECTRIC CABLE CO.—The accounts for the year to March 31st show a net profit of £6,344, and the sum available, including the balance brought forward, is £7,027. After setting aside £1,000 for depreciation and £500 to reserve, a dividend of 6 per cent. is declared upon the ordinary shares, and the balance carried forward, subject to payment of directors' fees.

MERTHYR ELECTRIC TRACTION & LIGHTING CO.—The accounts for 1908 show total receipts from both lighting and tramways amounting to £17,839. After meeting debenture interest, placing £1,000 to renewals account, and adding the balance brought forward, there is a sum available of £4,740. It is recommended that £1,250 be placed to depreciation and reserve, and a dividend of 5 per cent. is declared. The sum carried forward is £490.

NATIONAL ELECTRIC CONSTRUCTION CO.—The report for 1908 shows a net profit of £28,028, including £9,049 brought forward from the last accounts. General reserve has been credited with £13,000, the sum of £3,430 has been transferred to reserve against capital charges, £387 written off depreciation, and the balance of £9,662 is carried forward. No dividends are recommended.

BABCOCK & WILCOX.—At the annual general meeting on Friday, the report and accounts given in our last issue were adopted. Mr. John Dewrance, the chairman of the company, who presided, said that the past year had been a very anxious one, business showing signs of deteriorating, and he was sorry to say that the immediate future did not seem particularly bright.

PRIMITIVA GAS & ELECTRIC LIGHT CO.—The report for 1908 shows that the total revenue amounted to £136,128. After meeting debenture interest and preference dividend, and adding £10,000 to general and reserve accounts, there is a profit of £44,903, out of which a final dividend of 4s. 6d. per share, free of income-tax, making 7 per cent. for the year, is recommended upon the ordinary shares, carrying forward £26,903.

URBAN ELECTRIC SUPPLY CO.—The report for 1908 states that the gross profits amount to £38,806, and, after deducting the London expenses, there is a balance of £36,864. After adding interest and deducting certain other items amounting together to £14,204, there remains a profit balance of £22,735, which falls short by £9,764 of the amount required to meet the 5 per cent. guaranteed dividends on the issued capital of the company. This deficit, being the debit balance as shown in the accounts, has been duly provided by Edmundsons' Electricity Corporation, Ltd., under their contract. Provision has been made of £1,680 for depreciation of plant and machinery, under the terms of the agreement with the contractors. The meeting is on May 5th.

DUDLEY, STOURBRIDGE & DISTRICT ELECTRIC TRACTION CO.—The report for 1908 states that the gross receipts amounted to £43,871. After deducting all expenses, including repairs and maintenance, and placing £1,000 to renewals account, there remains £10,188. Deducting the dividend on the preference shares accrued to Dec. 31st last, and adding the sum brought forward, £6,136 19s. 5d. remains for allocation. The sum of £1,000 is placed to sinking fund, £1,000 to depreciation and reserve, and a dividend of 4 per cent. per annum is recommended on the ordinary shares, leaving £136 to be carried forward. The terms of the lease and the amount of rent payable have been agreed upon with the Dudley Corporation, and subject to Parliamentary powers being obtained, the Corporation have agreed to grant a lease of the tramways and light railways purchased for thirty years from Jan. 1st last. The agreement further provides for the payment on July 1st next of the purchase money of the tramways and light railways. The arrangement for the management of all the tramways in the Black Country by the Joint Committee has continued to work satisfactorily, and the agreement with the other companies operating in the district has been continued for a further period. The number of passengers carried was 7,649,693, compared with 8,333,032, and the average receipts per passenger worked out at 1·35d., against 1·32d. The proportion of expenses to receipts was 65 per cent., against 61 per cent.

SOUTH STAFFORDSHIRE TRAMWAYS CO.—The report for 1908 states that the total revenue amounted to £48,087, against £49,787 for 1907. The expenditure, including rental of lines and other payments to local authorities, repairs, and maintenance of track, and interest on loans and debenture stock, amounted to £48,048. The profit for the year was therefore £39, which, with the £467 brought forward from the previous year, makes £506, which the directors recommend should be carried forward. The past year was the first complete year of operation by electric traction, but owing to the bad weather and the continued severe depression in trade in the district through which the company's cars operate, the results have fallen very much below the directors' expectation. In order to effect economies in power supply, the Jamesbridge power station has been closed and the plant therein disposed of, an agreement having been made with the Walsall Corporation for the supply of electricity required for working the tramways previously supplied with current from this station. In order to obviate further capital expenditure on the purchase of new rolling stock, an arrangement has been made to hire, through the Joint Committee, the necessary cars required for working the reconstructed lines in Tipton, Darlaston, and Wednesbury. The arrangement with the other companies operating tramways in the district for joint working under the management of the Joint Committee has proved satisfactory, and it has been renewed for a further period. The number of passengers carried was 8,859,415, as against 9,320,602. The average receipts per passenger amounted to 1·24d., as against 1·21d., and the average expenditure per passenger (apart from line rentals) was 0·85d., against 0·79d. The proportion of expenses to receipts was 68 per cent., against 65 per cent., and the number of electric cars in stock was 30, compared with 43 in 1907.

WM. GRIFFITHS & CO.—At a meeting of shareholders on Friday the scheme of reconstruction outlined in our last issue was discussed, and a resolution passed to the effect that it should only be agreed to subject to such modifications as may be approved by a shareholders' committee. The meeting further appointed an interim committee of shareholders.

PEARSON FIRE ALARM CO.—The result of the year's trading for 1908 has enabled the accounts to be closed with a debit balance of only £39, against a deficit of £527 last year. It is stated that the profits would have been still further increased but for the fact that several large contracts have had to be accepted at a very small margin of profit.

BROMLEY (KENT) ELECTRIC LIGHT & POWER CO.—At the annual general meeting last week the report and accounts given in our issue for April 1st were adopted. Mr. F. E. Gripper, the chairman, stated that the lamp connections had increased by 6,300 8-c.p., and the revenue by £520. This was certainly satisfactory, he said, when it was remembered that other companies were showing decreased revenues, entirely due to the introduction of metal filament lamps.

WOLVERHAMPTON & DISTRICT ELECTRIC TRAMWAYS CO.—The report for the year 1908 states that the revenue amounted to £23,882. After deducting all expenses, including debenture interest, repairs, and maintenance, and providing £500 for the renewals fund, there remains a profit of £1,776. Adding the sum brought forward, there is an available balance of £2,045. The directors recommend that the sum of £250 should be placed to depreciation and reserve fund, that a dividend of 1 per cent. per annum should be paid on the ordinary shares, and the balance of £197 carried forward. The terms of the

Digitized by Google

lease and the amount payable as rent to the Dudley Corporation have now been agreed, and, subject to the Corporation obtaining the necessary Parliamentary powers (for which a Bill has been deposited in the present session by them), a lease for thirty years from Jan. 1st last will be granted of the tramways previously owned by the company in Dudley. In consequence of the heavy cost of working cars equipped with the double equipment for use on the company's tramways and on the Wolverhampton Corporation's tramways, and to the fact that the receipts do not show any appreciable increase, the through services between Dudley and Wolverhampton were withdrawn on Jan. 9th last. The company has continued to benefit during the past year from the operation of its tramways as part of the system worked by the Birmingham and Midland Tramways Joint Committee, and the arrangement has therefore been continued. The number of passengers carried during the year was 4,282,882, against 4,381,837. The average receipts per passenger work out at 1·32d., against 1·36d., and the average working expenditure per passenger 0·95d., against 0·93d. The proportion of expenses to receipts was 70 per cent., against 68 per cent.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59. (Last week, £58 10s. to £58 15s.)

AGENCY.—The North-Western Electrical Appliance Co. have appointed Mr. James Turnbull, 3 New Street, Birmingham, their sole agent for the counties of Staffordshire, Shropshire, Worcestershire, Warwickshire, Northamptonshire, and Leicestershire.

JANDUS AND OTHER ARC LAMPS.—Messrs. Drake & Gorham, Ltd., of 66 Victoria Street, S.W., inform us that, at the end of the current month, they are relinquishing the sole agency for Jandus arc lamps, which restricted their sales to this particular make, and have concluded selling agencies under which they will be in a position to supply not only enclosed arc lamps of their own protected designs, but also some of the best-known makes of flame and enclosed lamps. They state that, owing to the termination of the arrangement with the Jandus Co., they will be in a position to offer to their clients all kinds of arc lamp accessories, including carbons of the same quality as hitherto supplied, at largely reduced prices.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS UP, &c.—A meeting of the Burmah Tramways Construction Co. will be held at 1 Queen Victoria Street, London, E.C., on May 24th, at 12 noon, for the purpose of hearing the liquidator's account of the winding up.

Amalgamated Radio-Telegraph Co.—In connection with the liquidation of this company, an offer was recently made by two gentlemen named Lees and Earl to purchase the assets for £26,500, and subsequently a Mr. Hage offered £33,000, which was provisionally accepted by the Registrar. Later on Messrs. Lees and Earl increased their offer to £35,000, and the liquidators were desirous of selling at this higher figure. Mr. Hage, however, contended that the provisional acceptance of his offer constituted a contract. Consequently the matter came before Mr. Justice Neville in the Chancery Division this week, and after hearing arguments his lordship decided that, having allowed the parties to bid one against the other, and provisionally accepting the offer of Mr. Hage for £33,000, the Registrar could not accept a later offer, even though it be at a higher figure. Leave to appeal was granted.

Telegraph Traffic and Movements of Cable Ships.—While the present situation in Turkey and Persia remains it is not to be expected that the telegraph lines should be in an efficient state. Communication between Rome and Constantinople was restored on the 21st inst., but this did not last for long, as it was again interrupted on the 22nd inst. The El Arieh route was restored to working order on the same day. On the 23rd inst. the direct telegraph lines between Saigon and Bangkok failed, and telegrams had to be sent *via* Oubone, subject to delay, but the lines were put in order on the same day; the same state of affairs ruled also on 24th inst. On the 25rd inst. the cable between Hong-Kong and Macao was restored to working order, while the land line routes *via* Fao and Hanekin between Alep and Bagdad, and between Diarbekir and Bagdad, were interrupted. Repairs were effected on 26th inst. The cable-repairing steamer *Mackay-Bennett*, belonging to the Commercial Cable Co., did not leave Halifax, N.S., during the last month, but she will be near Newfoundland by now, selecting a route and landing place for the Commercial Co.'s cable, which is to be diverted to Newfoundland, a new section being laid between Newfoundland (St. John's) and New York. The *Comte Amiral Caubet*, owned by the Compagnie Française des Cables Télégraphiques, returned to Halifax, N.S., after the repair of the New York-Haiti cable. Towards the end of last month the cable steamer *Minia* left to repair one of the Atlantic cables.

MISCELLANEOUS CITY NOTES

CHORLEY & DISTRICT TRAMWAYS CO.—A prospectus of this company was issued last week, offering 12,500 seven per cent. cumulative preference shares of £4 each at par, and 160,000 5 per cent. first mortgage debenture stock at £95 per cent. The share capital of the company is 50,000 7 per cent. cumulative preference shares of £4 each; 3,000 preferred ordinary shares of £10 each; 7,000 ordinary £10 shares; and first mortgage 5 per cent. debenture stock amounting to £160,000.

COLOMBO ELECTRIC TRAMWAYS & LIGHTING CO.—A dividend of 5 per cent., free of income tax, is recommended for 1908. The sum of £1,136 is carried to general reserve, from which account £7,000 has been taken to write down renewals to track. The sum of £2,227 is carried forward.

RIVER PLATE ELECTRICITY CO.—An issue of 25,000 6 per cent. preference shares of £1 each is being offered to the existing preference shareholders in the proportion of one new share for every four shares at present held.

RIO DE JANEIRO TRAMWAY, LIGHT & POWER CO.—The gross earnings for the fifteenth week of 1909 of the combined tramways, gas, electric lighting, power, and telephone services operated by the company amounted to £28,603, compared with £25,755 for the corresponding period of 1908.

POTTERIES ELECTRIC TRACTION CO.—The directors announce that after providing for depreciation and the preference dividend, they find themselves unable to recommend any dividend on the ordinary shares for 1908.

Wireless Telegraphy and Telephony.—The Portuguese Government have awarded a contract to a German firm to supply and erect five wireless stations in the Azores.

The new wireless station of the French Government at Rouge Terre, near Cherbourg, is now in working order, and messages have already been exchanged with the Mediterranean squadron.

A French naval surgeon on board the *Descartes*, which has been in wireless service off Morocco, reports several cases of conjunctivitis and other diseases of the eyes amongst the wireless telegraph operators. He attributes the affections to the action of ultra-violet rays from the spark. Two cases of eczema were also due, he thinks, to the same cause.

In anticipation of further labour troubles among the French telegraph operators on May 1st, the Minister of Marine is taking steps to provide for an efficient wireless service to deal with State communications. Cruisers fitted with wireless installations have been stationed at various points along the coast, to work in conjunction with the land stations.

The *Argosy* of British Guiana states that the equipment of the wireless station at St. Thomas has been completed. Quite two months must elapse, however, before the apparatus can be utilised for the transmission of messages, as Mr. W. J. Blenheim, the representative of the Lodge-Muirhead system, has now to go to Trinidad to do the necessary work there, which will take about eight weeks.

The West Stanley Colliery Disaster.—In a circular to the Durham Miners' Association, Mr. J. Wilson, M.P., writing with regard to the West Stanley Disaster (see ELECTRICAL ENGINEERING, April 8th, page 324), complains that although the seam in which the explosion occurred and the fact that it was a coal-dust explosion were settled during the inquiry, no indication was given as to how the coal dust was ignited, and no recommendations for the prevention of future accidents were made. Mr. Wilson concludes that, although Dr. Thornton asserted that the electrical apparatus was safe and reliable, he is convinced that the explosion was due to electrical causes in the manner suggested by Dr. Thornton, and asks that Dr. Thornton's recommendations with regard to keeping distribution boxes free from dust should be acted upon. A clear statement of the facts of the case appeared in the issue of ELECTRICAL ENGINEERING mentioned above, and it is be hoped that Mr. Wilson's agitation will be without effect.

A Russian Electric Railway.—A British Consular report states that the construction of an electric railway from Tiflis to Vladikavkaz, running where possible parallel to the Georgian military road, has been decided upon. The scheme will be carried into execution so soon as the funds required for building it have been found. The Viceroy and all the more important authorities in the country, as well as a large portion of the population of the country through which the line is to pass, are applying for better means of communication in the locality.

ELECTRICAL ENGINEER (29), seven years' experience meter testing; three years shifts, maintenance; requires change. Excellent testimonials. Box A 75, ELECTRICAL ENGINEERING, 203, Temple Chambers, London, E.C.

FOR SALE AT A GREAT SACRIFICE owing to being no longer required. Two alternator Gas Engine sets, 250 kilowatts each—direct coupled. Engines and machines might be sold separately. Apply Box A 74, ELECTRICAL ENGINEERING, 203, Temple Chambers, London, E.C.

For further Small Advertisements, see page x.

THE ELECTRICAL SYSTEM OF THE L.C.C. TRAMWAYS

At the Institution of Electrical Engineers, on Thursday, the discussion on Mr. J. H. Rider's Paper upon the London County Council's tramways was concluded. Owing to the late hour at which the discussion finished, Mr. Rider did not reply, but will deal with the criticisms of his Paper in the Institution journal. The Paper and previous discussions were published in our issues for April 1st and 8th.

Mr. W. H. Patchell pointed out that Mr. Rider's coal specification made no mention of ash. The use of small washed coal brought up the question of chain-grate stokers. He remembered some years ago burning washed nuts, from which he got very high value. When the Lots Road and Greenwich power stations came along with chain-grate stokers, however, washed nuts went up to a very high price, and he had to turn his attention to other classes of coal; and he thought it was a pity that large stations should restrict themselves in this manner to one type of fuel. With regard to the heating surface of Mr. Rider's boilers, did the figure of 3,300 sq. ft. include the heating surface of the superheater, and, if not, what addition should be made? The size of the boilers at Greenwich seemed to be very small in proportion to the size of the job. At the Bow Works of the Charing Cross Co., the boilers had a normal rating of 66,000 lbs., but they normally did 100,000 lbs. of water per hour. Some people had thought this too large, but he did not, and on a much smaller job of 5,000 kw., which he had had in hand lately, he had been putting in larger boiler units than those at Greenwich, namely, 30,000 lbs. of water per hour. An interesting test had been given in the Paper on one of the Greenwich boilers, which had 3,320 sq. ft. of heating surface and gave an efficiency of 79·49 per cent. The boilers for the above-mentioned 5,000 kw. installation were Stirling boilers with 6,209 sq. ft. of heating surface, with McPhail superheaters with 800 sq. ft. of heating surface, made up as an integral part of the boiler, and a test on dry fuel gave 80·29 per cent. The boiler and superheaters were combined with the economisers. He did not claim any greater thermal efficiency in the larger boiler, but he claimed a greater convenience in handling, and a very great saving in the cost of buildings and land. Whilst Mr. Rider was using his double compound engine, the space taken by this allowed plenty of room to put the boilers alongside; but when he came to use turbines, the space occupied by the boilers was much more important, and the larger boilers occupying less total ground space scored considerably. The amount of boiler plant at Greenwich also seemed rather large. Mr. Rider had 48 boilers for 34,000 kw. normal, and 42,520 kw. maximum load. On a test, four boilers would run one engine; and if they took 28 boilers for his seven engines, or say 32 to make quite sure, there were still 16 boilers to spare. Perhaps, however, the extra load to be squeezed out of the turbines in the future would occupy some of that extra boiler plant usefully. The question of water level in London was a very interesting one, and was becoming more important in view of the number of people putting down their own wells. A point that had struck him was that Mr. Rider's well delivered the water practically up to the ground level, 5 ft. above the top of the tube. Could Mr. Rider give the top of the tube level in comparison with ordnance datum? He had carried out pumping operations on the south side of the river as well as at Bow on the north side, and the water level was relatively very much lower than Mr. Rider found it at Greenwich. He had heard that the water level at Greenwich stood higher, but with all the pumping going on, he should have thought it would have fallen lower than Mr. Rider had mentioned. With regard to the Kennedy water meters, were they on the suction or delivery side of the pumps, as there was a good deal of difference in the wear and tear of the meter and also the accuracy with which it would read, according to which side it was connected? He congratulated Mr. Rider on the design of his steam separator, but thought its use hardly justified in this particular plant. There was a striking difference in the rating of the reciprocating and the turbo-alternator sets. The former were purchased for a power factor of 0·94 and the latter for 0·84, and he should like to know the reason for the difference. He would also like to know what was the power factor of the whole of the plant. He was surprised that the piston rings of the engines should have given out before the Corliss valves. He would like to know whether Mr. Rider had had any trouble with the latter. The engines at Greenwich, which were of the Manhattan type, differed from the original design in that the low pressure cylinder was horizontal and the high pressure cylinder vertical instead of *vice versa*. Mr. Rider claimed better drainage. It certainly was more natural to put steam in at the top and get steam and water out of the bottom. Mr. H. G. Stott, the engineer in charge of the Interborough station in New York, where there were some of the heaviest of this type of engine, had not experienced any trouble whatever with the cylinders in their original positions. It was interesting to note how close was the efficiency of the engines in London and America. Mr. Rider gave a test of a 5,000 kw. set, which took 16·88 lbs. of steam at 80 lbs. pressure with 80 degrees of superheat, and Mr. H. G. Stott had published a very complete test of one of his 3,500 kw. sets which took 17·05 lb. of steam at 150 lbs. pressure with saturated steam. It would be expected that the larger engine would have a slightly greater efficiency, yet if they corrected for the saturated steam and the lower pressure it would be found that the 3,500 kw. set tested by Mr. Stott took 20,300 B.Th.U., and that Mr. Rider's 5,000 kw. set took 20,900 B.Th.U. On the question of surface condensing Mr. Rider had allowed 6½ lbs. per sq. ft. per hour for condensing with the reciprocating engines, but he had not given the figure for the turbo sets. He was very glad that Mr. Rider had turned to normal ways of thinking in rating his plant. When the Electric Power Bills for London were before Parliament, it had seemed that the proper way was to charge all items to some other account, to omit all that they conveniently could, sit on the safety valve, and divide the output into the remaining capital cost. Although Mr. Rider had gone in for induction motor generator sets, he had not yet settled how to start them. He compromised by starting his small sets from the D.C. side, and then the larger sets from the A.C. side. When he (Mr. Patchell) was designing the City plant, he had put in induction sets to the extent of one or two machines in each sub-station, so that when they had no D.C. to start from they could start from the A.C. side through the induction sets, and then get the synchronous machines away. He had had trouble with the induction machines similar to that mentioned by Mr. Rider, and if he had to put up that plant again, he should certainly put in synchronous machines only. The experience of Mr. Rider with the breaking-down of end-coils brought up the old fact in coil winding, that if they wound to the end of a bobbin and back again they invariably got breakdowns. Consequently they had to wind the bobbins in sections and connect them up in series, which was practically what Mr. Rider had shown was the remedy. He (Mr. Patchell) had got over his troubles by putting coils outside the machines. He was firmly convinced that there was most certainly a rise or a concentration of pressure on the early turns in the coils that might be got over by shielding through an outside device. The sudden application of high pressure produced a mechanical shock. This led to disintegration, which subsequently developed into an electrical fault. This effect was strongly exhibited in the power station at Niagara, where he had seen a transformer and set of resistance boxes for applying up to 100,000 volts pressure on the line insulators for testing purposes. Every time an insulator broke down they had to suspend the tests until the resistance boxes had been rewound, because they could not get them to stand. When they put a choking coil on each side of the resistance boxes, however, they had no further trouble. A very interesting point in the Paper was the comparative cost of sub-stations and generating stations. The cost of the sub-stations came out at £10·24 per kw., and that of the generating plant at £23·63 per kw., and as the relative amounts of sub-station and generating plant were as 5 to 3, or 1·7 to 1, he thought it was a text that might be preached to some of the men who tried to price out a power scheme by only considering the generating end of it and yet intending to supply direct current. Not only did Mr. Rider's Paper demonstrate the fact that the cost of the generating plant was practically only equal to half the total cost of the plant, but that all the cables and the street work had to be paid for in addition. He congratulated Mr. Rider on the clean and tidy appearance of his station, which compared in this respect with any Continental or American station.

Mr. K. Edgcumbe (Messrs. Everett, Edgcumbe & Co., Ltd.) said that the question of reverse current relays was so important that it should not be passed over too hastily, and he would very much like to have some further facts from Mr. Rider as to the troubles which he had experienced. It appeared from the Paper that these reverse-current relays had been guilty of cutting out generators when they should not have done so. It did not follow from this, however, that the only alternative was to do away with all protection on the generators. He thought the real trouble had been that the settings of the reverse current relays had been abnormally low. About 10 per cent. of the output of the generator had become the usual thing to ask for; in fact, some engineers went as low as one-twentieth of the output. This might be right on small plants, but on large plants where they had surges to reckon with, and still more, where they had a number of generators running in parallel, they were bound to get temporary reversals of energy, and in that case the alternative was to put in a time lag. This, perhaps, was to be deprecated, as the longer they left the generator on, the more trouble there was likely to be; but on the other hand, he thought that even a definite time lag of that sort was infinitely preferable to the indefinite time lag depending on the alacrity of the switchboard attendant in

Digitized by Google

cutting out the generator, even if he reached the right generator and did not pull out the wrong one. The only objection to setting the relays for a much heavier reverse current was that on the occurrence of a bad fault the bus-bar voltage was certain to drop, and with the ordinary watt-meter pattern of relay, this entailed a corresponding increase of the current necessary to operate it, but he did not think that a temporary increase of current to even four or five times the normal output of the machine would hurt the generator. The real solution was to arrange the relays so that the tripping current was to a large extent independent of the voltage. It was not a difficult matter to arrange a relay so that if the voltage fell to one-tenth or one-twentieth of the normal value, the tripping current would not be more than doubled. Therefore, before Mr. Rider irrevocably changed the word "almost" into "quite" with regard to being convinced that it was better to be without reverse current relays, he would like him to try altering the settings of his relays at Greenwich to a much higher value.

Mr. H. M. Sayers said that with Mr. Rider's permission he would mention one or two facts about the behaviour of the induction motor generators used in one of the L.C.C. sub-stations, which went to support Mr. Patchell's remarks as to the mechanical element in the failure. A point was selected at the centre of the end windings of one of the stator windings to which was fixed a small stylus. On the machine being run up to speed in the usual way, the point of the stylus traced out a line showing a mechanical movement of the coils at the moment of switching on. In some cases the movement was as much as three-eights of an inch circumferentially, and one-eighth of an inch axially, and in the form of a figure eight. It was clear that this meant a considerable mechanical stress on the insulating material, and he thought it was quite clear that a winding built up of one turn per layer, as in the type A (see Electrical Engineering, April 1st, page 301) would stand the electric stress better than coils built up with many turns per layer. He would like to know whether Mr. Rider had taken oscillographs of the current at the moment of switching in these machines as well as of the voltage, as the current was probably very high, and varied a good deal with the exact phase moment at which the machine was switched in. Mr. Rider's choice of the induction motor had been criticised, but he was not surprised that he had not chosen the rotary converter for tramway work. He was surprised, however, that Mr. Rider had not chosen the best machine of its kind ever built, namely, the La Cour motor-converter. This was a very satisfactory machine for railway work, and Mr. Roger Smith had some in use on the Great Western Railway which were working extremely well. They were light and small for their output, and it seemed to him that they combined the best characteristics of the rotary converter and the induction motor generator. The figures given in the Paper as units delivered to the sub-stations, namely, 66,836,000, did not enable one to calculate the works costs, or to take out the efficiency of the transmission system, and he was a little curious to know what that number of units really meant. Taking the car miles run for the same year at 29,000,000, it worked out to 2·3 units per car mile. This was a very heavy consumption, even for an L.C.C. car. In the year ending March 31st, 1907, the units generated were 32,782,000 for 16,267,000 car miles, or 2·02 units per car mile. Therefore, for the year ending December 31st, 1908, there was an apparent increase of 14 per cent. in the units per car mile, or rather 14 per cent. more units delivered to the sub-stations than units generated per car mile run in the previous year. Further, in addition to this 14 per cent., there had to be added transmission losses, so that it appeared that the total increase was from 20 to 25 per cent. in the units generated per car mile. It was difficult to understand this, although he knew that a larger proportion of bogie cars were now in use. A point upon which the Paper threw a good deal of light was the commercial case for the big station. They had had this matter from the Parliamentary point of view *ad nauseum* during the past few years. Greenwich was a very good example of what could be done on a lower Thames site, and he thought that a works costs of 0·331d. per unit was a very creditable showing; in fact, it was very near the limit of what was claimed in the committee rooms in connection with the London Power Bills. This low cost was got on a capital expenditure of very nearly £24 per kilowatt. If they added the capital charges per unit, it came to a considerably larger sum than that given in the evidence before Parliament. With regard to transmission losses, Mr. Rider had some sub-stations ten miles away from the generating station. If he delivered the energy at 6,600 volts on a power factor of 90 per cent., a 0·15 sq. in. cable worked at 1,000 amperes per square inch would deliver 1,404 kilowatts with a loss of 13·7 per cent. of the energy delivered. Assuming the choice of the most economical copper section, the total cost of transmission worked out at about twice that; in other words it cost 27·4 per cent. of the generating cost to get the energy delivered ten miles away without conversion. If instead of delivering the energy ten miles away, they had another generating station five miles off, and if the extra cost of coal due to the station site was not increased by more than ten or twelve per cent., there would be a net saving on the cost of the energy delivered to the sub-station by using two stations instead of one. He thought this was a moral which they did not learn in the Committee rooms.

Mr. G. L. Addenbrooke, with regard to the supply of water to the boilers at Greenwich, and the necessity of blowing down 5 in. every day, at a cost of about £500 per annum, said it had occurred to him that, with turbines, it might pay to use even distilled water altogether, as they did to a large extent on board ship for the make-up required for the boilers, as this was such a very small percentage of the whole.

Mr. Addenbrooke has supplemented the above remarks by a written communication, in which he states that the addition of a small amount of lime after distillation would prevent acidity and pitting. In marine work, the make-up was usually taken as 5·0 per cent. of the water passing through the boilers; and it would be interesting if Mr. Rider would give the equivalent figure for the Greenwich plant. With pure feed water, boilers of the Yarrow and Thornycroft type with small tubes and a high rate of evaporation for meeting peak loads, could be used. Finally, Mr. Addenbrooke asks for further details of the large sum for buildings and foundations included in the cost of the station.

Mr. J. M. G. Trezise (Assistant Superintending Engineer, G.P.O.) asked for further information regarding the spark-gaps provided for protecting the feeder cables; did discharges take place through them, and, if so, how did they act? Were any means provided for indicating that the discharge had taken place, and was any trouble experienced in keeping them in order? With regard to the water pumped from the Thames, it was stated that no less than 15 per cent. found its way back to the river without being used. As the capacity of each strainer was said to be one million gallons per hour, with a head of 30 ft., this meant the useless pumping of 3,600,000 gallons per day. The large amount of power required to drive the circulating water pumps had been attributed by Mr. Bailey to some defect in the design of the pipes. He had made some calculations in order to arrive at the amount of power required to pump the leakage water through the strainers. There were two 34-in. pumps having a capacity of 12,000 gallons per minute, or 720,000 gallons per hour, and the motors were each of 250 b.h.p. Consequently, the leakage water at each strainer, viz., 50,000 gallons per hour, would require 52 b.h.p., equal to 377,278 B.O.T. units per annum. If two strainers were in use, the continuous waste, of course, would be 104 b.h.p., or 754,555 units per annum, and so on with additional strainers. These figures rather showed that the high cost of pumping the circulating water was due to the loss of water in the strainers. The great disadvantage of having the pumps on the river side of the strainer was that the strainers did not protect the pumps, and consequently it was necessary to depend on the fixed strainers in the catch-pits to protect the pumps. Mr. Rider mentioned that water was used to seal the periphery of the strainer, and it would be interesting to know how much water was used, and, if it was obtained from the town supply, what it cost per annum.

Mr. J. E. Salter (South Lancashire Tramways Co.) thought that Papers on tramway subjects before the Institution were far too infrequent, having regard to the fact that £76,000,000 were invested in tramway undertakings in the United Kingdom. He thought that the power-house might have been differently situated so as to avoid such a very heavy expenditure for transmission cables. The power-house might have been situated at Southwark, for instance. If Mr. Rider had made an estimate of the saving, he would like to know what it represented in capital charges on the cables per car mile. Mr. Rider had been very candid in saying that the conduit system was subject to many faults from which the overhead system was free, and had given about six pages of the ingenuity which he had displayed in getting over them. The results of the generating station were highly creditable, but it seemed that there must be something wrong in the efficiency of the distribution or in the motors on the cars. The only installation which could be at all compared with that of the London County Council was at Glasgow, and there the consumption per car mile was 0·45 units, whereas in London it was 2·23 units. Again, with regard to the cost of the feeder system, this must be enormously greater than in the overhead system, due to the duplication of cables owing to the impossibility of using a rail return, and he would like some information with regard to this. Probably one of the most remarkable departures from ordinary tramway work was the use of shunt-wound machines. He had never heard of any complication in working compound machines; this simply involved an equalising bar, and he had never had any trouble with reversal of polarity with rotary converters. He could therefore only assume that the use of shunt-wound machines had something to do with the inherent defects of the conduit system. It might also be that the low efficiency in transmission and distribution were partly accounted for by the use of shunt-wound machines. The E.M.F. at the motors must vary much more than with compound-wound machines; and when the load was heavy, the E.M.F. must be very low, so that the speed of the tramcars had to be maintained at the expense of current.

Mr. H. Brazil (Charing Cross, West End, & City Electricity Supply Co.), speaking with regard to the automatic earthing switch, which he thought complicated and costly, said that Mr. Rider's remark that Greenwich was the only station in which

Digitized by Google

this device was used, was likely to remain true for a long time. With this apparatus there was an interval of time between the shutting down of the earthed machine and the connecting up of another machine during which the system was left entirely isolated; further, if the system were divided into two or more parts, only one of these parts could be earthed by this device. This he thought was very dangerous, as a time of very big surges might occur whilst the neutral was unearthed, and put a strain on the insulation of the machines which would not occur otherwise. He thought that a system of this description should have the feature that the time from the appearance of the short-circuit to the cutting-out of the feeder should be as small as possible. He suggested an arrangement of resistances consisting of troughs in which was placed a carbon powder made by the Morgan Crucible Co. The ohmic value of the resistance was highest at the time the fault occurred, and could be made to decrease to any extent desired, if left on. These resistances would stand a very large amount of power for a short time. The resistances were connected as shown in Fig. 1, which represents three machines with their neutral points connected, first through a small resistance, *A*, on to a common bus-bar, and then through a larger resistance, *B*, to earth. The resistances were high when cold, and thus reduced the circulating currents passing between the machines. Mr. Rider had stated that 3·5 ohms was the highest figure that he must have for his resistance in order to ensure the opening of the cut-out on a very long feeder. If they assumed that the carbon resistance was reduced to one-third its value, they could afford to have it 17·5 ohms, or five times that of Mr. Rider's at the start, and it would go

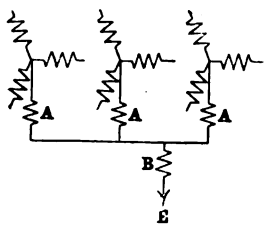

Fig. 1.—Mr. Brazil's Arrangement of Earth Resistances.

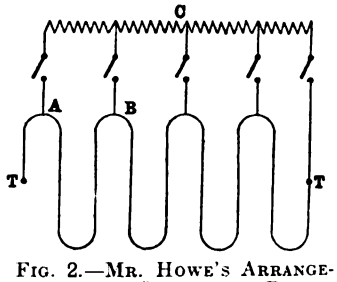

Fig. 2.—Mr. Howe's Arrangement for Preventing Breakdown of Outside Coils.

through all the values down to 3·5. They therefore got 17·5 ohms in the earth circuit, which gave 212 amperes, whereas with Mr. Rider's 3·5 ohms, they got 1,000 amperes at the time the short-circuit occurred. This 212 amperes should be sufficient to trip the cut-outs, but if it were not, the resistance itself automatically decreased until just sufficient current passed to enable the cut-outs to trip. The cost would be something like one-tenth of Mr. Rider's arrangement. With regard to the arrester gaps, it would be interesting to know how these were connected. Mr. Brazil further suggested that choking coils put in between the neutral points and the common earthed bus-bar would reduce the triple-frequency currents considerably.

Mr. A. D. Clarke (Underground Electric Railways Co. of London) asked what was the amount of air in the circulating water per thousand cubic feet. This was a trouble which they had had at Chelsea when they began working. He would like to have some more information about the earthing resistance. They had recently had to design a new one at Lot's Road, and he would like to know what was the weight of Mr. Rider's. He had found that to carry 6,000 kw. for ten minutes it was necessary to have five or six tons of metal. With regard to the switchgear, he drew attention to the two low tension auxiliary feeders coming off the same bus-bar. If anything went wrong with that section of the bus-bar, the auxiliary motors would naturally stop, and they would get no circulating water, with the result that the machines would go to atmosphere. With reciprocating engines, a considerable load could be carried on atmosphere, but with turbines it was different, and he was afraid Mr. Rider would have considerable trouble in carrying any load if this occurred. With regard to the test of the engines, it appeared that the efficiency of the generator was better at half load than full load, the consumption being 16·67 lbs. at half load, and 16·88 at full load. This was very unusual. With regard to the boilers, although they were certainly small, Mr. Rider managed to get quite a large evaporation from them, and a very good efficiency of nearly 80 per cent. But if they started to work backwards from the actual flue temperature, it would be found that the amount of air supplied per lb. of coal was only about 12 lbs., in which case the CO_2 was 19 per cent., which was not only unusual, but practically impossible. He thought that the actual efficiency of the boiler should be 74 per cent., and did not think 80 per cent. could be obtained. With regard to the coal specification, his experience was that it was a very poor coal indeed which did not reach 13,000 B.Th.U. when dry, and he had found that washed coal contained less moisture than unwashed coal, owing to the fact that it was the dirt in the coal that retained the moisture, and he thought that 7 instead of 10 per cent. would be quite fair to the coal contractor.

Mr. G. W. O. Howe (Central Technical College) suggested two methods by which the electrical shock to the induction motor windings on switching on would be prevented. In the first of these, which is illustrated in Fig. 2, a high non-inductive resistance, *C*, is placed in parallel with the motor winding before closing the switch, tappings being taken from the resistance to the connections between the stator coils. This shunt could be automatically disconnected by pushing the main switch home, and need only be in use for a fraction of a second. It would cause the whole of the winding to be raised to the full potential instead of the full pressure existing between the points A and B, when the terminal T was connected to the bus-bar. Another method was to put a number of condensers in series across the terminals and to tap off from the wires joining the condensers to the wires joining successive stator coils. These condensers could be fitted once for all and left permanently connected.

Mr. J. H. Rider stated that although he would much rather have given his reply face to face with those who had criticised the Paper, he was compelled to reserve it for publication in the Journal, for the reason that he could hardly do himself justice in attempting to reply briefly.

The President (Mr. W. M. Mordey), in proposing a vote of thanks to Mr. Rider, stated that the Council had decided to devote three evenings to the Paper, because they thought it was an extremely important and valuable one, and that it was essential to get as many opinions with regard to the matters raised in it as possible. Personally, he was thankful to Mr. Rider for the Paper, because the first thing he did when elected president was to go to Mr. Rider and ask him to write a good, practical Paper; and this was the result.

The following are brief abstracts of the communications which have been received up to the present:—

Mr. R. A. Chattock (Engineer and Manager, Birmingham Corporation Electricity Department) asked for further information with regard to Mr. Rider's experiences with reverse-current relays; he had had considerable difficulties in the past, but thought the relays installed by the B. T.-H. Co. at the Birmingham Corporation Station could be relied upon to act under the condition of a failing field or a reverse current, and that they would be unaffected by any condition of forward current so long as the field current was normal. With regard to the earthing arrangements, earthing the neutral point was unnecessary, he thought, for pressures as low as 6,600 volts. A shock from the outers of an unearthed system was not so dangerous as from an earthed system, and greater expense was entailed in connection with protective devices in the latter system, as they had to be put on all three phases instead of on two only.

Mr. F. Forrest (Birmingham Corporation Electricity Department) referred to the fact that 75 per cent. of the sub-station plant consisted of induction motor generators in spite of the fact that the general consensus of opinion was in favour of rotary-converters. In Birmingham, where rotaries were used for both lighting and traction, he had not, he said, had a single machine or transformer failure during the two and a quarter years they had been running. The number of rotaries installed was 21, in various sizes from 300 to 1,500 kw. With rotaries, the sub-station efficiency of 75 per cent. would have been at least 7 per cent. higher. As the plant load factor would approximate 45 per cent., the half-load efficiencies would be more important than the full-load efficiencies, and for 500-kw., 25-cycle machines, the half-load efficiencies were about 88·5 per cent. for the rotary converter, and 81 per cent. for the induction motor generator; at full-load they were 91·5 per cent. and 89 per cent. respectively. In conclusion, he doubted the use of the spark-gaps installed at Greenwich, and would like to know whether they had ever been known to operate.

Mr. W. H. Collis (Deputy Electrical Engineer, Liverpool Corporation Electricity Works) writes that in the Lister Drive station of the Liverpool Corporation there are seven 2,000-kw. turbo-alternators, four of one type and three of another, the neutral points of which are connected to earth without resistances. The machines are connected to the bus-bars by lead-covered armoured cables, and the armouring forms the neutral earth connection. It was found that there were considerable circulating currents in the armouring of these cables, but that they only occurred when dissimilar machines were running in parallel. Now, the machines are run in two groups of like generators, only one group being earthed at a time, and it is expected that this will put a stop to these circulating currents.

At the time of going to press we have received from Mr. Leonard Andrews, of the Key Engineering Co., Ltd., a copy of a communication to the discussion, comparing the relative advantages of a water-side site and a site more or less in the centre of supply necessitating cooling-towers for condensing purposes. Mr. Andrews concludes with the statement that at the time when Mr. Rider started the Greenwich scheme, there was little choice as far as generating costs were concerned, but that at the present time it would be possible to put down two gas-driven stations at a lower capital outlay than that involved in the Greenwich scheme, and with lower running costs. We are obliged to hold over the body of Mr. Andrews' remarks until next week's issue.

CATALOGUES AND PAMPHLETS RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

FLASHERS FOR ADVERTISING SIGNS.—We have received from Messrs. Voss & Co., of 14 New Yard, Great Queen Street, London, W., a booklet describing several patterns of the "Voss" flasher. These include the simple thermal flasher, in which the make and break is produced by the expansion and contraction of a bar heated by the current, and more complicated devices, comprising a thermal flasher and an electro-magnetic attachment, the latter being used for circuits taking above 2·5 amperes. These flashers work equally well on direct and alternating current. A small pattern constructed in the body of a lamp-holder can be obtained, and two-way flashers for currents up to 20 amperes are also listed.

OVERHEAD EQUIPMENT.—A supplement to the catalogue of tramway overhead equipment, issued by British Insulated & Helsby Cables, Ltd., of Prescot, contains full particulars of Prescot non-fouling hard-drawn copper trolley wire, with the results of tests carried out at the works. Various patterns of ears, section insulators, terminal clamps, trailing and mechanical frogs, fixed crossings, and other accessories for use with the wire are listed. Prices and particulars of "Prescot" trolley wheels, line insulators, hangers, &c., are also given. The list is fully illustrated and well arranged.

SUNDRIES.—Two leaflets relating to plain and ornamental cigar-lighters for use on circuits up to 220 volts, and to massage motors, respectively, are to hand from the Electrical Co., Ltd., of Charing Cross Road, London, W.C. The latter describes small motors with flexible shafts and massage apparatus, for both continuous and alternating circuits.

PRIMARY BATTERIES.—We have received from Messrs. Siemens Brothers & Co., Ltd., of Caxton House, Westminster, a copy of their new catalogue, entitled "Fluid Galvanic Batteries," which consists of some 46 pages of printed matter, profusely illustrated and containing full descriptions and technical data of all the more generally employed types of fluid primary cells. It is divided into three sections; the first deals with the Daniell cell and its many modifications; the second is devoted to the cells of the Leclanche type, including the porous pot, agglomerate and "sack" forms, besides firing batteries and batteries for field telegraphy and testing, and concludes with some notes on the best methods of charging Leclanche cells; whilst the third section deals with the Bunsen, Grove, bichromate, and the copper-oxide "Neotherm" cell described in ELECTRICAL ENGINEERING of April 22nd, page 371. The catalogue concludes with a list of materials for charging primary cells. This publication, which will be sent free on application, should appeal to all who are interested in the subject of primary batteries.

ADVERTISING SIGNS.—A circular from the Sun Electrical Engineering Co., Ltd., describes a new collapsible illuminated sign which can be erected or taken apart in a few moments.

ROLLER BEARINGS.—A new list dealing with roller bearings for line shafting has been issued by the Empire Roller Bearings Co., Ltd., of 15 Victoria Street. A saving of power is claimed as against plain bearings, amounting to 20–25 per cent., and fully 25 per cent. saving in oil. The standard swivel shafting bearings are made in various sizes for shafts from 1 to 10 inches diameter.

INSULATING MATERIALS.—The Ruberoid Co., Ltd., of 81-83 Knightrider Street, Queen Victoria Street, London, E.C., have sent us a binder containing some twenty leaflets, giving full particulars and prices of the "P. & B." insulating tapes and cloths, fibre and presspahn sheet, compounds, paints, and varnishes manufactured by this firm. Water-proof adhesive tape for trolley poles, prepared linen for coil insulation, and a compound for painting copper rail-bonds to prevent the corrosive action of the cement and the earth gases, are among the items mentioned. Included among the varnishes is a special baking varnish for insulating the laminations of oil-immersed transformers; for air-cooled transformers an air-drying varnish is supplied. Full information as to temperature and duration of baking is given for the baking varnishes, as well as the spirits most suitable for thinning. We understand that the company was recently awarded a contract for the supply of 900 gallons of "P. & B." varnish for the London County Council.

Hillhead Telephone Exchange.—On Saturday, the 17th inst., the National Telephone Co. transferred the subscribers connected to its Hillhead exchange to the new central battery equipment which has been manufactured and installed by Messrs. The Western Electric Company of North Woolwich. The equipment, which is of the Western Electric Company's No. 1 C.B. type, consists of thirty-two subscribers' positions giving accommodation for 3,000 lines and ten incoming junction positions; the ultimate capacity of this type of switchboard being 10,000 lines. The equipment is similar to that installed at the company's Birmingham Midland Exchange, a description of which was given in our article by Mr. H. S. Plymen in ELECTRICAL ENGINEERING of March 4th, page 206.

FREEZING OF NIAGARA

IN ELECTRICAL ENGINEERING of April 15th (page 341), we referred to the danger and damage to the Niagara generating stations by the extraordinary accumulations of ice which led to a stoppage of the flowing water over the falls. Some further particulars of the way in which the power stations were affected are given in the *Electrical World* (New York) of April 15th. The quantities of ice passing down the gorge did great damage to the property adjoining the transmission lines. The ice in the gorge between the falls and Lake Ontario caused the flood to back up, and these conditions endangered the station of the Ontario Power Company at the water's edge on the Canadian side. By the Saturday morning the station was out of commission, and the company found it necessary to issue the following statement:—

"During the night the unprecedented accumulation of ice below the falls, extending for nearly nine miles to Lewiston and beyond, caused the water to rise about 40 ft. above normal. The maximum record for high water in the past, covering a period of seventy years, is about 28 ft. above normal. The power house is designed with its windows about 7 ft. above the highest previous known height of water. Last night, however, the water exceeded this previous record by about 12 ft., and the water and ice poured through the windows and south door of the power house, at once causing a stoppage of the machinery. Temporary connection is being made, through the courtesy of the Electrical Development Company, with that company's works, and the steam reserve plants at Rochester, Syracuse, West Seneca and elsewhere are being used to supply a portion of the load in the State of New York. The intention is to supply the public-service corporations first, such as railroads and lighting companies, and afterward the manufacturers and private users. No permanent damage is done to the power house or its machinery. As soon as the water is pumped out of the power house it will only be necessary to clean and dry the machinery before resuming full operation. The money loss is extremely small, but the inconvenience suffered by customers is, of course, serious. A recurrence of the accident is impossible, as the windows will be built up solid to a height above any possible rise of water in the future, and the south door, which is not necessary to the operation of the works, will be closed with masonry."

At the same time that the water damaged the station of the Ontario Power Company, it reached a height of 2 ft. above the basement floor of No. 2 station of the Niagara Falls Hydraulic Power & Manufacturing Company, but as the basement is shut off the water did not get in. The turbine and generator installation was still about 8 ft. above the water, and no damage was done. This would indicate that the torrent of water that plunged over the falls was held back by the ice between the station of the Niagara Falls Hydraulic Power & Manufacturing Company and the falls, forcing it to back up into the Ontario station, as it did not flow off rapidly enough to care for the downpour over the falls. While the Ontario Power Company's steel towers were placed high above the river below the Devil's Hole, the ice reached and damaged them.

Electrical Trades' Benevolent Institution.—The annual general meeting of the Electrical Trades' Benevolent Institution will be held at the Hotel Cecil, Strand, to-morrow (Friday), at 4 p.m., Sir William H. Preece, K.C.B., F.R.S., in the chair.

Light Railways in 1908.—The report of the Light Railway Commissioners for the year 1908 states that a total of 579 applications for Orders to authorise light railways (which includes 87 applications for amending Orders) have been made since the commencement of the Act. In respect of 366 applications (15 in the year 1908 and 351 in previous years), Orders have been submitted to the Board of Trade for confirmation; five other applications, in respect of which Orders are under settlement, have been approved by the Commissioners; and 197 applications have been rejected or withdrawn. The decisions with respect to four applications have been deferred, and seven new applications made in November last remain to be considered. The Commissioners state that though they do not think it necessary to repeat again in their report the reasons set out in their report for 1906 for which amendments of the Light Railways Act, 1896, appear to be required, they think it desirable again to draw attention to the need for the construction of light railways which has been found to exist in many parts of this country, and to express the opinion that such a need is unlikely to be met unless and until some amendments of the Act are effected. During 1908, there were 18 Orders confirmed, authorising 80 miles of line with an estimated cost of £601,729.

BUILDING EXHIBITION AT OLYMPIA

THE Building Trades Exhibition, which closes on Saturday next, is thoroughly representative of architectural and building interests, and for this reason is well worth a visit. There are, however, few exhibits of electrical interest. Most of the stands are, of course, illuminated with metal filament lamps, and in some cases very artistic effects have been attained.

There is a large stand to demonstrate the advantages of lighting by "Tubolite" fittings, in which the straight filament lamp units are fixed in aluminium trough reflectors. Metal filament lamps for these fittings can now be obtained; particulars of these lamps will be found elsewhere in this issue. Several stands in the exhibition are illuminated with the aid of "Tubolite" fittings, and, in one case, indirect lighting is employed with a very artistic effect.

To demonstrate their system of wiring for small installations and temporary work, Messrs. Tredegar & Co., of 52 Victoria Street, Westminster, S.W., have a stand wired on this principle. A cable from the generating set terminates in a heavy plug which fits into a socket on the distribution board. This board contains, besides the switch fuses, a socket for each circuit, into which the corresponding plug is fitted. The cables are armoured with spiral steel wire or a woven wire covering, and the whole of the wiring is carried out by means of plug and socket fittings. Thus, at each point, the cables plug into a wooden fitting, which is provided with a lamp-holder, and the lamp pendant is hung from this by means of an adapter. Switches are fixed in the lamp-holders proper. Special tee- and cross-pieces are also provided. Messrs. Tredegar & Co., supply a complete installation for Colonial or country work which, they claim, can be erected and run by anyone, as the wiring is carried out on the above principle, and consists merely in connecting up with plugs and sockets and adapters. The petroleum engine is provided with magneto ignition, and the dynamo is either belt-driven or direct-coupled to it. A small set is exhibited which is capable of supplying twenty-five 16-c.p.-25-volt metal filament lamps, the total running costs amounting to 1d. per hour. The price of such an installation, including wiring, switchboard, lamps, and fittings, works out at a little over £100. Larger installations, and also storage batteries for use in combination with such plants, can be obtained, with wiring, &c., on the same principle. Among the other exhibits on this stand are several examples of the "Float" (liquid primary cell) portable lamp, in which the electrodes are inserted in the liquid and the lamp lit by reversing the containing case. The 5-c.p. lamp can be lit for twelve hours on one charge.

A "Waygood" electric lift is doing service between the ground floor and the gallery, and Messrs. R. Waygood & Co., Ltd., also have several models of lifts and cranes on a stand adjacent to this lift. Among these is a model of a patent jib crane, in which the load remains practically level whilst the jib is luffed in or out, enabling a very small luffing motor to be used, as there is only the friction of the moving parts to be overcome. A 110-ft. jib crane of this pattern is being constructed for the Colonial Wharf, London. The main motor is 50 h.p. direct-current, the luffing motor 20 h.p., and the slewing motor 10 h.p. The level of the load is kept constant by carrying the lifting rope four times round sheaves at the back of the jib, the distance between which varies as the jib is raised or lowered. The firm also exhibits a rope grip which can be fitted to both electric and hydraulic lifts. Normally, the gripping device is held off by means of a solenoid which pulls against a spring; if any gate is opened, the circuit is broken, and the spring causes the rope to be gripped and the lift stopped.

Messrs. Mathews & Yates, Ltd., have a large number of electric fans, blowers, &c., on view, as well as a working model of their improved "Cyclone" wood refuse collecting apparatus, showing how refuse from wood-working machines and saws can be collected and deposited by means of exhausters and separators. The Seyssel & Metallic Lava Asphalte Co. show a skeleton model of the L.C.C. generating station to illustrate the firm's method of constructing asphalt roofing with valley gutters, flooring, damp-courses, &c., and a number of models are exhibited by the Patent Indented Steel Bar Co., Ltd., to show their reinforced concrete construction. The British Uralite Co. exhibit a number of samples of their fire-resisting and insulating material which is composed of asbestos fibre cemented together with a mineral glue, and another form of fire-proof partition material is shown by Messrs. Gardel, Ltd. An important feature of this material is that it can be channelled for the reception of wiring conduit after erection. Messrs. Richard Hornsby & Sons, Ltd., exhibit a Hornsby-Stockport gas engine to give 17 b.h.p. with suction gas, or 21 b.h.p. with town's gas. The engine is running off town's gas, and is coupled to a dynamo by the Lancashire Dynamo and Motor Co., Ltd., which delivers current at 100 volts for the lighting of the stand. A complete suction-gas plant suitable for the above engine is also shown.

A series of electric light fittings designed to harmonise with a panelled room and decorations of the seventeenth and eighteenth centuries is exhibited by Messrs. C. J. Thursfield & Co., of Berners Street, London, and a fine collection of metal work fittings, including a number of electric light fittings, switches, bell pushes, &c., is shown by the Birmingham Guild of Handicraft, Ltd., of Newman Street, London. Among the latter fittings is a handsome lantern containing four 50-c.p. Osram lamps, which has been especially designed and constructed for the Glasgow Liberal Club. The Glover-Lyon Ventilation Co., Ltd., have a room ventilated on their patent system, and also exhibit an electric fan with the speed-reduction slipping friction coupling described in ELECTRICAL ENGINEERING of November 19th, Vol. IV., page 670. Several patterns of the "Kennedy" bending machine, which is particularly suitable for bending steel wiring conduit, are shown by John Barker & Co., Ltd. The exhibit of the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., comprises mainly rubber tiling and other objects of non-electrical interest, but some samples of lighting cable and other insulated wire are shown. Messrs. A. W. Pocklington & Co., of 109 Victoria Street, exhibit a series of electric pulley-blocks manufactured under Gese's patents. These are very compact little machines, and can be used in conjunction with hand-operated cranes, or can be suspended from girders. They are especially useful where a lifting appliance intermediate between the large power cranes and the old pattern hand-power pulley-blocks are required, and can be obtained for loads up to 8 tons, and for either direct or alternating (three-phase) current. Another interesting exhibit is that of the Roberts' Patent Filling Machine Co., which comprises a number of automatic machines for filling tins or boxes with predetermined amounts of liquid or powder. When the tin is full to the degree required, the weighing table on which it stands is depressed, and this closes an electrical circuit in which is comprised a solenoid device to close the tap of the filling machine. Current is taken from the lighting circuit by means of an adapter. Messrs. Heenan & Froude, Ltd., the Horsfall Destructor Co., Ltd., and Messrs. Hughes & Stirling have exhibits relating to the destruction and utilisation of refuse, and the Ruberoid Co., Ltd., have included in a representative collection of their manufactures, some samples of insulating tape. An automatic push-button lift is exhibited by the Medway Safety Lift Co.; this is provided with an arrangement whereby a gate cannot be opened unless the lift is at that gate, and the lift cannot start unless the gate is closed. It is claimed that these lifts will stop within ½ in. of the floor level when operating at speeds up to 120 ft. per minute, owing to the employment of a specially shaped cam for operating the floor level switches. Messrs. Pinchin, Johnson & Co., Ltd., of Minerva House, Beirs Marks, London, E.C., have a stand decorated with their fine enamel paint; this firm also makes a speciality of insulating varnishes.

Electrical Equipment of a Large German Steel Works.—The following particulars of the electrical equipment of the Röchlingschen Eisen- und Stahlwerke at Völklingen-Saar are taken from a recent issue of *Electrische Kraftbetriebe und Bahnen*. The power house, which is located near the large furnaces, has a total capacity of 9,300 h.p., and contains eight units. There are two steam-driven sets, one of which is a 550-kw. Brown, Boveri-Parsons turbo-alternator. The gas-driven sets comprise three with Augsburg-Nürnberg engines, and two with Erhardt & Sehmer engines, the former being direct coupled to 1,350 kva. alternators and the latter to 850 kva. flywheel alternators. There is also one small gas-driven set. All these engines run on blast-furnace gas. The steam sets generate at 400-volt, 50-cycle, three-phase, and the gas sets at 5,000-volt, 50-cycles, three-phase, but the low- and high-pressure sets are run in parallel, there being three oil-cooled transformers of 850 kva. each. Eleven motors in the works, with a total output of nearly 4,000 h.p., receive current direct at 5,000 volts. Among these is a 2,000 h.p. rolling-mill motor. With the exception of a few portable motors which are supplied from the 100-volt lighting circuits, the remaining motors are connected to the 400-volt power mains. The 5,000-volt current is distributed through three-core cables laid underground, there being in all some six miles of this high-pressure cable. For the low-pressure power distribution over 40 miles of bare copper wire supported on iron poles is in use, and the lighting cables are also carried overhead. One group of motors is just one mile distant from the power station. There are in all five transformer sub-stations in different parts of the works for supplying the 400-volt power circuits from the 5,000-volt supply. For the general lighting of the works 575 arc lamps, of which 180 are flame arc lamps, are employed; most of these are connected eight or nine in series across the 400-volt mains. Besides these there are some 4,800 incandescent lamps of 25 candle-power each; these are supplied at 100 volts by means of over 40 transformers connected to the 400-volt power mains. The power factor of the works is very low, being generally between 0·6 and 0·65. A certain amount of continuous current is used in the works, and one 100-h.p. motor-generator supplies current for welding purposes only. There are over 400 motors with a total capacity of about 15,000 h.p. Besides the 2,000-h.p. motor already mentioned there is an 850 h.p. motor also driving a rolling mill, 109 crane motors with a total capacity of 2,300 h.p., and 42 motors driving pumps.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 22nd, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

4,597/08. **Switch-fuses for Three-phase Motors.** V. Hope. In switches for three-phase motors with no starting resistance it was necessary to provide fuses of sufficient capacity to stand the starting current. These afforded little protection to the motor when running, and, moreover, permitted the motor to restart after a temporary failure of current if it was not switched off. According to this invention, fuses to blow at a certain overload are fitted in the switch case, but on starting up are short-circuited, either by larger fuses or by copper bars. Immediately the switch-handle is released, a spring removes the large fuses or bars, leaving the switch closed and the small fuses in circuit. If the motor is left in circuit after a failure of current, it will not start, as the small fuses will blow. Two claims, three figures.

4,922/08. **Metal Filament Lamps for Series Running.** C. H. Stearn, C. F. Topham, W. Handcock, and A. H. Dykes. This specification describes the substitutional carbon filament and the means for putting it in circuit automatically on the failure of the metal filament, used in the Stearn multiple bulb lamp. (See Electrical Engineering, April 30th, 1908, Vol. III., page 651). Two claims, two figures.

8,308/08. **Prevention of Deposit on Enclosed Flame Arc Lamp Globes.** W. J. Davy. The arc is surrounded by a glass cylinder, which extends down nearly to the bottom of the inner enclosing globe. No deposit is formed on the interior of this cylinder, as it is kept hot, and, furthermore, there is a strong draught of air along the inner surface. Above the bottom plate of the body of the lamp is a metal cylinder which surrounds the cylindrical chamber containing the controlling mechanism. Air passes up through the glass cylinder, past the arc, up between the metal cylinder and the mechanism chamber, then down between the metal cylinder and the outer case, and finally through perforations in the metal ring between the glass cylinder and the inner globe into the latter. The chemical residue is deposited on the cool metal surfaces. Four small flame carbons in parallel are used on top, and one large plain carbon below, this preventing failure to strike due to a deposit of silica on the lower carbon. Seven claims, four figures.

13,719/08. **Ventilation of Squirrel-cage Rotors.** J. C. B. Ingleby. The slots are wound with bare or insulated strip conductors set radially side by side, and spread apart immediately they leave the rotor core so that each strip forms a radial fan blade. The ends of the strips are firmly held at each end by a short-circuiting ring with saw-cuts equally spaced round the periphery. These rings may be supported by lugs cast on the rotor end-plates, or may be fixed direct to the shaft by a light spider. By this means a good circulation of air round the stator and rotor end windings is ensured. One claim, five figures.

17,438/08. **Tungsten-Nickel Alloy.** Siemens & Halske Akt.-Ges. A ductile alloy of tungsten and nickel is obtained by intimately mixing the two metals in the form of powder or reducible compounds, and then sintering the product together by heating below the melting point of tungsten. A suitable alloy which may be rolled and drawn into wire, contains 10 per cent. of nickel, and if a pure tungsten wire is required, the nickel can be removed after drawing by heating the wire by passing a current through it in a vacuum. The powdered metals or compounds are pressed into rods 1 or 2 mm. in diameter, and these are heated in quartz tubes through which hydrogen is passed. The temperature is raised gradually up to about 1,600° C., and kept at this for some minutes, during which time the rods are converted into an alloy of tungsten and nickel. Three claims.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Langworthy [Choking coils for use with arc lamps] 8,298/08; Gebr. Siemens & Co. [Electrode for searchlights] 1,516/09.

Distributing Systems, Cables and Wires, and Insulating Materials, &c.: Fennell and Perry [Wiring system] 6,972/08; Oberlies [Reinforced concrete pole for transmission lines] 8,523/08.

Dynamos, Motors, and Transformers: Ateliers Thomson-Houston (*Anciens Etablissements Postel-Vinay*) [A.C. compensated repulsion motor] 7,621/08; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Machines] 7,945/08; Fynn [Commutating machines] 9,033/08; Rhodes Motors, Ltd., and Fielden [Control of induction motors] 14,518/08; Lang [Control of motors] 20,969/08; Delon [A.C.-D.C. converter for high-potentials] 1,070/09; Maschinenfabrik Oerlikon [Single-phase commutator motor] 4,652/09.

Electrometallurgy and Electrochemistry: Knowles [Furnaces] 13,502/08.

Ignition, Electric: Thompson (*Mea Fabrik Magnet-Elektrischer Apparate Ges*) [Ignition apparatus for multiple cylinder engines] 3,199/09.

Incandescent Lamps: Siemens & Halske Akt.-Ges. [Increasing the ductility of tungsten] 17,350/08.

Instruments and Meters: Fennell and Perry [Meters for limiting the amount of energy passed] 7,646/08; Nalder Bros. & Thompson, Ltd., Handcock and Dykes [Meter systems] 7,886/08; Aron [Meters] 21,576/08.

Switchgear, Fuses, and Fittings: Hindle [Motor controllers] 177/08; Crompton & Co., and Crompton [Motor controllers] 4,799/08; Byng and Gunner [Watertight lamp-holders] 7,595/08; Charles [Tumbler switch] 12,689/08; Harrison [Combined switch and fuse] 13,766/08.

Telephony and Telegraphy: Scheller [Production of high-frequency oscillations] 8,277/08.

Traction: Turner [Electric braking] 7,941/08; Millard [Trolley head for tramcars] 9,360/08; Wilson and Moon [Air brakes] 12,431/08; Angle [Conduit traction system] 14,528/08; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Signalling] 14,868/08; Railless Electric Traction Co. (*Schiemann*) [Trolley poles and collectors] 15,753/08; Snaith [Brakes] 24,887/08; Boardman and Lea [Tramway point control] 25,603/08; Justice (*American Automatic Switch Co.*) [Operating track points] 27,906/08; Pettigrew [Brakes] 27,974/08; Roach [Operating track points] 856/09; Lay [Signalling] 4,772/09.

Miscellaneous: Rosenberg [Depositing metal] 7,227/08; Selman, Picard, and Heath [Depositing metal on porcelain] 7,230/08; Carver [Electric reciprocating tools] 7,800/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Garde and Adams [Electrodes of secondary cells] 2,749/09; Busse [Welding rail joints] 2,750/09; Müller [Combustion-engine generating set] 7,595/09; Burstyn [Diaphragm condensers for wireless telephony] 7,906/09; Krüger [Regenerating blackened carbon filament lamps] 8,283/09; Dewhirst [Furnaces] 8,299/09; Michel [Regulator for air brakes] 8,446/09.

Amendment Allowed.

Further particulars will be found in the Official Journal of the Patent Office of April 21st, 1909.

12,759/02. **Manufacture of Incandescent Lamps.** A. Swan. Leave has been granted for the amendment of this specification, an abstract of which was given in Electrical Engineering of March 4th, 1909, page 215.

Expiring and Expired Patents

The following Patents expire during the current week after a life of fourteen years:—

8,573 of April 30th, 1895. **Cables.** W. S. Smith and W. P. Granville. The conductors are fixed near the inner surfaces of crescent-shaped strips of gutta-percha, which are formed into a tube, twisted, and covered with insulation.

8,661 of May 1st, 1895. **Electrolytic Process.** G. W. Johnson (*Heyden*). Production of benzo-sulphonimide by the electrolysis of toluene-sulphonamide and caustic alkali.

8,728 of May 2nd, 1895. **Plates for Secondary Cells.** J. G. A. Rhodin. Plugs of lead, consisting of rolled up strips, are inserted in holes provided in the frame plate. The strips are cut from lead sheet, which has been passed between fluted rollers, and consists of ridges connected by thin films of the metal.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, Motors, and Transformers: S. C. Davidson [Bearings on machine frames for backgear shafts] 518/03.

Traction: L. A. Krieger [Driving and steering electric automobiles] 567/97; W. Brierley and R. Foster [Coupling for lighting and signalling wires] 571/98; C. W. Hunt [Steering of electric automobiles] 593/00; E. P. Wetmore [Stud-switch for surface-contact system] 360/02; W. M. Brown [Contact-shoe for surface-contact system] 380/02; C. V. Boys [Moulds for welding rail-joints by "Thermite"] 622/02; Dolter Electric Traction (*H. Dolter*) [Skate for surface-contact system] 667/02; Soc. Anon. d'Electricité et d'Automobiles Mors [Speed-gear for electric automobiles] 3,466/02; R. J. Sheehy and A. G. Curphey [Block signalling system with live and dead sections of track] 267/03; W. M. Brown [Prevention of short-circuits on surface-contact systems] 330/03.

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

An alteration has been made in the procedure for applying for revocation of patents, on the ground that they are worked mainly or exclusively abroad. (Page 408.)

The first annual meeting of the Electrical Trades Benevolent Institution was held on Friday, when it was announced that the funds now amount to £2,464. Sir William Preece, who presided, said he felt that a greater response should have been made to the recent appeal, but, in his opinion, this was due to trade depression, which had been largely brought about by the attacks in Parliament and in the lay Press, upon the electrical industry. He gave an instance of the difficulties now experienced in obtaining capital for electrical undertakings in this country. (Page 410.)

A contribution by Dr. Sumpner to the continued correspondence on parallel running of three-phase alternators with earthed neutrals, suggests the use of choking coils between the neutral points of the machines and the earthing bar. Mr. F. J. Dykes writes pointing out the relations of the various harmonics which can be present in the wave forms. Mr. W. Brew favours an auxiliary star-wound piece of apparatus, with earthed neutral permanently connected to the bars. Mr. H. E. O'Brien prefers hand switching to the automatic earthing switch used at Greenwich. This is also favoured by Dr. W. M. Thornton, who also points out that alteration of the pole tips of the individual machines is not in itself sufficient to ensure that no circulating currents shall be produced. (Page 411.)

A fire, resulting in the partial destruction of the roof of the north-west wing of the Central Technical College, South Kensington, occurred on Monday afternoon. It is thought that it originated in the overheating of the chimney of a muffle-furnace. (Page 413.)

Some further communications to the discussion on Mr. J. H. Rider's Paper on the electrical system of the London County Council's tramways, have been received. One of these, from Mr. L. Andrews, compares the capital and maintenance charges on the piers and condensing system of the Greenwich station with those of a non-waterside station with cooling towers and rail-borne coal, the conclusion being

Digitized by Google

arrived at that there is little difference between them. Mr. Andrews suggests that two gas-driven stations at different points in the area would have been more economical. In another communication, suggestions for reducing the circulation of triple-frequency currents in the neutral earth-connections are given. (Page 414.)

The battery which is about to be installed in the Dickinson Street generating station of the Manchester Corporation will probably be the largest storage battery in this country. It is to be employed to use the surplus power of the traction generators to assist in dealing with the peak of the lighting load, and at the same time to deal to some extent with the traction peaks. (Page 415.)

In pointing out that large gas engines are by no means exclusively produced abroad, attention is called to the construction of some engines of considerable size, designed and made entirely in England by the Premier Gas Engine Co. (Page 415.)

A new regulating motor starter, a form of back gear for small motors, an automatic time switch, and an electric water heater are described in short articles on pages 417 and 418.

Dr. Gisbert Kapp and Dr. Dennis Coales have developed a method of measuring the insulation resistance of earthed three-wire networks during working, which enables the individual fault resistance of the three mains to be ascertained. (Page 419.)

Mr. Miles Walker's Paper on the improvement of power factors, originally read at Manchester in January, was discussed by the Birmingham Section of the Institution of Electrical Engineers last week. (Page 420.)

A Paper on electric welding was read recently by Mr. V. D. Green before the Birmingham and District Club, in which the principal industrially worked processes of electric welding were described. The author outlined the arc and acidulated water processes, and described in greater detail the applications of the Thomson process, in which the heat is obtained by heavy currents passing through the work itself. (Page 421.)

An arrangement of combined no-volt and overload release for motor starters is described on page 422.

A comparison is made between ordinary telephone cable and that laid upon the Martin-Dieselhorst multiple twin system. Curves are given to show the relation between transmission values and costs and weights of conductors. (Page 423.)

A small Standing Committee has been formed at Birmingham to deal with any differences that may arise from time to time in the conduct of the gas and electricity undertakings.—The Blackburn Corporation Electricity Undertaking for 1908–9 shows a profit of £1,000, but there is a loss of £4,800 on the tramways.—A loss of £1,600 is anticipated upon the working of the Brighton Corporation tramways for 1908–9.—It is expected that Blackfriars Bridge will be ready for the tramways in November.—The Stepney Borough Council once more refuse to agree to the overhead system of trams on the Aldgate to Bow route.—A contribution of £75,000 is to be made by the Manchester Tramways Committee in relief of rates.—A net profit of £3,762 is shown by the Preston Corporation tramway accounts for 1908–9.—The adoption of the trackless trolley system is recommended by a sub-committee of the Sheffield Corporation Tramways Committee.—York ratepayers have polled in favour of the Corporation working the tramways. (Page 425.)

The Aberdeen Corporation propose spending £17,000 on their electrical undertaking, the Cardiff Corporation £2,960, and the Watford Council £4,952. A 750-kw. steam generating set, boiler, &c., is required by the Wigan Corporation; arc-lamp globes by the Bristol Corporation; carbons and mechanical stokers by the Leyton Council; arc-lamp carbons by the St. Pancras Council, and feeder pillars by the London County Council. (Page 426.)

At the annual meeting of the National Electric Construction Co. last week, the chairman stated that owing to the attitude of local authorities, the company would not undertake the promotion of any further tramway schemes in Great Britain. The present unsatisfactory position of the South Staffordshire Tramways Co. was attributed, at the annual meeting on Thursday, to the results of municipal "bullying." (Page 427.)

Among the specifications published by the Patent Office on Thursday was one by Nalder Bros. & Thompson, H. W. Handcock, and A. H. Dykes for a limit switch for use in connection with the "contract demand" system of charging. The use of commutating coils without magnetic cores in conjunction with a compensating winding for high-speed D.C. machines is claimed in a specification by V. A. Fynn, and Siemens & Halske Akt.-Ges. have one relating to the manufacture of lamp filaments from a ductile alloy of tungsten and nickel. The series-parallel control of traction motors is the subject of a specification by J. G. Lang; in this system, one motor is short-circuited on the series field of the other before reconnecting in parallel, and the circuit is not interrupted. A meter which only registers when the power taken exceeds a certain limit is described by H. Aron. An appeal has been lodged against the decision of the Comptroller to grant a patent to D. B. Morison for a system of automatic thermal storage, as employed in generating stations. A patent for apparatus used in automatic telegraphy, and another for air-insulated cables, in which the conductors are arranged in folded paper, expire during the current week. (Page 430.)

Doubtless in view of Mr. Justice Parker's recent pronouncement with regard to the procedure under the Revocation Clause of the Patents Act (Electrical Engineering, April 1st, 1909, p. 314), a new set of rules has been issued by the Patent Office. The applicant for revocation of a patent on the ground that it has been worked mainly or exclusively outside the United Kingdom has now to leave at the Patent Office, simultaneously with his formal application for revocation of the patent, evidence in the form of a statutory declaration, giving actual "particulars" in support of his allegations. A copy of this has also to be delivered to the patentee or his agent. Within fourteen days of the receipt of this, or within such further time as the Comptroller may allow, the patentee must reply with a statutory declaration, stating whether or not the allegations contained in the application are correct, and if they are incorrect, giving the particulars upon which he intends to rely in answer to the allegations made by the applicant. Copies of this evidence in reply are to be delivered to the applicant, as well as to the Patent Office. The applicant may then put in further statutory declarations in answer as before. The Comptroller will then announce whether he proposes to hold a preliminary hearing in order to decide if a *primâ facie* case has been made out by the applicant for revocation, or whether he intends in the ordinary course to deal at one hearing with the whole case. If the Comptroller decides, after the preliminary hearing, that a *primâ facie* case has been made out, or if he has decided that the preliminary

Digitized by Google

hearing should be omitted, he will then give to the patentee and the applicant time for filing further evidence in the form of statutory declarations as before. There is also a new rule as to costs in the case of applications for revocation which are not contested by the patentee. In deciding whether costs should be awarded to the applicant in such cases, the Comptroller will consider whether proceedings under the Section might have been avoided, if reasonable notice had been given by the applicant to the patentee before the application was filed.

The new rules, although protecting a patentee to some extent from purely malicious applications for the revocation of his patents, will hardly help him in the case of a trade competitor who wishes to learn as much as possible with regard to the extent of his business relations in this country, the details of his agreements with licensees, and other important matters. Not only will these be accessible to the applicant for revocation if he has made out a *primâ facie* case for revocation under the Act, but, even if he is not ultimately able to do so, he may extract a great part of the information in the form of a reply to his first application, which, under the new rules, will still have to be submitted to him. Surely, when once the Comptroller has had his attention drawn by the applicant to the patent in question, he should be able, without any further assistance from the applicant, to make the necessary inquiry as to whether the patent is adequately worked in this country.

As much discussion has centred upon the application of batteries to central stations as on any matter connected with electrical engineering, and the decision of Mr. S. L. Pearce to instal in the Dickinson Street generating station of the Manchester Corporation a battery of a size hitherto unseen in this country, is of great importance. The way in which it is to be used is a new step in central station practice, and the results showing the economies effected will be awaited with interest. By the aid of an ingenious arrangement of suitable boosters, the battery is to be made to form, so to speak, a connecting link between the load curves of the traction and lighting sides of the undertaking. The capacity of the traction generators which have to be kept running during the daytime to deal with the tramway peaks, will be diminished in the usual way by there being a battery across the 'bus bars, but the adjustments will be such that the batteries will be fully charged by the end of the period before the lighting peak comes on. The cells will then be used to assist the lighting peak, and thus the total plant capacity necessary in the station will be greatly diminished. Thus the battery will combine the functions of a "buffer" battery with true electrical storage on a large scale.

Tramway Strike in Cork.—On Wednesday, April 28th, the conductors and motormen of the Cork Electric Lighting and Tramway Company struck work in consequence of the refusal of the manager of the company to reinstate some men who had been recently discharged. The men have been agitating for some time, however, for shorter hours and better pay. On April 30th, the strike extended to the power-house employees, and the clerical staff is doing some of the work in order that the supply of light and power to the city shall not be interrupted. The tramway system is entirely suspended, however. So far no overtures for settlement have been made, and the Conciliation Board has not been summoned.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 6TH.

Institution of Electrical Engineers.

8 p.m. Meeting at the Royal Society of Arts, John Street, Adelphi. Paper to be read:—"The Theory and Application of Motor Converters," by H. S. Hallo.

Röntgen Society.

8.15 p.m. Meeting at 20 Hanover Square, London. Paper to be read:—"An Illustrated Description of the Historical Collection of Tubes Recently Deposited at the Victoria and Albert Museum," by Dr. G. H. Rodman. Mr. H. C. Head will show a new localising apparatus designed by Staff-Surgeon Dr. Gillett. Mr. Rafferty will show and describe a tube with plan for altering the metal of the anti-cathode. A note "On X-rays Produced at a Magnetically Deflected Cathode Focus," will be read by Mr. J. H. Gardiner.

MONDAY, MAY 10TH.

National Electrical Manufacturers' Association.

2 p.m. Committee Meeting at Balfour House, Finsbury Pavement, London.

THURSDAY, MAY 13TH.

Iron and Steel Institute.

10.30 a.m. Annual General Meeting at 25 Great George Street, Westminster, London.

Institution of Electrical Engineers.

8 p.m. Meeting at the Society of Arts, John Street, Adelphi. Paper to be read:—"Economies of Medium-sized Power Stations: A Study of Comparisons between Steam, Gas, and Oil Engines," by A. J. J. Pfeiffer.

FRIDAY, MAY 14TH.

Iron and Steel Institute.

10.30 a.m. Annual General Meeting at 25 Great George Street, Westminster, London.

7.30 p.m. Annual Dinner at the Hotel Cecil.

Physical Society.

8 p.m. Meeting at the Imperial College of Science, Exhibition Road, South Kensington. Papers to be read:—"On a Bifilar Vibration Galvanometer," by W. Duddell, F.R.S. "Effect of Temperature on the Hysteresis Loss in Iron in a Rotating Field," by W. P. Fuller and H. Grace.

Royal Institution.

9 p.m. Evening Discourse by Prof. G. E. Hale on "Solar Vortices and Magnetic Fields."

SATURDAY, MAY 15TH.

Institution of Electrical Engineers: Students' Section.

10 a.m. Visit to the Silvertown Works of the India Rubber, Gutta Percha & Telegraph Works Co., Ltd.

Junior Institution of Engineers.

Visit to the Works of the British Thomson-Houston Co., Ltd., Rugby.

Action *re* Suction-Gas Generating Plant.—An action has been brought by Mr. C. A. Seebold, lessee of Worthing Theatre Royal, against Messrs. Page & Miles, Ltd., contractors, of Brighton and Worthing, to recover damages for alleged negligence in constructing and erecting an electric lighting plant for the theatre. Repairs and alterations are stated to have cost the plaintiff a sum of £273, and a further claim of £52 paid to the Worthing Corporation for a temporary supply is also made. The defendants deny negligence, and counterclaim for £25 for extra work done. In 1906, the lighting supply was being taken from Worthing Corporation at about 6d. per unit, and, after receiving several estimates from Messrs. Page & Miles for a private plant, Mr. Seebold accepted an estimate for £410, the work to be completed in January, 1907. Between this time, when the plant was handed over by the contractors and the sum paid, and October, 1908, there was frequent trouble with the plant, but alterations carried out between June and October, 1908, were effective, and there has been no trouble since. The hearing came before Mr. Justice Bucknill in the King's Bench Division on Tuesday, April 27th, and Thursday, the 29th. The contractors put down the producer plant and a gas-engine supplied by the National Gas Engine Co., and a belt-driven dynamo, but the foundations and exhaust pit were constructed by a local builder, not being included in the above estimate. It appears that the pit was not strong enough to stand the explosions of unburnt gases which accumulated, and that the damage done by these explosions not only involved expensive repairs, but prevented the engine from working, and necessitated a supply being taken from the Corporation mains for a considerable period. It was also stated in the evidence that the man in charge was not capable to look after the plant. Capt. H. R. Sankey, who has been called in to give expert evidence, stated that the engine, gas producer, and dynamo were among the best of their kind on the market, and that they were properly installed, but that a silencer would have been better than the exhaust pit actually built. The hearing is to be continued to-day (Thursday), when further evidence will be given by Capt. Sankey.

ELECTRICAL TRADES BENEVOLENT INSTITUTION

THE first annual meeting of the Electrical Trades Benevolent Institution was held at the Hotel Cecil on Friday, under the presidency of Sir William H. Preece, K.C.B., F.R.S.

The report of the Committee of Management for the year 1908-1909 stated that the year has been one of considerable activity in different directions. Messrs. Alabaster, Gatehouse & Co., proprietors of the *Electrical Review*, signified their willingness to contribute a sum of £50 to the funds if some special form of activity were displayed in the work of the Institution. An immediate response to this offer was not possible, due to the Manchester Electrical Exhibition taking place in the autumn of 1908. The Manchester Exhibition having proved successful, a sum of about £350 is coming at an early date to the Institution. It was felt that the announcement of this sum, together with others, could be most appropriately made at a festival dinner, and a committee was appointed to arrange this function. A special collection both before and at the festival dinner was made, resulting in the receipt of over £660, so that the result of the year's working has been to increase the funds of the Institution by over £1,100. During the year two cases for relief came before the committee, and, both proving deserving ones, were promptly attended to with most satisfactory results. Other cases are now before the committee for consideration. The invested funds are sufficient to pay one or more pensions, but by the rules no pensions can be allotted before next year. The Committee of Management and the Dinner Committee have been most active in collecting funds, but it is desirable, now that the Institution is becoming well known, to secure the co-operation of one or more persons in every undertaking to act as collectors for the Institution. The Institution has had to give up the use of the offices at 2 Queen Anne's Gate, Westminster, S.W., kindly loaned free of all charge by Mr. C. S. Northcote, but there is every probability that the Institution of Electrical Engineers will, in its new home on the Thames Embankment, provide accommodation for meetings in connection with this Institution, also free of charge. The executive office remains at Ridler Place, Blackfriars, London. The committee thank Mr. C. S. Northcote for his kindness in providing offices free of charge to March 25th, 1909. The thanks of the Institution are also due to the Press for support on many occasions. Representatives of the electrical Press have been on the Dinner Committee, and have displayed great activity also in that direction.

The funds of the Institution are invested as follows :—£1,100 in Victoria 3½ per cent. funds. £600 in Cape of Good Hope 3½ per cent. funds. The Olympia Electrical Exhibition fund, in which the Institution has a contingent interest, falls in in March, 1911, when it will amount to about £400. A sum, as mentioned in the report, will accrue to the funds almost immediately from the Manchester Electrical Exhibition, 1908, of about £350, making the funds at present in hand or certain to accrue, including £64 cash in hand, £2,464.

Sir WILLIAM PREECE, in addressing the meeting, expressed his great satisfaction at the result of the festival dinner (ELECTRICAL ENGINEERING, April 1st, p. 313), although he would have felt more cheerful had there been a larger number of subscriptions and donations. This was, no doubt, due to trade depression, and he could not help feeling that this was brought about not so much by the ordinary changes to which all businesses were periodically subject, as by the action of Parliament itself. The electrical industry was really the offspring of Parliament, and it had suffered from the very opposite treatment that it ought to have received from those who brought it into existence. All those trading under Acts of Parliament in the electrical world had been attacked in the Houses of Parliament in the severest way. This really commenced in the year 1898, when Sir James Kitson (now Lord Airedale) was considering the first electric power Bills. Since then there had been constant attempts both in Parliament and in the lay Press to extend this interference with the electrical industry. These attacks had always been made on the basis that the electrical industry had been a failure; but those in the industry knew that this was not so; they had improved from year to year, and there were now £370,000,000 invested in the electrical industry. This action of Parliament and the lay Press was reflected in the money market to-day as it affected the electrical industry, for it was impossible to get money for any new electrical scheme. Not very long ago, as a director of an electrical company, he had endeavoured to obtain a large loan. He was met with the answer that if he had required £100,000 for Canada, or New Zealand, or any Colonial scheme, there would have been no difficulty, but as it was for a home industry, they would have to pay through the nose for it; and they did. Coming to the objects of the Institution, Sir William repeated Mr. Mordey's explanation at the festival dinner, viz., that it is to assist that class of worker in the electrical industry not at present protected by a trade union. The Committee of Management had full powers to act with regard to all applications for relief, but he thought it should be understood that their decisions would naturally be influenced by the way in which the applicant had assisted the Institution during his days of prosperity. In other words, in order to avoid any appearance of charity, the scheme should be self-contributory. On this point he said he wished to encourage the giving of donations payable in yearly sums; for example, a donation of £20, payable in yearly instalments of £5. A person could then be a yearly subscriber in addition. In conclusion, Sir William Preece stated that eventually the electrical industry must take some steps to have some control over the education of those who were being brought up to the industry, not in the scientific sense, but the education of those who had to deal with questions of finance. As an example, he mentioned that Mr. Lloyd George's Budget showed in many respects that he had not learned the scientific basis of finance or the meaning of the great principle of circulation that was found in business to be so essential to the profits and success of industry of all kinds.

The following retiring members of the Management Committee were re-elected :—Messrs. H. H. Berry (Berry, Skinner & Co.), H. Bevis (General Electric Co., Ltd.), Guy Burney (Sterling Telephone & Electric Co., Ltd.), E. J. Clarke (Hart Accumulator Co., Ltd.), Justus Eck (Union Electric Co., Ltd.). The members remaining in office are :—T. J. Grainger (Sunbeam Lamp Co., Ltd.), E. F. Johnson (Croggan & Co., Ltd.), P. A. Lundberg (A. P. Lundberg & Sons), F. H. Nalder (Nalder Bros. & Thompson, Ltd.), C. S. Northcote, H. Oppenheimer (International Electric Co.), W. Schmahl (Armorduct Manufacturing Co., Ltd.), L. Thurnauer (Falk, Stadelmann & Co., Ltd.). The following additional members were elected to the committee :—Sir J. Irving Courtenay, T. Gatehouse (*Electrical Review*), R. J. Wallis Jones, E. Garcke, W. B. Esson, and E. Skinner.

Messrs. Hextalls were appointed honorary solicitors to the Institution, and Mr. E. Henley Smith honorary auditor.

Mr. GEORGE TUCKER asked for a clearer definition in Rule 3 of the qualification for pensions. This stated that applicants must have been subscribers for five years, "and have been engaged in the electrical trade." This did not seem to exclude skilled labour, which he understood was the intention, and he could conceive circumstances under which a subscriber might, after all, find himself ineligible for assistance.

Mr. JUSTUS ECK having pointed out that no person, even though a subscriber, had a legal claim on the fund for assistance, it was decided to refer the matter to the committee for consideration.

A vote of thanks to Sir William Preece closed the proceedings.

Smoke Nuisance in London.—The Public Control Committee of the London County Council recommend that notice be given by public advertisement of the intention of the Council to consider, at its meeting on May 18th, 1909, a proposal that it shall take the necessary measures for promoting in the session of Parliament of 1910, legislation relative to the prevention of nuisance from smoke in the County of London, and to defray out of the county fund the cost and expenses of so doing.

Three Deaths by Electric Shock in Paris.—On Sunday evening, a boy of eight climbed over a palisade surrounding a number of bare wires conveying current at 6,000 volts, between the Saint Ouen Works and the Courcelles workshops of the Ceinture Railway in Paris. The boy climbed on to the supports, and, coming into contact with the wires, was instantly killed. Unfortunately, two young workmen, noticing the body twitching, attempted to drag it away, and were also killed immediately. The bodies were subsequently removed after the current had been switched off.

Wireless Telegraphy and Telephony.—Under this heading, on p. 400 of last week's issue, a note appeared to the effect that a French naval surgeon had reported several cases of affections of the eyes amongst wireless operators, attributing them to the action of ultra-violet rays from the spark. In connection with these statements, Mr. G. Marconi has written a letter to the *Times*, in which he states that in his own experience and that of the company nothing has occurred to support these suggestions. The company, he writes, have found it convenient, in their high-power stations, to enclose the spark-gaps in a box of an opaque material to protect the eyes of the operators from the intense light, but that the health of the operators has been uniformly satisfactory.

The new battleship *Temeraire*, now approaching completion at Devonport, is fitted with a wireless installation having a working radius of 1,000 miles. The instrument-room is below decks, so as to be more protected from the effects of gun-fire, and the aerial wires are caged in with a galvanised-iron wire-network to prevent the men from coming in contact with them.

The French Government has conferred a silver medal of the first class on Mr. J. Binns, who was in charge of the wireless installation on board the *Republic*, in recognition of his devotion to duty on the occasion of the collision with the *Florida*.

An experimental wireless station, with a mast 230 ft. high, has been erected by the C. Lorenz Akt.-Ges. in Eberswalde, on the bank of the Finow Canal, in Germany.

The Washington correspondent of the *Evening Standard* stated on Tuesday that a public wireless telephone system is in operation between Portland and the islands of Casco Bay, and has given every satisfaction. Four stations are said to be at work. The system employed is not stated.

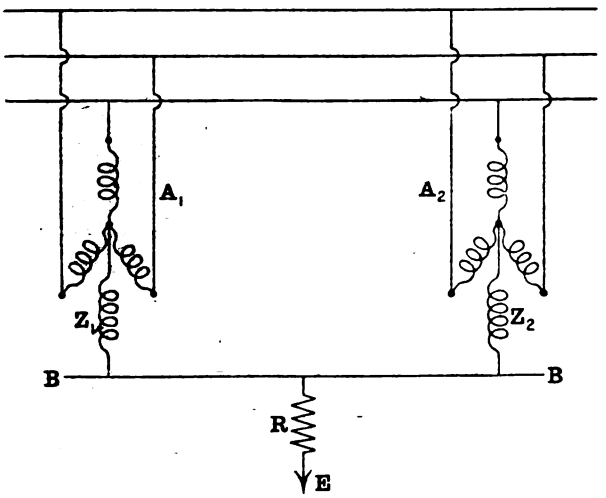
CORRESPONDENCE



PARALLEL RUNNING OF THREE-PHASE ALTERNATORS WITH EARTHED NEUTRALS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The automatic earthing switch described by Mr. J. H. Rider in his recent Paper before the Institution of Electrical Engineers, is a complicated and costly piece of apparatus. No one will regard its expense as too great if it really safeguards an important generating station, such as that at Greenwich, from a source of danger, while the fact that the switch has been actually designed and used will be accepted as conclusive evidence that such a danger exists. But it appears to me most questionable whether this apparatus is the best one to use for the purpose in view.

The effect of third harmonics in the phase voltages of star-connected alternators, with the star points all earthed, has been frequently pointed out. Mr. Brew, of the Dublin Lighting Station, first drew my attention to the matter several years ago, and showed me some oscillograms he had taken of the triple frequency earth currents occurring under such conditions. But so far as I know, no data of the voltages corresponding with these harmonics have been published in reference to any station, and I doubt whether such voltages have been ever actually measured. Oscillograms are very pretty things, but are useless for exact data; and until definite measurements are obtainable, I do not know that anyone can estimate the true importance of these harmonics, unless it be from actual experience of their effects.

I write this letter to make a suggestion which I

DR. SUMPNER'S SUGGESTED ARRANGEMENT OF CHOKING COILS.

believe is novel, and on which I should be interested to learn the opinions of others. The suggestion is that each alternator should have its star point connected to an earthing bar through a choking coil, and that the earthing bar should be well earthed through a low resistance of the usual kind. The sketch shows two star-wound three-phase alternators, A_1, A_2, earthed in this way, and parallel connected to the mains.

Z_1, Z_2 represent the choking coils, and R the earthing resistance.

Under these conditions, if the distributing system is insulated from earth, as will normally be the case, the resistance R will have no current through it, and the earthing bar B B will be at zero potential. The point is that each of the impedances Z_1, Z_2 will take a voltage representing the third harmonic voltage in the windings of the corresponding alternator, and will normally choke down any current these voltages tend to cause. Moreover, these choking coils will form essentially the only impedance in the path of the current caused by the third harmonic voltage. The three windings of each alternator are so joined up in parallel that they constitute a non-inductive resistance so far as the current of triple frequency is concerned, and hence, when two alternators are parallel connected with star points earthed in the ordinary way, it is possible for a third harmonic voltage of small magnitude to cause quite a large current circulating around the machines. It is probably owing to this fact that appreciable currents have been observed due to the third harmonic voltage, for if the windings of the alternator acted as a choking coil, the high impedance of this for currents of triple frequency would reduce any such currents to negligible magnitude.

In the absence of actual data I can only guess the magnitude of the voltage corresponding with the third harmonic. Let us assume there are three alternators in parallel, the first an ideal alternator with no harmonic in its voltage, the second an ordinary machine with a third harmonic voltage of, say, 2 per cent. of the phase voltage, and finally an abnormal machine with a third harmonic voltage of 10 per cent. of the phase voltage. Assuming the voltage from the star point to line is 5,000 volts, the three third harmonic voltages will then be 0, 100, and 500 volts. The ideal machine will have its star point at exactly earth potential, and can be joined direct to the earthing bar without using any choking coil. The choking coil for the ordinary machine will be subjected to 100 volts, while that for the abnormal machine will have 500 volts upon it. These voltages would cause very large currents through the machine windings were it not for the choking coils. With their aid the currents can easily be reduced to negligible values, while the voltages on these choking coils will indicate important facts about the alternators.

Now, without discussing details of the automatic earthing switch described in Mr. Rider's Paper, let us consider the results it secures. These appear to be three in number. In the first place, any alternator which is shut down has its star point disconnected from earth. No advantage is claimed for this result, and earth potential would appear to be the safest of all potentials for an unused machine. Again, only one acting machine is earth-connected at any given moment. The object of this appears to be two-fold. Heavy earth currents between two machines due to the third harmonic voltage are prevented. The choking coils now suggested seem to secure the same result in a simpler fashion. Another result of the switch is that if an earth occurs on one of the phases, only the alternator actually connected with earth is called upon to supply the short-circuit current, so that the "voltage of the whole station" can be maintained, "pending the opening of the time-limit circuit-breaker." But the choking coils here suggested could easily be designed to prevent serious earth currents, even in this case. The object of the earth-connection is to keep the neutral points of the alternators at earth potential, not to encourage leakage currents to earth. If it is desirable for one of the alternators to be available to force current through a fault, all that is needed is to connect the neutral point of its windings direct to the earthing bar, omitting the choking coil. So far as I can see, the arrangement of choking coils above suggested forms a simple and more certain safeguard than the automatic switch. The cost may possibly be as great, but in this matter safety is the first consideration. The choking coils can be made to give valuable information about the machines. They are approximately at earth potential, and the voltages or

D

Digitized by Google

currents they take might possibly be utilised to work safety appliances.

Someone may object that, according to the above figures, the star points of the generators, instead of being kept at earth potential, differ from it by 100 or 500 volts. But the choking coils are not the cause of this, and nothing can possibly alter it, except those heavy earth currents which the automatic switch is designed to prevent, or such changes in the structure of the alternators as will do away with the third harmonic voltages. These voltages exist on the various parts of Mr. Rider's automatic switch, and are only reduced to zero on that switch which is connected to earth by producing a corresponding shift in the value of the line voltage to earth.

I am,
Yours faithfully,
W. E. SUMPNER.

Technical School, Birmingham.
April 26th.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I have read with much interest the article by "A Dynamo Designer" on the question of earthed neutrals in star-connected three-phase alternators, and should like to add a few remarks on the question of the effect of harmonics in the wave forms.

Firstly, the fact that in a three-phase system any third harmonics in the E.M.F. waves are in phase with one another has only an indirect bearing on the question of local currents between the various machines. In an ideal case of two perfectly similar machines running in parallel there would be no resultant E.M.F. in the circuit consisting of two corresponding phase windings, the corresponding bus-bar and the neutral bus-bar—and this is true whether we consider the fundamental of the $(2n+1)$th harmonic in the E.M.F. waves; hence there would be no currents in the neutral bus-bar. But if there is any dissimilarity in *any* harmonics in the waves of the two machines, a local current will flow, so that this effect is not confined to harmonics of triple frequency.

Now, consider the case of two dissimilar machines running in parallel on an external circuit. As stated in your article, "It is a law of the three-phase circuit that a third or ninth harmonic cannot exist in the wave form of the E.M.F. between the lines," and, therefore, unless there is a star connection at the receiving end of the circuit with an earthed neutral point—say, on a set of transformers supplying rotary converters—there is no way by which triple frequency currents can flow in the line wires, and therefore there can be no such components in the currents leaving the bus-bars to the outside circuit. In the case of the fundamental—fifth, seventh, &c.—harmonics, the bus-bar P.D. is less than the E.M.F. of each machine by the amount of the impedance drop, and thus the current in each machine will adjust itself until balance is obtained. To take a specific instance. Suppose one machine has a larger seventh harmonic than the other; the seventh harmonic in the bus-bar P.D. will probably be less than that in either machine's E.M.F. wave, and the former machine will generate a larger seventh harmonic of current. In this case the neutral bus-bar will not be called upon to carry any local current.

But the case of the third, ninth, &c., harmonics is different. Here we can have no line currents to cause impedance drops, so that the resultant E.M.F. in the local circuit is free to expend itself in producing a local current circulating between the two machines; since, also, the three third harmonics in the three phases of each machine are in phase with one another, the triple frequency current in the neutral bus-bar will be three times that in each phase winding. We should therefore expect the triple frequency local current to be relatively much larger than the components of other frequencies, and if each generator has its three phases perfectly balanced it is probable that the local current will be entirely of triple frequency.

There is another effect which will tend to produce these local currents—unequal division of load between the various machines. In the case of a generator giving out current at unity power factor, the effect of armature reaction is to concentrate the field under the "following" pole tip, with a corresponding wave distortion. To take an extreme example, Figs. 1 and 2 are taken

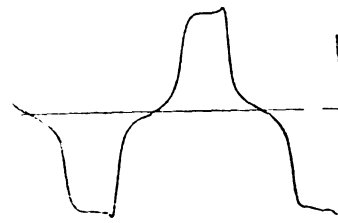


FIG. 1.

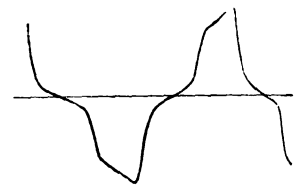

FIG. 2.

from one phase of a small 7-kw. three-phase machine with windings concentrated in one slot per phase per pole. Fig. 1 is taken at no load and Fig. 2 with a load of 10 amps. per phase (full load, 22 amps. per phase). Of course, in this machine no attempt has been made to produce even an approximation to a sine wave, and the third harmonic has a maximum value 31 per cent. of the fundamental; but the figures show how the wave is distorted with only a moderate amount of load. This being the case, unequal division of load will cause differences of wave form, which will result in local currents, principally of triple frequency, if the load be balanced on the three phases, since the wave forms of the various machines will no longer be similar.

With regard to Mr. O'Brien's experiences at the Formby station, is it not possible that the effect was due in some measure to the speed variation of the reciprocating sets in each revolution? The turbine set has no speed variation, and this would cause a slight swing of the load distribution, with the above result. It would also be interesting to know whether any precautions are taken at Deptford to synchronise the sets when the corresponding cranks are parallel, so as to prevent the oscillation of the load.

Yours truly,
F. J. DYKES.

Trinity College, Cambridge.
April 26th, 1909.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I have read with interest the article by "Dynamo Designer" in your issue of the 22nd inst. on the question of earthing the neutral point of three-phase alternators running in parallel. Where existing plants are found to give trouble owing to the presence of odd harmonics in the wave form of one or more of the generators causing heavy currents to circulate with the neutral points connected, the principle of earthing adopted by Mr. Rider, and described in his Paper, should form a practical and effective means of overcoming the difficulty. To reconstruct the pole-tips of several generators in a power station merely to accommodate the pure sine wave form of a new unit put down at a later date would seem a costly procedure, and, unless it could be clearly proved that the increased efficiency of the system generally with a sine wave form would pay for the reconstruction of the existing plant, I think that most station engineers would decide that the wave form of the new-comer must be made to conform to that of its seniors in office. With the arrangement adopted by Mr. Rider, when a dead earth occurs on one phase of the system outside the power station, a current passes through

Digitized by Google

the fault and corresponding phase winding of the earthed generator of such value that the fall of potential due to it across this winding is approximately equal to the pressure between one phase and neutral of the generator. Since the short-circuit current of a large alternator will generally not exceed by more than two and a half to three times the full-load current, it is obvious that for short intervals of time the winding of the generator will be quite capable of taking this short-circuit current without injury; thus the use of one phase winding to form a path for the fault current to earth seems a convenient method of keeping this current within reasonable limits. The impedance of the circuit, however, will vary somewhat according to the output of the generator whose neutral point happens to be earthed at the time the fault occurs, and consequently the maximum value of the current passing through the fault would probably not be kept within such a well-defined limit, as if a standard piece of apparatus permanently connected to the bus-bars was employed. In the case of a station employing large generating units it is possible also that the current required to actuate any one feeder relay might be much less than the short circuit current of any one generator. It would seem, therefore, that an auxiliary star-wound piece of apparatus with earthed neutral might with advantage be employed permanently connected to the bus-bars.

Yours faithfully,

WM. BREW.

Dublin, April 26th.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I have read "Dynamo Designer's" article with much interest, and I agree with him that the matter is of considerable importance. As regards the circulating currents between the machines, they are best dealt with, in my opinion, by earthing the neutral of one running machine, and this is effected most simply and sufficiently surely by providing an ordinary knife-switch on the switchboard for the neutral of each machine, and depending on the switchboard attendant to always keep one running machine's neutral earthed. Edison used to say, "the best automatic device ever invented was a good nigger." As regards a resistance between the neutral and earth, the advisability of inserting one depends on the system on which the distributing cables are laid and the total available power which may be fed into a short. If 20,000 to 30,000 kw. may be concentrated in a short in a manhole in a public street, or if cables lie adjacent to each other so that a short on one cable may damage another, then a resistance should certainly be inserted. In any case, time-limit relays are out of place on E.H.T. feeders; the sooner a short is cleared the better for the plant, the cables, and the generating station.

Yours faithfully,

H. E. O'BRIEN.

Formby, April 26th.

To the Editor of ELECTRICAL ENGINEERING.

DEAR SIR,—In reference to your interesting article of the 22nd inst., on the parallel running of three-phase alternators, it is no doubt true that in order to avoid the triple frequency currents to earth, the wave forms of paralleled machines should be the same. But is it not also necessary to have, in addition, every machine at the same excitation and the same proportion of load? Unless this is the case, the relative phase positions of the machines do not coincide, and triple frequency currents can circulate. On page 155 of Part 173, Vol. 35 of the *Journal of the Institution of Electrical Engineers*, the current wave form of an under-excited generator in parallel with similar machines is given. There is in that wave a very strong triple frequency harmonic which disappeared when the excitation was raised and the machine had quarter full load. Above this, the current had nearly a sine wave form. The suggested remedy of altering the pole-tips so as to give a sine wave on open circuit would therefore not be in itself final, for this machine had such a wave. It was running with earthed neutral.

Earthing through small spark gaps is not a satisfactory arrangement. Perhaps the simplest is to have an earthing switch on the neutral of each machine, connection being made to an earthing bus-bar either direct or through a resistance, the operation of earthing being part of the starting of the machine. Only one machine of those in parallel need be earthed at any time.

In high-tension systems with transformer sub-stations in which the primaries are star connected with the neutral insulated, and with the secondary windings also star but with earthed neutral, there is a further risk of circulating currents unless all the sub-stations are equally loaded. This is caused by the triple frequency hysteresis harmonic. With a bank of step-up transformers connected in this way, it might be well to connect all the insulated primary neutrals in order to prevent distortion of the primary wave form, and an increase of core loss, in any transformers standing idle or on light load.

Yours faithfully,

W. M. THORNTON.

Armstrong College, Newcastle-on-Tyne.
April 27th, 1909.

FIRE AT THE CENTRAL TECHNICAL COLLEGE

ON Monday, just before two o'clock in the afternoon, a fire was observed to have broken out in the Junior Chemical Laboratory on the top floor of the north-west wing of the City and Guilds Central Technical College at South Kensington. At the time of the outbreak the students were not in the laboratory, but before the fire had spread very much, it was observed by one of the demonstrators, and the College fire-brigade was immediately called out. Within three minutes from the time of the call four hydrants were at work, including two on the roof, but the construction of the roof was such that the burning material could not be easily reached. The lower part of the roof, where the fire broke out, is leaded, and above this is a glazed portion; finally a wooden superstructure carries a slate roof, below which is a tarred felt covering. The flames from the lower roof were drawn up between the plaster ceiling and the lead covering, and set the upper roof alight. In order to reach the burning wood and felt, it was necessary to break away the tiles, and after this had been done with the aid of the firemen who had by this time arrived on the scene, the fire was finally extinguished at about 4 o'clock. The fire was well under control long before this, however, and at no time was there any danger to the rest of the building, as the roof in question is not only the highest, but is quite isolated from the rest of the building.

At the time of the outbreak there were over four hundred students, and about one hundred other persons in the College, but although there was naturally some little excitement, there was no confusion, and the students' brigade worked splendidly. The origin of the fire is practically certain, as the ceiling is burnt away all round the chimney of a gas muffle-furnace which was working at the time. The chimney was surrounded with asbestos where it passed through the wood and plaster ceiling, but it is quite probable that the asbestos had fallen away, and that the chimney, getting red-hot, had set alight to the ceiling. The only serious damage done is that to the roof which will probably have to be entirely reconstructed; a considerable quantity of water flowed down the steps, and into the corridors, but this was guided down into the basement, and prevented from entering the other rooms by matting, &c. The electrical department, particularly, took great care to protect their cable trenches.

THE ELECTRICAL SYSTEM OF THE L.C.C. TRAMWAYS

A FULL report of the discussion on Mr. J. H. Rider's Paper upon the electrical system of the London County Council's tramway was published in our issues of April 1st, 8th, and 29th, and in the last of these, abstracts of the written communications were given. The following are abstracts of two communications which were received too late for inclusion in last week's issue:—

Mr. LEONARD ANDREWS (the Key Engineering Co., Ltd.) questions whether the abandonment of the original scheme providing for two generating stations more or less in the centre of the area of supply, for one larger station entirely outside that area but having the advantage of a waterside site, was justified. He admits that the results, so far as generating costs are concerned, are excellent, but suggests that these results are due to the very high load factor. With regard to the capital costs of generating stations, Mr. Andrews writes that, considering he was severely criticised in the discussion on his recent Paper before the Institution (see ELECTRICAL ENGINEERING, Feb. 25th, page 192), for assuming a total capital expenditure of £14 per kw. installed complete with cooling towers, and was told that if a riverside site had been selected instead of cooling towers the capital outlay would have been considerably less, it is somewhat surprising that Mr. Rider's actual capital outlay of £23·63 per kw. installed for riverside plant was allowed to pass without comment. Cooling towers for dealing with an output equal to that of the Greenwich station could have been erected complete for less than £30,000; and, taking interest and sinking fund at 7½ per cent., and adding 2½ per cent. for maintenance and repairs, the fixed charges on the cooling towers would amount to £3,000 per annum. Mr. Rider's expenditure on pier and river work has been over £60,000. The repairs on this might be covered by 1½ per cent. per annum, making a total annual charge of 8 per cent., or £4,800. The above item does not cover the capital cost of the strainers. With respect to the cost of the buildings, Mr. Andrews writes that at a certain riverside station the total cost of buildings had been £5·44 per kw. installed. Of this amount only £2·14 per kw. had been expended on the actual superstructure, the remaining £3·3 per kw. had been spent on costly foundations owing to the close proximity of the site to the river bed. Was Mr. Rider's high capital outlay of £9·82 on land and buildings attributable to this same difficulty? The ground space required for cooling towers of the capacity under consideration would be about 5,000 square yards. Assuming a ground rent of 1s. per annum, an additional expenditure of £250 per annum would be incurred under this heading. The power required for pumping the water to the top of the towers would be approximately 2½ million units per annum, and taking the cost of this current at 0·34d. per unit, the annual charge under this item would be £3,240. The extra make-up water evaporated from the cooling towers could have been obtained at Camberwell at a cost of less than 2d. per 1,000 gallons, and 28,000,000 gallons at 2d. per 1,000 equals £2,340. Mr. Rider's fuel consumption of 3·1 lbs. of coal per kw. hour, the calorific value of the coal being 12,000 B.T.U. per lb., corresponds to a thermal efficiency of 9·05 per cent. The fuel consumption at the Pinkston station of the Glasgow tramways undertaking is 3·05 lbs. per kw. hour, the calorific value of the coal being 12,000 B.T.U. per lb. The overall efficiency of the Glasgow plant is therefore 9·3 per cent., or 0·25 per cent. higher than Mr. Rider's. The load factor of the Glasgow undertaking is only 37·5 per cent., against Mr. Rider's 47·75 per cent. Mr. Rider has the supposed advantage of a plentiful supply of water at a low temperature, whereas the Glasgow undertaking obtain their water from a canal, the flow of water in which is very small. It appears, therefore, that any advantage in this respect must also be abandoned. The above items show on the whole some advantage in favour of waterside sites as compared with sites necessitating cooling towers, but it is necessary to consider the extra capital outlay on feeders with the extra transmission losses and the cost of converting that portion of the total current which would have been generated as direct current if the stations had been placed in central positions. It is understood that under the original scheme it was proposed to install 6,000 kw. as direct current, or 20 per cent. of the total plant installed. According to Mr. Snell, the difference in cost between E.H.T. current and direct current on a 50 per cent. load factor is 0·466d.—0·344d.; or, in other words, the cost of conversion, including capital charges, is 0·122d. per unit. The cost of converting 20 per cent. of 91,000,000 units will therefore be £9,250. From the above the advantages and disadvantages of a waterside site may be represented as follows:—The special charges in the case of the waterside site are in respect of the pier and river work, £4,800, being 8 per cent. of £60,000; and for converting E.H.T. to D.C. (18,200,000 units at 0·122d.), £9,250, making a total of £14,050. In the case of the other site, the figures are:—Cooling towers (10 per cent. of £30,000), £3,000; extra ground rent (5,000 square yards at 1s.), £250; pumping water (2½ million units at 0·34d.), £3,240; extra make-up water (28 million gallons at 2d. per 1,000), £2,340; leaving a balance of £5,220 in favour of the site with cooling towers, apart from the extra costs of transmission in the other case. It appears that at the time Mr. Rider started the Greenwich scheme there was little to choose as far as generating charges are concerned, between the respective systems. At the present time, however, it would be possible to put down gas-driven generating stations (one south and one north of the Thames) at a lower capital outlay than has been expended on Mr. Rider's scheme, and to guarantee that the total annual running costs should not exceed £60,000 for the output covered by Mr. Rider's running costs of £92,208.

Mr. E. P. HOLLIS writes with reference to the earthing of the neutral points of the three-phase generators, stating that the circulating currents were undoubtedly due to the third harmonics in the wave forms. Many engineers, he writes, prefer to have the earth circuit to the star point of as low an impedance as possible to facilitate the clearing of cable faults and for other reasons. In a Paper before the Newcastle Section of the Institution (see ELECTRICAL ENGINEERING, Jan. 24th, 1907, Vol. I., p. 147), the writer suggested two schemes for limiting the triple frequency currents. First, by inserting an inductance in the earth circuit, which would have three times the choking effect on the triple-frequency currents as on a current of the normal frequency. Secondly, by inserting into the earth circuit a capacity also, of such a value that resonance is obtained with the normal frequency, *i.e.*, so that $pL = \frac{1}{pK}$. The impedance of this combination to short-circuit currents of normal frequency will be zero, but to triple-frequency currents the impedance will be $3pL - \frac{1}{3}pL$, or $\frac{8\ p\ L}{3}$. In this manner the impedance to the triple-frequency currents can be raised to any desired value without introducing any choking effect on currents of normal frequency.

A communication was also received from Dr. W. E. SUMPNER which embodied the same conclusions which he has expressed in a letter in our correspondence columns.

German Patents.—The annual report of the German Patent Office shows that the number of applications for patents in the year 1908 was 40,312, as against 36,763 in 1907, but that the number of patents granted has fallen from 13,250 in 1907, to 11,610 in 1908. The number of patents in force at the end of the year was, for the first time since the institution of the office in 1877, less than that of the previous year, namely, 40,135, as against 40,184 in the year 1907. Of the applications during 1908, the class of electrotechnics heads the list with 2,721, as against 2,638 in 1907. Only 3·4 per cent. of the patents granted in 1893 reached the maximum life of fifteen years: it will be remembered that of the British patents granted in 1894, 3·8 per cent. were maintained for the full period of fourteen years. An abstract of the report of the British Office was given in ELECTRICAL ENGINEERING of April 22nd, page 562.

Electric Miners' Lamps.—In a Paper read before the Midland Counties Institution of Engineers recently at Nottingham, and reported in the *Colliery Guardian*, Mr. W. H. Mills summed up the advantages of electric miners' lamps over oil lamps as follows:—Dr. Court found that of 500 men working with oil safety lamps, over 100 were suffering from nystagmus, and that only three men out of 500 were affected where naked lights were used, showing that constant straining of the eyes owing to deficiency of light is the cause of the disease. The use of electric lamps, with the increased illuminating power, will undoubtedly reduce the number suffering from this serious malady. For examining the roof in the working places and roadways, the electric lamp has the advantage of the light not being affected by being tilted in any direction, and there is no doubt that with this advantage and the better light accidents from falls of stone will be reduced when electric lamps can be used. The electric lamp is a necessity for use with life-saving apparatus, but the lamps now in use are not altogether satisfactory. At the present time there is a serious loss of working time caused by the oil lamp being so easily extinguished, and with the shortened hours of labour this loss of time will be still more serious. Electric lamps have not this disadvantage. It must also be admitted that even with the ingenuity expended on the manufacture of the safety lamps, and with the great care exercised in cleaning, locking, and in the use of the lamp, there is still an uncomfortable feeling that a defective lamp, or the wrong use of a lamp, may be the cause of a serious explosion of fire-damp and coal-dust; and, now that such high velocities of air are usual, and most of our deep mines are dry and dusty, a load of anxiety will be removed from the over-taxed colliery manager if a still safer lamp than the oil lamp can be found. It therefore behoves everyone who is interested in coal-mining to do his utmost to improve the miners' safety-lamp.

A 12,000 AMPERE-HOUR BATTERY FOR MANCHESTER

A CONTRACT has been placed by the Manchester Corporation Electricity Department for a battery to be installed at the Dickinson Street generating station, which is interesting, not only as being probably the largest storage battery yet put down in this country, but also on account of the way in which it is designed to effect economies by being employed partly on the lighting and partly on the traction load. Through the courtesy of Mr. S. L. Pearce, Chief Electrical Engineer to the Manchester Corporation and of the Tudor Accumulator Co., who have been awarded the contract, we are enabled to give a few particulars of the battery and the way it is to be used.

Speaking generally, the intention is to use the surplus power from the traction generator available in the day time for charging up the battery, at a cost very little more than that of fuel, and discharging the battery over the lighting peak and traction peak. It is probable that it will be called upon for two complete discharges per day, so that the service will be rather severe.

The contract includes the supply and erection of the battery, and also the boosters in conjunction with which it will work, and the original specification also included the necessary switchgear. The contract for the switchgear, however, has not been let as yet, and a new specification for this part of the work is to be issued, as some modifications in the arrangement have been determined upon.

The battery will consist of 210 cells in series, and is to maintain with one of the boosters a voltage of 450 across the lighting bus-bars. When required for traction service two of the boosters will be run in series. Charging will be carried out from the 525 volt traction bus-bars under the conditions outlined below. The following discharge rates are guaranteed:—8,400 amperes for 1 hour, 5,000 amperes for 2 hours, 3,900 amperes for 3 hours, and 11,200 amperes for half an hour. It is further to withstand a maximum discharge rate of 15,000 amperes. The normal charging rate is to be 4,100 amperes, and the maximum charging rate 6,500 amperes. The containing cells are to be of pine wood, lead lined, coated inside and out with acid-proof paint. The outside measurements of each cell will be 6 ft. 1½ in. long by 2 ft. 2½ in. wide by 3 ft. 4½ in. deep, and the dimensions of the plates, which will be cast in one piece, will be 20¾ in. by 29 in. The weight of each cell will be about three tons, and the total floor space occupied by the battery will be about 5,800 sq. ft.

The boosters will be supplied by the Lancashire Dynamo and Motor Co., Ltd., and, as already mentioned, will be three in number and of the reversible type. Each set is to consist of a motor driving one booster. The boosters will be separately excited, and are to have laminated field systems to allow of rapid reverse.

Each motor is to be capable of driving the booster at all loads when running off the traction 525 volt circuit, or the lighting 425/450 volt circuit.

The capacities of the boosters are specified as follows:—2,800 amperes at 100 volts for 15 minutes; 2,000 amperes at 80 volts for 4 hours; 2,800 amperes at 60 volts for 1 hour; 3,700 amperes at 80 volts for ½ hour. The boosters, when the battery is on the lighting load, will be connected one, two, or three in parallel, according to the load, separately excited off the bus-bars and hand regulated; but when the battery is on the traction load two of the boosters will be used connected in series. One of these will be excited from the traction bars and hand regulated, and its object will be simply to give a constant boost equivalent to the difference between the lighting and traction voltage. The other booster will be arranged so that its field is regulated automatically in order to cause the battery to take up the fluctuations of the traction load, and thus render it possible for the traction generators to run on a practically constant load. The differential windings by which this automatic regulation is effected will not be on the booster fields but on special exciters provided for the purpose. These exciter sets, of which two will be provided, one serving as a spare, will be driven independently by their own motors.

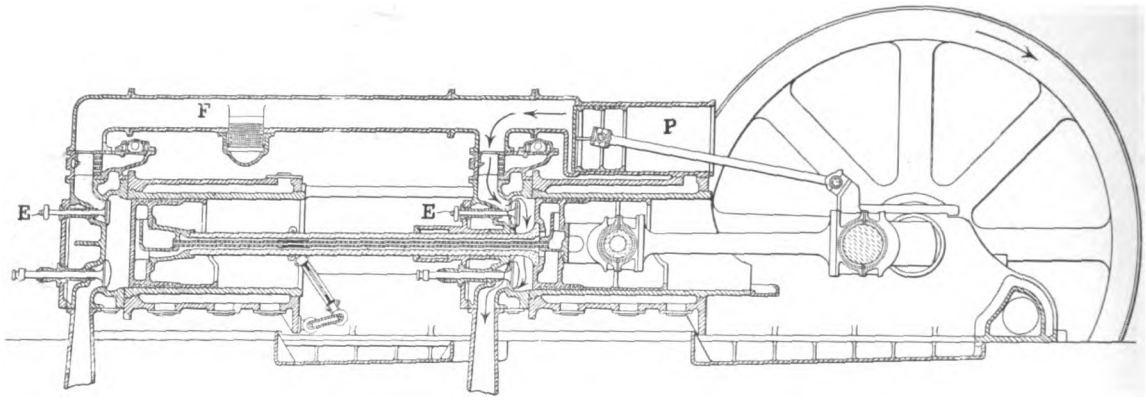
The Tudor Company are entering into a contract to maintain the battery at 100 per cent. of its rated output for a period of fifteen years.

LARGE BRITISH-MADE GAS ENGINES

AN impression exists to a great extent amongst engineers that the design and manufacture of gas engines of large size is carried on almost exclusively abroad, more particularly in Germany. The Premier Gas Engine Co., Ltd. (of Sandiacre, near Nottingham), have called our attention, however, to a number of gas engines of large size which have been designed and built entirely in this country, and are certainly not inferior to the excellent German engines, descriptions of which have been published in the electrical Press from time to time. Another commonly existing idea is that gas-producer plants, particularly those using bituminous fuel, are fearful and wonderful things, which never run without giving trouble, a misconception which the success of the examples cited below should go far to dispel.

It will be remembered that we recently referred in our columns to an installation of large engines of this firm at the rolling mills of Messrs. Alfred Hickman at Bilston (ELECTRICAL ENGINEERING, April 1st, page 306). The engines in this case run on blast-furnace gas. Eight drive generators for electric power supply. Three of these are of the single tandem type for 400 h.p., driving through ropes, and the other five are for 500 h.p., and are coupled directly to the generators. There are also in the same works two gas-driven blowing engines, one of the single tandem type for 1,000 h.p., with blowing tub coupled to back piston, and the other a double tandem horizontal 2,000 h.p. engine, with vertical blowing tubs. Further engines now on order for driving electric generators include one 500 h.p. and three 1,000 h.p. single tandem engines. These engines will also run on blast-furnace gas.

The above engines are mostly of the single tandem two-cylinder positive scavenging type, of which a typical section is given in the illustration on p. 416. The ordinary four-stroke cycle is used, and the operations occur alternately in the two cylinders in a sequence such that there is no reversal of pressure on the connecting-rod bearings. To effect the scavenging action, the admission valve is opened towards the end of the exhaust stroke, and air compressed in the passages behind this valve flows into the combustion chamber or clearance space, driving out before it, through the exhaust valve, the products of combustion resulting from the previous explosion. The air for scavenging is compressed to a pressure of about 3 lbs. per sq. in. before the opening of the valve *E* by a pump *P* placed above the engine, and operated from the main crank by means of a rod jointed to the big end of the connecting rod. After the admission valve *E* opens, the pump piston continues its motion and keeps up a steady flow of air, and this action is continued till the crank has passed the dead centre and the suction stroke has been commenced. The exhaust valve is now closed, and the pressure in the air pipe having fallen below atmospheric pressure, air is drawn through an inlet valve *F*, part of this air passing to the motor cylinder and on its way mixing with the gas admitted by a separate valve, and part going to the scavenging air pump, the piston of which is also moving forward.



E

Digitized by Google

The company claim very great advantages for the completeness of the scavenging in the directions of less risk of pre-ignition, back firing, and other troubles, a cooler mixing giving more power, and, in general, much improved thermal efficiency.

In large gas engines the springs usually employed for closing the heavy valves used have given considerable trouble from breaking, a broken spring generally causing a shut down. In the Premier engines this trouble is obviated by providing for the positive closing of the admission and exhaust valves which have a constant stroke, and by the use of four springs to close the gas valve, whereof three are sufficient for the purpose and any of them may be readily replaced while the engine is at work. The system of governing consists in varying the amount of gas in the charge down to a certain limit where ignition becomes uncertain and below that by missing the gas charge altogether. The gear is such that the point at which the hit and miss comes into play may be easily changed.

A still more interesting pattern is the double tandem engine, which we will describe in greater detail. Two engines of 1,000 h.p. of this type have been running at Messrs. Pilkington Bros., St. Helens, for some years. They also have one 500, one 300, and one 250 h.p. engine of the Premier Co.'s make, all coupled to generators. All Messrs. Pilkington's engines are running on bituminous producer gas, and it was in regard to producer gas that such doubts were expressed as to the reliability of gas engines at the recent discussion at the Institution of Electrical Engineers.

Section of Premier Single-acting Tandem Scavenging Type Engine.

This form of engine has four cylinders, and consists essentially, therefore, of two tandem engines of the type already described, arranged side by side, and driving cranks set at 180° to each other. The whole of the valves for all four cylinders are, however, driven by a single cam shaft, and the air pump is arranged horizontally above the forward cylinder. Practically the same scavenging arrangement is used. On the forward stroke the main piston and the air pump move forward together, and air flows in through an automatic inlet valve of very large area, a portion going direct to the pump, and the remainder through a mechanically-operated valve to the working cylinder, the charge of gas passing in at the same time through an automatic gas valve. The air, it should be noted, is drawn through a silencer containing filtering material, which prevents dust entering the cylinder.

The main inlet and exhaust valves are both arranged on the cylinder cover, and are readily accessible for examination or removal through a door bolted into place. The valves move horizontally, and when they are closed, the inner surface of the cylinder cover presents an even surface, having no projections likely to get hot and cause pre-ignition, nor pockets exposing additional surface for the abstraction of heat from the charge. Spiral grooves in the cams operate these valves, which are accordingly both opened and closed with a positive motion. To facilitate the examination of the pistons and the cleaning or replacement of the rings when required, a shoe is cast on the liner of the forward cylinder of each pair. On disconnecting the crank, the pair of pistons can be drawn forward clear of the cylinders, in which case the forward piston is supported by this shoe, and the rear one by the piston rod. No lifting and lowering of heavy weights is therefore required in performing this operation, the pistons being merely slid into position. Both pistons and exhaust valves are water-cooled, the supply for the former being conveyed to the hollow piston rod by swinging links attached to the rod at a point between the cylinders.

The cylinder liner is of simple cylindrical form, and is accordingly made of very hard metal. The cylinder proper is also a simple casting, and doors are provided giving access to the jacket space for the cleaning out of any deposit from the cooling water. In a similar manner a door is provided on the cylinder covers by which the water space in them can also be cleaned when required. Owing to the simple form of cylinder and liner, strains arising from unequal cooling in the mould, or unequal expansion in working are avoided, and both cylinder and liner are fitted so as to be capable of free expansion longitudinally.

Electric ignition plugs are fitted in duplicate to each cylinder. The engine is designed to work with producer gas, the compression being 140 lbs. per sq. in., and with this no trouble whatever in the way of pre-ignitions is experienced. This compression is more than sufficient to balance the negative acceleration of the piston on its in-stroke, and as there is a compression at every in-stroke in one cylinder or the other, the connecting rod is kept in constant thrust, thus relieving the big end bolts of all stresses save those due to screwing up. The air cylinders being of small dimensions, and the compression in them low, absorb little power, so that on test a mechanical efficiency of 87 per cent. has been realised.

A special feature of these engines is their accessibility. Continental designs are commonly double-acting, a practice which involves the removal of the cylinder covers before it is possible to gain access to the pistons for cleaning. In many cases, too, the exhaust valves are most inaccessible, being placed below the cylinder so that they can be reached only by a tunnel underneath the engine. With single-acting engines no arrangement of this kind is necessary. The pistons can be got at without breaking any joints, and as the back covers do not require to be removed once they are in place, there is no objection to placing in them both the inlet and outlet valves. In its turn this leads to the use of simple forms, easily cast and machined for the cylinder and liner. It is for these reasons that the company have so far decided to keep to the single-acting engines, the greater compactness of the double-acting type being, in their opinion, dearly purchased by the enhanced difficulty of maintaining the engine in proper running condition.

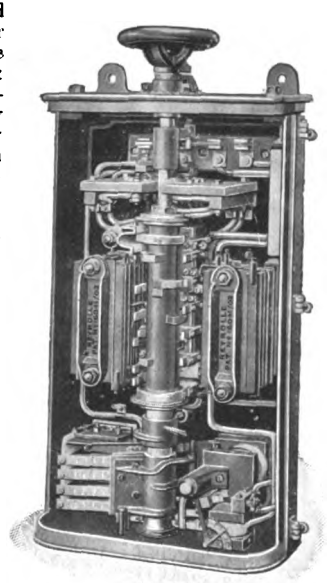
A "SIMPLEX" PAVILION AT THE "WHITE CITY"

In order to popularise the name "Simplex" in connection with metal filament lamps, electrical cooking, heating and ventilating apparatus, and other electrical goods sold by

View of "Simplex" Pavilion.

Simplex Conduits, Ltd., the firm are erecting a model electrical home at the Imperial International Exhibition which opens this month at Shepherd's Bush. The illustration shows the exterior

Digitized by Google



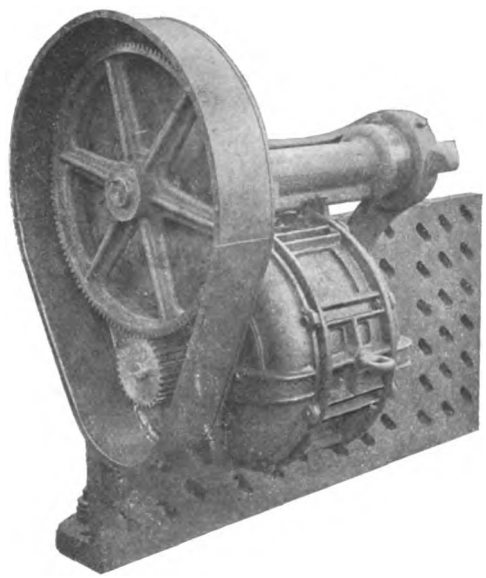
of the pavilion, which will occupy a site situated between the Garden Club and the Grand Restaurant in the Elite Gardens, the space covered being over 1,000 square feet. In addition to a large show-room, there will be an electrically equipped dining-room, drawing-room, bedroom, and kitchen, with the object of bringing before the public notice the various domestic applications of electricity.

In order to secure the maximum advantage from this undertaking, it will be unavoidable that a certain number of transactions will take place with the general public. As this is a departure from the policy which the company have always pursued of dealing only through the contractor, this matter has received some consideration, and as evidence of good faith the directors have decided to pay into the Central Fund of the National Electrical Contractors' Association 5 per cent. upon the gross value of all sales effected at the exhibit. The company feel themselves unable to offer a larger percentage than that named, owing to the heavy expenditure involved in the scheme. At the same time their enterprise in this direction cannot fail to be to the ultimate advantage of the electrical contractor, so that the Association receives a further indirect advantage.

DOUBLE REVOLUTION DRUM TYPE STARTERS

THE extending use of variable speed continuous-current motors, and the perfection to which these are being brought, has given rise to a considerable demand for suitable starting and regulating apparatus, and with a view to supplying gear equal in excellence to the motors, Messrs. A. Reyrolle & Co., Ltd., of Hebburn, Newcastle-on-Tyne, have recently put on the market a new pattern of double revolution drum controller, which contains some interesting features.

This starter, which we illustrate, is a modification of the firm's well known drum type controller, with the addition of a shunt regulator interlocked with the starting handle in such a way that it is impossible to start up the motor on a weak field. In using a starter of this description, the operator waits on the first stop until the motor starts, after which he completes the first revolution of the handle, thus cutting out the series resistance and bringing the motor up to its normal speed with full field. A further slight motion of the handle completely short-circuits the starting resistance, and at the same time makes the necessary connections between the field coils and the shunt-regulator portion of the apparatus.



Reyrolle Double Revolution Controller for Variable Speed D.C. Motors.

Further motion of the handle simply puts resistance in the shunt circuit, and raises the speed in the ordinary way. It will thus be seen that there is only one handle to operate, and it is practically impossible to make a mistake in operating this gear. Each starter is fitted with an overload and no-voltage release, and a push-button attachment for stopping by hand. The firm's well-known "Wait-on-the-first-stop-until-the-motor-starts" resistance is also included in the starting circuit. The mechanism is cleverly arranged, and the controller forms, in a compact iron case, a combined starting and regulating switch.

Electric Railways in Canada.—According to *Canada*, a Blue Book recently issued at Ottawa by the Department of Railways states that there were 992 miles of electric street and other railways in operation at the end of last June, the longest of which, in British Columbia, totals 79 miles. The mileage has doubled since 1901. The record of the fifty-three lines for 1908 is as follows:—Paid-up capital, $87,903,231; gross earnings, $14,007,049; operating expenses, $8,695,880; net earnings, $5,311,170; passengers carried, 299,099,309; freight carried, 732,475 tons. The Montreal Street Railway shows $3,736,620 gross, and $1,565,858 net earnings, and an operating cost of 58·09 per cent. of gross earnings. Toronto Street comes next with $3,609,218 gross and $1,633,879 net earnings, and an operating cost of 54·73 per cent. of the gross earnings. The total paid-up capital, subsidies, &c., has increased in seven years from $39,076,018 to $87,903,231; yearly gross earnings from $5,768,283 to $14,007,049; and net earnings from $2,333,120 to $5,311,170.

BACK-GEAR FOR SMALL MOTORS

IN some applications of electric driving it is necessary to have considerable speed reduction between the motor and the driven machine, and also to have the whole as compact as possible. A positive drive is also sometimes essential. These conditions are fulfilled by using spur-wheel reduction gear, which is more compact than a belt drive, and more efficient than worm gearing. The British Thomson-Houston Co., Ltd., of Rugby, have developed a special method of applying back-gear to small motors, which necessitates no alteration to the motor itself other than fitting a pinion to the shaft and two dowel pins in the feet. The device consists essentially of a strong cast-iron cradle, to the base of which the motor is bolted. Two brackets, one at each end of the cradle, support a bearing housing for the countershaft, and a sheet-iron case to enclose the gear wheels. The base of the cradle is machined flat above and below, so that the motor can easily be set with its shaft exactly parallel

B.T.-H. Back-gear Applied to Small A.C. Motor.

to the countershaft, and the outfit mounted on slide rails when used in connection with a rope or belt drive. To ensure accurate alignment, the countershaft bearing housings are made in one piece, and can be rotated in the cradle brackets to allow of the cradle being fixed in various positions. The motor end shields can also be rotated, so that the whole can be mounted on floor, ceiling, or wall, and in the latter case the motor may be either above or below the countershaft. The cast-iron bearings for the countershaft are lubricated by means of oil rings, and fitted with oil overflows and drain plugs. To ensure smooth working and long life, the teeth on the cast-iron gear wheels and steel pinions are accurately machined. Black fibre packing pieces are interposed between the gear case and the cradle, and reduce the noise to a minimum. The side of the gear case can readily be removed for inspection of the wheels without disturbing any other part of the equipment. These back-gear cradles are made in different sizes, suitable for both continuous- and alternating-current motors.

Copper Mining in Russia.—A British Consular report, dealing with the trade of Batoum during 1908, states that copper mining made but little progress in the direction of healthy development. It is reported that a new British company is about to start on a copper enterprise in the province of Batoum, but it has not yet actually set to work. The Caucasus Copper Company, Limited, which started mining copper at Dzansoul about eight years ago, is still in difficulties with the large magnetic-concentration plant which it has erected on its property in the Morgul Valley, province of Batoum. The peculiarities of the ore prevent it from being treated by the magnetic process, and the company has recently been compelled to revert to wet concentration. According to the most recent statistical information to hand, it would appear that there were 14 copper mines and smelting works in the Caucasus during the year 1908, and although data as to their individual or combined output is lacking, to judge from figures relating to 1906 and 1907 they produced close upon 112,903 tons of ore, which yielded, at a rough estimate, nearly 4,838 tons of copper. Besides the foregoing, eleven private copper enterprises are in existence in the Caucasus. The total combined output of these mines during the year 1908 was about 2,793 tons of ore, which quantity was, however, not converted into copper in view of the absence of smelting works at these mines.

AUTOMATIC TIME SWITCHES

THERE is no doubt that a well-lighted shop window is an excellent advertisement, and already many shopkeepers, realising this, leave their window lights on for some time after closing hours. In the case of a large establishment the duty of switching off is left to the night-watchman, but in smaller shops, which are left to themselves, an automatic device is necessary. Messrs. Marsh, Son & Co., Ltd., of 15 Gerrard Street, Soho, London, W., have recently put on the market two new patterns of automatic switches to fulfil this purpose.

The first of these, illustrated in Fig. 1, is very simple in its operation, and, though it necessarily involves a clock mechanism, is not a delicate piece of apparatus, but will stand a large amount of rough usage. It comprises a pivotted switch, which is closed by hand, and opened at any predetermined time by the action of the rotating dial. The clock mechanism is made by the British United Clock Co., of Birmingham, and is an eight-day double-spring open-escapement movement. It has been usual to enclose these switches to prevent tampering with the mechanism, but in this pattern the whole of the mechanism can be inspected by opening the lid of the containing box, and this renders it easier to blow out any dust that may have entered the mechanism. The switch is a single pole switch, and is put in series with the lamps to be controlled. To close the circuit, the cord hanging from the case is pulled, and the hook on the end of the switch arm engages with the catch, as can be seen from Fig. 1. The arm marked "off," which is turned with the dial, is held by the notch on the periphery of the dial corresponding to the time at which it is desired the lamps should be switched off. There is a notch for every

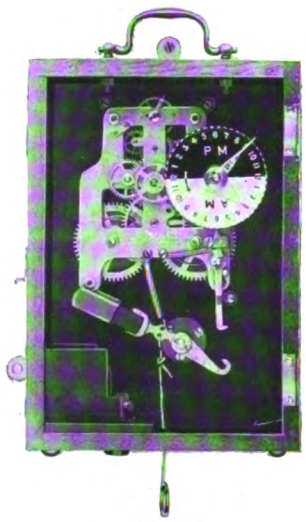

FIG. 1.
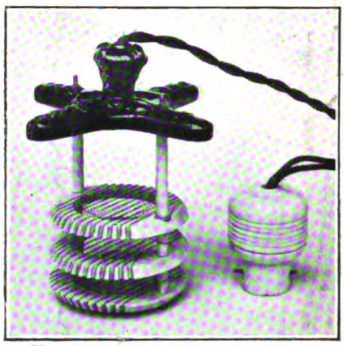
"OFF" SWITCH.

FIG. 2.
"OFF" AND "ON" SWITCH.



THE NEW "Z" AUTOMATIC SWITCHES WITH COVERS REMOVED.

half-hour. The levers are so arranged that the force needed at the end of the "off" arm to trip the switch is very small, and there is no chance of the clock stopping and the switch failing to act. The previous switches made by the firm had two clockwork movements, the second one opening the switch on being released by the first. The switch will comfortably carry and break any current up to 20 amperes at 250 volts, and has been worked successfully on a 500 volt circuit. This switch can also be used in conjunction with electric signs, and for switching off lamps at day-break, as, for example, the lamps left on in business premises and banks to enable the police to see inside at night.

The second pattern of switch is illustrated in Fig. 2. This is provided with two adjustable arms, and automatically switches "on" and "off" at predetermined times. The switch in this case, is in the form of a pivoted arm with a blade at each end; these blades enter contacts which can be seen in the photograph of Fig. 2. The arm tends to rotate, under the influence of a spiral spring, alternately making and breaking the circuit, but a star-shaped cam engages with the ends of a lever and prevents this movement. The lever is held against a stop on one side, but when one of the dial arms comes round it is caused to move in the other direction, with the result that one arm of the cam is allowed to pass. This either opens or breaks the circuit, according to which position the switch was in before the movement. The circuit is made and broken in half a revolution of the cam. As the dial rotates very slowly, and as it is necessary that the switch should rotate only a quarter of a revolution, it was necessary to ensure a very quick release of the lever, and this has been accomplished by the use of special spring catches on the end of the arms. When setting the switch, it is necessary to turn the dial round counter clock-wise until the true time of day is indicated on the dial by the fixed pointer. The two arms are then set to the times at which it is desired that the switch should operate, and the switch will be closed and opened respectively when these arms come opposite the fixed point. The main clock mechanism and also the switch spring are wound up once a week.

NEW HEATER FOR SMALL QUANTITIES OF WATER

A VERY simple and most efficient form of electric heater for warming up or boiling small quantities of water or other liquid, has recently been put on the market by Messrs. Stephan & Co., of St. John's House, 124/7 Minories, London. As can be seen from the accompanying illustration, the heater consists of three porcelain rings, spaced about an inch apart, and fixed by means of two metal rods enclosed in porcelain tubes, to a support also made of porcelain. The extending arms of the support rest on the edge of the glass or other vessel, which contains the liquid to be heated. The porcelain rings are notched to receive the heating wire, which is wound over the rings, the three portions being connected in series, and current is led to the wire by means of the twin flexible, which is connected to the ends of the two metal rods. The heating wire itself is made of a special non-corrosive alloy, and the two ends are connected to the rods at the top and bottom rings.

ELECTRIC HEATER FOR SMALL QUANTITIES OF WATER.

The apparatus is fitted with a porcelain adapter, which enables the current to be taken from a lamp pendant; it is necessary, however, to make sure that the circuit and fuses will stand the current taken, which is much more than that taken by a lamp. Thus a heater for a 120-volt circuit takes 5·2 amps.; this size has only two wound porcelain rings. The 220-volt size takes 5·4 amps., but will heat up a much larger quantity of water. The apparatus can be also obtained for any other pressure between 50 and 220 volts. In consequence of the fact that the heating element is in direct contact with the liquid, the efficiency obtained is the maximum possible, and the energy consumption is less than that of enclosed electric heaters, as hot-plates, where a large amount of heat is lost by radiation. The action is very rapid. One pint of water can be brought to boiling point in two minutes, the cost, at ordinary charges for current, being only a fraction of a penny. The apparatus is quite safe to handle, as all the live parts above the heating grids are enclosed in insulating material. It can be used in a kettle, tea-pot, breakfast cup, tumbler, shaving-mug, or any other vessel of suitable size. The wire must be totally immersed in the liquid before the current is switched on, as otherwise it becomes red-hot and may oxidise; the current must also, of course, be switched off before the apparatus is removed from the liquid.

Arc Works Engineering Society.—The annual general meeting of this society, the members of which are employees of Messrs. Crompton & Co., of Arc Works, Chelmsford, was held on Friday, April 23rd, Mr. A. J. Hodgson taking the chair. Colonel R. E. B. Crompton, C.B., was again elected President of the Society, and Messrs. B. Gibson, L. H. Hanbury, H. Stevenson, J. Trotter, and C. F. Tufnell were elected Vice-Presidents. The committee for the coming session are Messrs. A. J. Hodgson, H. Burge, C. Crompton, J. C. Macfarlane, C. H. Wright, W. J. F. Freeland, J. G. Murray, W. H. Denson, L. P. Jackson, L. O. Monson, H. W. Trefusis, and C. G. Willett. It was announced that the premiums offered by Messrs. Crompton & Co. for the best Papers read by juniors before the Society had been won by Mr. W. A. Page (pupil), Mr. S. Doig (apprentice), and Mr. E. C. Harris (apprentice). The conversazione which followed the annual general meeting as usual was a great success, the musical programme provided by members of the Society being particularly appreciated. Numerous experiments and demonstrations were carried out during the interval. One of the most interesting items of this part of the programme was an exhibit of X-rays and high-frequency apparatus shown working by Messrs. Harry W. Cox & Co., and a simple experiment on the formation of vortex rings, by Mr. E. A. N. Pochin, was also a great success. The membership of the Society now numbers 147.

MEASUREMENT OF INSULATION OF A LIVE THREE-WIRE SYSTEM

THE Institution of Electrical Engineers has accepted, for publication in their journal, a communication by Dr. Gisbert Kapp and Dr. Dennis Coales, in which some new methods of testing the insulation resistance of a three-wire network during working are described. These include a method which can be applied to ascertain the individual fault resistances of the three mains.

Method 1.—In Fig. 1, *a b* represents a potential slide, the resistance of which need not be known. The ends are permanently connected to the outer wires 1, 2, and the slider is connected through an ammeter A to earth. The middle wire is connected through a voltmeter V of resistance ρ to earth. R is the usual earthing connection with its ammeter A_0. To measure the total fault resistance, push the slider into such a position that A reads zero, and note the reading of V which will be called *e*. Then push the slider into such a position that V reads

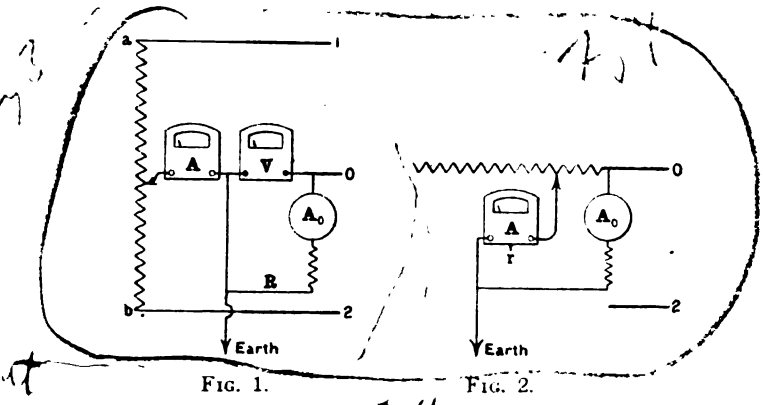

FIG. 1.

FIG. 2.

zero, and note the reading *i* on A. The fault resistance is then—

$$f = \frac{e}{i - \frac{e}{\rho}}.$$

Method 2.—The middle wire has, besides its usual earth connection, a connection with a graduated resistance with sliding contact, and the latter is connected to earth through a low-reading milli-ammeter (Fig. 2), say, of 1 ohm resistance. To make a test set the slider so that the pointer of the ammeter reads a little under half its total range, and note the corresponding resistance in circuit between the slider and middle wire. Let this be ρ and the current *i*. Then shift the slider so as to reduce the resistance to such a value ρ_1 that the current is exactly doubled. This will bring the pointer to near the end of the scale. Thus both currents can be read with great accuracy. If *r* is the resistance of the ammeter the combined fault resistance is—

$$f = \rho - 2\rho_1 - r.$$

The proofs of these two formulæ, which are simple, are given in the original communication.

Method 3.—Since all the methods for finding the fault conductivity proposed up to the present give the sum of the conductivities, it is obviously hopeless to try separating them by

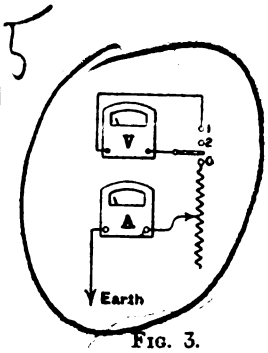

FIG. 3.

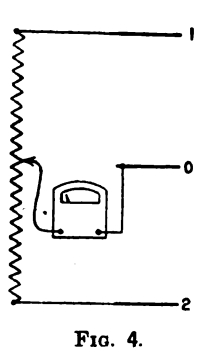

FIG. 4.

the use of additional artificial faults. The authors therefore follow the suggestions made by a German writer a few years ago, and introduce a new element into the test, viz., a slight variation of the difference of voltage between the two sides of the system. The Board of Trade allows a variation of ±4 per cent. in the voltage at the station. Thus if normally the consumer's voltage is 250 on each half of the system, it will be permissible to adjust by means of the regulating cells or the balancing set the voltage to 240 on the positive and 260 on the negative side, and then change the difference so as to get 260 on the positive and 240 on the negative. Fig. 3 represents the apparatus used for the purpose. The outer wires are connected to the terminals 1, 2, and the middle wire is connected to *o*. V is a voltmeter capable of reading the pressure between the two outer wires. It is provided with a switch so that it may also be used to measure the pressure between one outer (say, the wire 1) and the middle wire. A is the low-reading ammeter used in connection with the test according to method 2 described above, but its series resistance is not altered during the test. The pressure between the two outer wires is kept constant, but the voltage on one side of the middle wire is increased, and on the other side decreased by 8 per cent., as explained above. If K is the combined conductivity of the three faults and the ammeter with its series resistance, if E_1 and E_2 are the original voltages on each side of the system, and E_1' and E_2' the altered voltages, then the conductivities of the three faults will be as follows, *c* applying to the middle wire :—

$$c_0 = c - K\frac{e - e'}{E_1' - E_1},$$

$$c_1 = K\left(\frac{E_2}{E}\frac{e - e'}{E_1' - E_1} - \frac{e}{E}\right) \quad \ldots \quad \ldots \quad \ldots \quad (1)$$

$$c_2 = K\left(\frac{E_1}{E}\frac{e - e'}{E_1' - E_1} + \frac{e}{E}\right) \quad \ldots \quad \ldots \quad \ldots \quad (2)$$

E is the voltage across the outers, *e* and *e'* are the voltages between the middle wire and earth, and *c* is $c_1 + c_2 + c_0$, known from the test made according to method 2.

The test need not be made at the switchboard, but can be made at any point on the system. The authors point out that the two instruments may be fitted up in the engineer's office, and all that is required is to give the switchman instructions to shift the voltage between middle wire and outers by a slight amount. It is not necessary that the difference should be exactly 4 per cent., anything between 3 and 4 per cent. is sufficient for an accurate test, but it is important that the

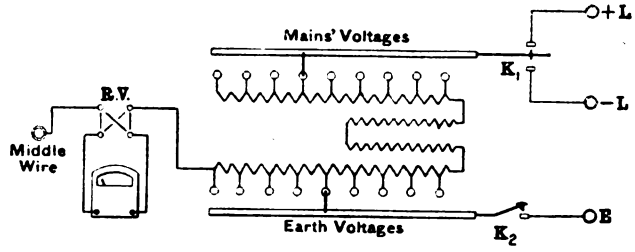

FIG. 5.

voltage over the outer wires should be unaltered during the few minutes required for the test.

On consideration of the formulæ, it will be observed that the values of the fault conductivities of the outer mains depend for their accuracy upon the determination of the small differences between the large voltages E_1' and E_1. To render this measurement sensitive two methods are suggested : (*a*) in which a voltmeter having an initial spring tension, and, say, of 10,000 ohms resistance, reading from 230 to 270 volts, is used ; (*b*) in which a low-reading voltmeter is connected to a sliding contact (see Fig. 4) on a slide wire connected to the outer mains, the other terminal of the voltmeter being connected to the middle wire.

By varying the series resistance of the voltmeter, one voltmeter may be used to measure sensitively both $E_1' - E_1$ and $e - e'$, in both these methods.

If, in method (*a*), for example, with total resistance of 10,000 ohms a voltmeter reads from 230 to 270 volts, then by altering this to 100 ohms it will read from 2·3 to 2·7 volts. Such an instrument should be provided with a rheostat having two sliders, two rows of contacts, and two keys as in the diagram (Fig. 5), each contact being marked with the volts per division on the voltmeter. The resistances between the contacts should be chosen so as to enable all voltages to be measured between, say, 90 and 120, 190, and 230, 240, and 260 on the upper row ; and between 0·2 and 15 on the lower row. R.V. is a reversing switch. K_1 and K_2 are keys connecting the voltmeter to the outer wires and earth respectively.

The instrument represented in Fig. 5 may also be used to make the test of the combined fault by the methods given above provided that the value of one scale division in amperes is known. We thus have an instrument which enables the

Editorial Department
ELECTRICAL WORLD

Digitized by Google

fault resistances of each of the three live mains of a 3-wire system to be determined.

The second method (*b*) of using a low-reading voltmeter for measuring $E_1' - E_1$ is as follows: A graduated potential slide P Q (Fig. 6) is connected between the outers, and a low-reading voltmeter is connected alternately between the sliding contact M and the middle wire, and between earth and the middle wire by means of a plug switch. When the plug is in hole 1, let v be the voltage indicated, and let k_1 and k_2 represent the reciprocals of the resistances P M and Q M, and let k_0 be the reciprocal of the resistance of the voltmeter and its

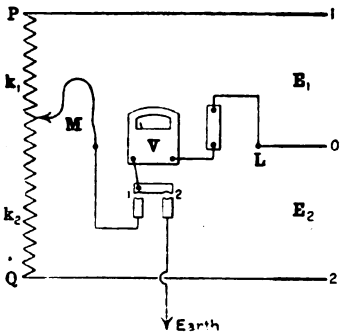

Fig. 6.

series resistance if any is used when connected to M. If, now, E_1 is changed to $E_1 + \Delta E$, and E_2 to $E_2 - \Delta E$, by simply altering the shunt regulator of the balancer, and if the reading v changes by an amount Δv, the formulæ (1) and (2) may now be written:—

$$e_1 = \frac{K}{E_1}\left[E_2 \frac{\Delta e}{\Delta v}\frac{(k_1 + k_2)}{k} - e\right], \quad \ldots \quad \ldots \quad \ldots \quad (3)$$

$$e_2 = \frac{K}{E_2}\left[E_2 \frac{\Delta e}{\Delta v}\frac{(k_1 + k_2)}{k} + e\right] \quad \ldots \quad \ldots \quad \ldots \quad (4)$$

where $k = k_1 + k_2 + k_0$.

The potential slide should be marked with the values of $\frac{k_1 + k_2}{k}$, corresponding to various positions of the contact point M to facilitate calculation, and for a few useful values of k_0 the reciprocal of the voltmeter resistance, which is included in k. In order to enable the change of the voltage between the middle wire and earth to be sensitively measured, a voltmeter with initial spring tension may be used for the measurement of both Δe and Δv, but it must be provided with a variable series resistance.

The authors also describe a further modification by which the measurement of the mains' voltages may be obviated, so that only one indicating instrument is required to make all the measurements for determining the fault resistances of the three mains of a 3-wire system.

IMPROVEMENT OF POWER FACTOR

Birmingham Discussion on Mr. Miles Walker's Paper

AFTER the discussion on Mr. Baldwin's Paper on telephone cables at the meeting of the Birmingham section of the Institution of Electrical Engineers, reported on p. 391 of our last issue, a discussion was held on Mr. Miles Walker's Paper on the improvement of power factor in central stations. In this Paper, which was read before the Manchester section in January (see Electrical Engineering, January 21st, page 65) the author pointed out that the chief cause of low power factor was the induction motor. After explaining the method devised by Leblanc for supplying the magnetising current to the rotor by means of an auxiliary exciter, he stated that the principle could be turned to practical use, were the cost of the additional machines not excessive, and he described a specially designed machine which could be used for this purpose. By the aid of this machine, he suggested that not only would the power factor of any induction motor be raised to unity, but a certain amount of speed variation could be obtained without serious reduction in efficiency.

The discussion was opened by Dr. W. E. Sumpner (Birmingham Municipal School of Technology), who divided the methods of improving the power factor into two main classes, namely, condensers, which were not a success in practice, and machines of some description. In order to effect a general improvement in power factor over the whole system, it was not sufficient to confine one's attention to the generating station. The phase advancer or compensator must be placed close to the load, and in this respect Mr. Miles Walker's device was useful. The whole matter resolved itself into a question of cost, and he was anxious to know what was the cost of the compensator compared with that of the motor. It should be borne in mind that the volt-amperes to be introduced for magnetisation purposes depended on the frequency at which they were introduced.

Mr. A. M. Taylor (Birmingham Corporation Electricity Department) asked whether the author's exciter or phase advancer could only be used in close proximity to the motor. If this were so, it would be a disadvantage in the case of mines owing to the sparking difficulty. He wished to know what was the size of the commutator. He further remarked that it would be of no use in transmission lines, as it would not improve the reactance drop in the line.

Dr. J. D. Coales (Birmingham University) suggested that the use of an open coil armature in the exciter would cause sparking as in the old arc lighting machines. He asked whether the poles were salient, which was not the case in the Heyland motor.

Prof. Gisbert Kapp (Birmingham University) pointed out that if the inductive drop was taken between no load and full load, the drop for 80 per cent. power factor would be only 15½ per cent., not 18 per cent., as stated by the author at the beginning of the Paper. He questioned the author's definition of the energy of a magnetic field as consisting of two factors, the total flux and the magneto-motive force. In induction motors of large size, say 1,000 h.p., the power factor was as high as 0·96, so that there was not much need for phase-advancers in this connection. If a consumer, when installing a number of motors, would arrange to put in one synchronous motor, this could, by over-excitation, be arranged to do all that Mr. Walker proposed. If the exciter could be used with single-phase motors it would be of great value, as the power factor was very low in this class of motor, but he doubted if this were possible.

Mr. Miles Walker, in reply, said that it was too early to ask about the price, but to give some idea of the size of machine necessary, he would state that the ratio of the size of the exciter to that of the motor was practically the same as the ratio of the slip to the full speed. For instance, with a 1,000 h.p. motor, in which the slip would probably be about 2 per cent., the K.V.A. of the phase advancer would be 20. He considered the minimum size for which his exciter should be used was 100 h.p. He stated that where a number of motors were being installed it would be feasible to provide one large motor with phase-advancer, and thus enable it to bring the power factor of the whole load up to unity. The necessity for some such device first became apparent in connection with the requirements of a large power company in the North of England, where some rolling mill motors were being installed, and where synchronous motors were not possible. With regard to the commutator, the sparking was not at all serious. For a motor of 800 h.p., the commutator was 9 in. diameter, and about the same length; it was nearly covered with brushes. Owing to the low voltage, the open coil type of armature did not present any difficulties. The open circuit winding was used in order to put many coils in parallel and so furnish a heavy current. With regard to the reactance drop in the transmission line, referred to by Mr. Taylor, the improvement in the power factor of the motor at the further end of the line would reduce the reactance drop in the transmission line. His exciter was constructed with salient poles. Prof. Kapp was correct in pointing out that the inductive drop at 0·8 power factor would be 15½ per cent., not 18 per cent., as stated in the Paper. His definition of the energy of a magnetic field as consisting of two factors was, in his opinion, the right one. The energy was equal to the total lines through a section at right angles to the direction of the field multiplied by the magneto-motive force (or distance between poles) multiplied by constant. He had not been able to devote any attention to the application of his exciter to a single-phase motor, but he did not see any reason to doubt that it could be made to work.

"Unlicensed" Tramcar Conductors.—Two summonses were taken out against the London United Tramways, Ltd., last week for allowing unlicensed conductors to work upon their cars during the recent strike. As a matter of fact, in practically all tramway Acts powers are given to employ an unlicensed person as driver or conductor for a period not exceeding 24 hours in cases of unavoidable necessity. The company, in defending the summonses, claimed that the strike came within that definition, and the magistrates holding that view, the summonses were dismissed.

ELECTRIC WELDING

A PAPER was read on April 17th, by Mr. V. D. Green (of Messrs. S. Jevons & Co., Midland Agents of the Electric Welding Co.) before the Birmingham and District Electric Club on "Electric Welding." The author treated of the systems in use under the following headings :—Arc welding processes, methods of welding by means of the heat generated by the passage of current through a semi-conducting liquid, on the lines of an electric furnace, and welding by alternating current, which is stepped down by a special transformer to the low pressure required, and the heat generated between the abutting surfaces of the work itself.

The first attempts at electric welding were by the arc method. In the Bernados process, the work itself is made the positive pole of the arc, and the negative is a stick of hard carbon. Continuous current is used from a dynamo, battery or both. Such work as lap welding of boiler plates and ordinary smithy work may be carried out, and a similar process is applicable to the cutting of heavy girders. The principal field is repair work and operations on work in position. The heat given out is in excess of that by the oxy-hydrogen and oxy-acetylene processes, but the heat regulation is not good. There is also a disadvantage that the excess of carbon liable to be deposited renders it unsuitable for most classes of steels. A modification of this system designed to overcome the carbon difficulty is that known as the "Voltex." Here the work is not connected to the circuit, and the arc is formed between two carbons. An electromagnet deflects the arc on to the weld. The heat regulation by this method is much better than in the Bernados process.

Another process which can be used for welding as well as for annealing, brazing, soldering, tempering, &c., is the acidulated water process, patented by Mr. Paul Hohe in 1892, but which for various reasons has not been adopted to any great extent. The apparatus employed consists of a bath or vat large enough to contain the articles to be heated, a pair of tongs with insulated handles for gripping the work, and suitable provision for current supply and regulation. The vat is filled with acidulated water or any liquid having a low resistance, and is made the anode while the tongs holding the work are connected to the negative pole. On completing the circuit by plunging the work into the liquid, a thin film of hydrogen, formed by electrolytic action, surrounds it, and not only by its resistance causes an intense and highly localised heat to be developed, but keeps the surrounding liquid from contact with the metal. When the heat is obtained, the welding has to be carried out in the ordinary way over the anvil.

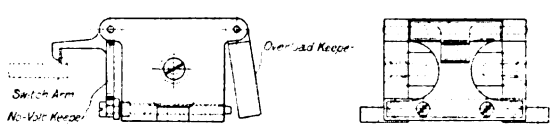
The most satisfactory method of electric welding is probably that introduced originally by Prof. Elihu Thomson in 1885, in which a heavy current is caused to pass through the abutting ends of the metal to be welded, thereby generating heat at the point of contact, which also becomes the point of highest resistance. At the same time mechanical pressure is applied to force the parts together. The heating is very even, and the welds are homogeneous. The excellent regulation obtainable permits of difficult processes, such as the welding of dissimilar metals, to be carried out, and tram-rails, pipes, &c., may be welded together in position. The whole of the tram-lines at Wolverhampton were welded in this way. The principal field of the Thomson process lies in its adaptability to the rapid reproduction of standard work, though jobbing repairs can also be caried out by its aid. For such work a "universal" type of welder is made. In this machine all electrical parts are enclosed within the cast-iron base, with the exception of the two ends of the secondary coil, consisting, as usual, of a single turn of heavy cast copper. These terminate in broad flat surfaces with "V"-shaped grooves in the centre to increase the area of contact. Both these and the under surface of the clamps which slide upon them are carefully scraped true, otherwise the loss of power would be serious. The clamps are provided with hand-wheels for tightening, and the "follow up" motion is actuated by another hand-wheel about 3 ft. in diameter, working on a rack on the movable jaw-holder. Both jaws are water-cooled. A particularly interesting class of repair which may be done with the "Universal" machine is the welding of a broken armature shaft, without the necessity of re-winding the core. Another somewhat similar machine is employed for welding iron and mild steel rings, such as are used in the harness trade. Of the semi-automatic class of welder there are numerous examples. Most wire-welding machines, such as are used in cable factories, are of this description. Rim welders—another class of partly automatic machines—which are largely used for cycle and perambulator rims, have an extra attachment for reducing the burr formed by the weld. A sort of "die" is fixed under the clamps, whose contour exactly corresponds with the normal cross section of the rim, and on the weld being completed a suitable top die attached to a species of tilt hammer, actuated by a belt-driven eccentric, comes down and swages out the burr. A final touch on an emery wheel is sometimes required at the edges, but that is a mere nothing to the difficulty of grinding out an irregular section like a cycle rim.

Pipe-welders are not unlike wire-welders, except that heavier currents are required and specially powerful holders and hydraulic "follow-up" motion rams are used. Cycle frames, &c., may be made by their means, the brackets being welded into one solid piece with the frame—obviously a far more reliable method than brazing. Yet another interesting example may be noticed before turning to the class of entirely automatic welders. This particular type is intended for carriage hardware, and the special difficulty is that two pieces of different cross section require to be united at one point. As the cross section affects both the current and voltage required, it would not do to merely couple up one piece to one clamp and one to the other. Therefore two transformers are arranged side by side under the table of the welder, one being connected to the top and bottom of the larger portion, and the other in a similar manner to the smaller one. Both transformers may be regulated independently, and are worked thus :—No. 1 is switched in first, and rapidly heats up the larger section to the required temperature, No. 2 is then put into action to heat the smaller one, and thus the difficulty is satisfactorily overcome. In the United States large quantities of the steel conduit used in installation work are welded along the seam by the Thomson process. In this apparatus the two adjustable ends of the secondary are not provided with jaws, but with rollers. The strip of steel or "skelp" to be dealt with, having first been bent under suitable rollers in a previous process, is fed into the welder. The sliding ends of the secondary press the edges together, and the two rollers, one on either side of the joint, complete the circuit through it. The finished tube may then be drawn down is desired. The result is a pipe in which the walls are of even thickness, and the diameter uniform. A similar machine for large work has also been constructed, and by its use shells up to 16 in. diameter have been made.

In the completely automatic type of welders such as those used for wire fence making or chain welding, the machines once started carry out the complete cycle of operations automatically, and the attendant has only to keep them supplied with wire or rod. Chain-welders are extensively used in America, but for some reason they have not found favour in the eyes of British manufacturers. The wire-fence-weaving machine, of which there are fifteen in existence, is a good example of an automatic welder. In general appearance it resembles, as might be expected, a weaving loom. Galvanised iron wires are led from reels parallel with each other, and adjustable to any distance of mesh within the capacity of the machine. These wires correspond to the "warp" in weaving. Transversely to these, and at intervals corresponding to the mesh selected, are fed wires cut from a reel, which transverse wires are the vertical wires in the finished fence, and correspond to the "weft." A number of small welding transformers are provided—one for each welding point. On the wires being fed into position, they are fused together at the crossings. The current is then cut off, and the cycle of operations is repeated.

Another machine whose action is somewhat different from any of the preceding ones, is known as the "Spot Welder," and it is used principally for uniting large thin plates by a lap weld instead of riveting. There are no jaws, but instead the ends of the secondary terminate in flat copper studs. The upper stud is moved up and down by an eccentric, and the two edges to be united are fed between it and the fixed contact below. At each down stroke a weld is made, and all sorts of sheet metal work can be built up by its aid. In a modification of this machine, known as the "Point Welder," the contact, instead of being round, is oblong, and is usually three to five times the "pitch" of the spot welds it is desired to make. The metal first passes under a die, which raises a succession of "bumps" at its edge, corresponding to the "pitch," and thence passing under the welding contact, three or four welds are made at once—one at each point. The "raising" operation is usually carried out on a separate machine, the two sheets being then fitted together for welding.

The Paper then gave a few figures as to the power required for welding various sections. Round iron and steel bars ¼ in. diameter require about 2 h.p. per ten seconds, while ⅜ in. rods



Digitized by Google

require about 13·3 h.p. per 30 seconds. For heavy iron piping rather more energy is required on account of the greater radiating surface in proportion to the mass: thus 1-in. pipe can be welded with 16·4 h.p. per 47 seconds, 2-in. pipe with 42 h.p. per 84 seconds, and 3-in. pipe requires sa much as 96·2 h.p. per 106 seconds. Generally speaking, iron and steel require less energy than copper, brass coming between them. The time required for the former is, however, greater than for the latter. The speed at which it is possible to work depends very much on the class of welder and the skill of the operator. A hand-controlled machine may only be capable of doing 30 welds per hour, whereas a completely automatic one will turn out as many as 600 welds in the same time.

A COMBINED NO-VOLT AND OVERLOAD RELEASE

THE accompanying figures illustrate a combined no-volt and overload release coil, for use on motor starters, circuit breakers, &c., which has been patented by Mr. C. W. Denny, of 67 Cross Brook Street, Waltham Cross. The single series magnet is fitted with two armatures, or keepers, the one on the left being the no-volt keeper and the other the overload keeper. The coil is mounted in an inclined position, and the no-volt keeper rests on the magnet face, while the overload keeper rests against an adjustable stop away from the magnet face. Passing through a transverse hole in each magnet pole piece is a freely sliding rod or plunger, slightly longer than the pole piece and normally projecting a short distance beyond the overload keeper end of the magnet. The lower ends come opposite to the free end of the overload keeper and the upper ends opposite to the no-volt keeper.

The action of the magnet is as follows:—As soon as the switch arm is brought on to the starter contacts, the main current passes round the coil and energises the magnet. When

Arrangement of Combined No-voltage and Overload Release.

[Scale: ½ Full Size.]

the switch arm has arrived at the full "on" position, it slips under the catch which, owing to the no-volt keeper being attracted and held by the energised magnet, engages with the arm and retains it in its "on" position. Should the current fail or fall below a predetermined value, the magnet will be de-energised, and the spring attached to the switch arm will return it to its "off" position. Should an overload occur, the overload keeper will be attracted towards the magnet face and will strike the projecting lower ends of the loose plungers, which will be forced upwards. This will cause the upper ends to strike the no-volt keeper (which is against the magnet face), and release the switch arm. By arranging the catch arm attached to the no-volt keeper so that the latter has to be only lightly attracted in order to balance a strong pull on the switch lever, it is easily released by the overload keeper coming into action. The no-volt keeper is very much smaller in section than the overload keeper, so that it cannot carry much of the magnetic flux, and allows a large magnetic leakage in the direction of the heavier overload keeper. When the leakage is slightly increased by an excess of current, the overload keeper is attracted and the magnetic circuit completed. Should the overload keeper be only attracted very slowly and with insufficient force to cause the plungers or pins to release the no-volt keeper, the latter will be released by reason of the fact that when the overload keeper comes in close proximity to the face of the magnet, the magnetic reluctance across the intervening air gap is very much decreased, and a greater portion of the magnetic field passes through the overload keeper, consequently weakening the pull on the no-volt keeper, which is then tripped or released by the pull of the switch arm on the catch.

As no shunt coil is required, it is claimed that it is unnecessary to bring up a shunt connection from the motor to the starter; but in general, of course, it will be found necessary to connect the shunt winding of the motor to the other side of the starting resistance in order to start up with the full voltage across the shunts. By combining the two coils into one, however, the connections are simplified, and the cost of the starter reduced.

North-East Coast Institution of Engineers and Shipbuilders.—On May 1st the address of the Institution was altered to Bolbec Hall, Westgate Road, Newcastle-upon-Tyne.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

PRIMARY BATTERIES.—We have received a catalogue of primary cells for telegraphy, telephones, ignition, lighting, and bells from the Atlas Carbon & Battery Co., Ltd. Attention is drawn to the fact that only hard drawn zincs are used in the Leclanché cells instead of cast or rolled zincs. The cells dealt with include the Dania dry cell, which is claimed to be specially suitable for ignition purposes, and a special coil with low current consumption is listed. Other forms of cell include a self-contained cell requiring only to be filled up with water for use, central zinc cells, agglomerate and other Leclanché cells, Daniel, bichromate and Bunsen cells, and special cells for testing and shot firing.

WATER-TIGHT FITTINGS.—We have received from the Cable Accessories Co., Ltd., of Britannia Street Works, Tividale, Tipton, an illustrated list of cast-iron water-tight electric light fittings for use in collieries, factories, ships, &c. These include single and cluster light fittings, bulkhead lamps, and hand lamps.

OVERHEAD EQUIPMENT AND RAILWAY ACCESSORIES.—Messrs. Siemens Bros. Dynamo Works, Ltd., of Caxton House, Westminster, have just issued a new price list of line materials for electric railways. Among the items listed are rosettes, hangers of various patterns, ears, strain insulators, section insulators, crossings, section switches, lightning arresters, guard-wire supports, and trolley wire. The overhead equipment is classified under two headings, namely, the bow-collector and the trolley systems respectively. An illustration of each item is given, and besides general particulars and price, the weight of each is included. We have also received from the same firm a leaflet supplement to another railway list, dealing with automatic and hand-operated switches with magnetic blow-out, for pressures up to 650 volts, and currents up to 300 amperes.

X-RAY APPARATUS.—We have received from Messrs. Siemens Bros. & Co., Ltd., Caxton House, Westminster, a copy of a supplement to their electro-medical catalogue, dealing with switchboards and auxiliary apparatus, including one or more valve-tubes, for adding to ordinary X-ray outfits in order to make them suitable for rapid and instantaneous radiography. The apparatus is designed so that the doctor can use his apparatus in the usual way for therapy or for fluorescent screen work. Immediately he has decided on the portion of the body which he wishes to radiograph, he sets a time relay, closes a switch, and makes the exposure. The switchboards are made with automatic as well as hand control.

MEASURING INSTRUMENTS.—Messrs. Siemens Brothers & Co., Ltd., Caxton House, Westminster, S.W., a copy of the new edition of their catalogue of switchboard instruments, which covers a large range of instruments of all kinds, both indicating and recording, measuring transformers, and accessories, such as brackets and pillars. Electromagnetic instruments are represented by some twelve patterns each of ammeters and voltmeters, and the iron core is treated by a special process by which hysteresis is reduced to a minimum. The instruments are practically dead beat and the insulation resistance is tested with 1,000 volts, and for bracket and pedestal instruments with 2,000 volts. Of the moving-coil type there are about twenty-two patterns each of ammeters and voltmeters. The shunts are made up in sections of tubular form, and are designed to stand vertically, so that a continuous current of air passes through them when in use. The Ferraris induction type instruments are represented by some sixteen patterns each of ammeters, voltmeters, and wattmeters. These instruments are constructed on the rotary field principle, the field being formed by two currents displaced in phase, which causes the rotation of an aluminium drum. The scale, which is 120 degrees, is divided almost evenly. They include wattmeters for three phases unequally loaded, with or without neutral wire, as well as a universal instrument which has three separate movements in one case, and indicates volt, amperes, and kilowatts. Amongst other devices listed is a central station telegraph for transmitting orders between switchboard gallery, engine-room, and boiler-house, and a large assortment of leakage current meters and relays, and various indicators for earth, current direction, and rotary field direction. Particulars are given of a considerable variety of current and pressure transformers for use with switchboard instruments, these being designed in many sizes and patterns, for standing or for mounting on saddles or brackets. Special pressure transformers are supplied for three-phase circuits, consisting of two or three separate transformers combined in a common case. These are so arranged that one phase is unable to influence the other, even if the phases are unequally loaded. In the section relating to recording instruments, the most interesting is the spark-recording type, which is designed to record large variations and rapid fluctuations of current. The record is given by a spark, which pierces the chart immediately under the pointer. A large number of scale diagrams and dimension sketches are given, and full-page views of the testing and calibrating rooms at the Woolwich works are included.

CABLES FOR SHIP-LIGHTING.—We have received from Callender's Cable & Construction Co. a handsome framed etching by C. J. Greene, entitled "A Fleet in Being," which depicts a group of some ten warships of the latest types, on board all of which the main electrical distribution has been effected either entirely or in part by means of Callender's cables and special boxes.

JOINT BOX COMPOUNDS.—A pamphlet from Messrs. W. Geipel & Co. gives particulars of their special "Vulca" joint box compounds. These are the results of a long exhaustive study of the essential qualities of joint box compounds and of the properties of the substances used in their composition, resulting in materials which possess the essential qualities of durability, high resistibility, adhesiveness, freedom from a tendency to crack through vibration or otherwise, and which are thoroughly water and acid proof.

SPRAYING MACHINES, PAINTS, &c.—A calendar for May, June, and July from Messrs. Crozier, Stephens & Co., of Newcastle, illustrates by a series of comic cartoons some of the uses of the "Cromil" spraying machine, and other specialities of the firm, including paints, lubricants, &c.

PARLIAMENTARY INTELLIGENCE

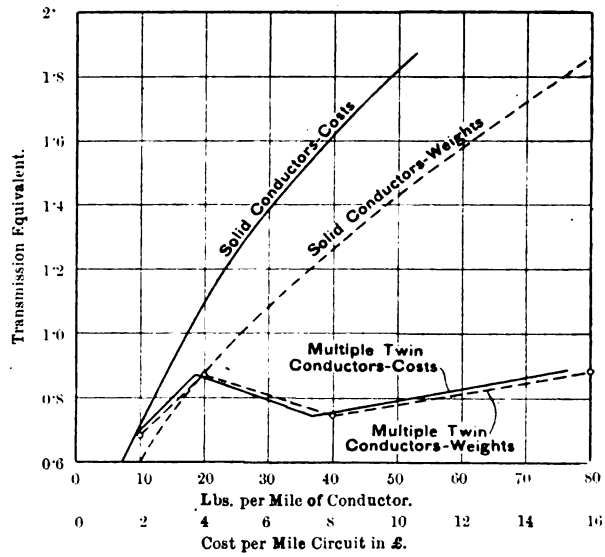
ANGLO-ARGENTINE TRAMWAYS.—This Bill was ordered to be reported for third reading by the Unopposed Committee of the House of Commons on Thursday. It provides for the reorganisation of the company's capital on a more simple basis, it having become very complicated owing to numerous increases and acquisitions of various other tramway undertakings. The present capital consists of £266,600 six per cent. debenture stock; an annuity of £70,660, consideration for purchasing the City of Buenos Ayres Tramways undertaking; a mortgage debt of £565,000 at four per cent.; £1,300,035 six per cent. cumulative first preference shares; £1,600,000 ten per cent. non-cumulative second preference shares; £2,500,000 five per cent. cumulative third preference shares; and £2,500,000 ordinary stock. Under the Bill the six per cent. cumulative first preference shares are converted into 4½ per cent., ranking after the other debenture stocks; and the 10 per cent. non-cumulative preference shares are converted into double the amount of 5 per cent. preference shares.

ELECTRIC SUPPLY BY GAS COMPANIES.—Two Bills promoted by gas companies, in which powers were sought to supply electricity in more or less the same area in the Farnborough district, were dealt with by a Committee of the House of Commons last week. One Bill was promoted by the Yorktown and Blackwater Gas Co., and powers were taken to supply electrical energy in the urban district of Frimley (Surrey), the parishes of Hawley-with-Minley and Yateley, Sandhurst, Crowthorne, Finchampstead, and Wokingham Without. The Aldershot Gas and Water Co., in the other Bill, sought authority to supply electrical energy in Farnborough, Fleet, Cove, Crookham, Minley, Yateley, Frimley, and Ash Normandy. The point to be settled by the Committee was as to whether there should be two companies supplying electricity in the overlapping areas or not. Both sides gave expert evidence to show that their proposal was the best from the engineering point of view, the Aldershot Co. retaining Mr. A. B. Mountain, Electrical Engineer to the Huddersfield Corporation, and the Yorktown Co. Mr. Stephen Sellon. Owing to the extreme scarcity of the probable demand in many parts of the proposed areas, the Committee decided to avoid competition between the two companies, and consequently passed the preambles of both Bills subject to a readjustment of the areas. The Yorktown Co. proposed to raise £50,000 extra capital, and the Aldershot Co. £200,000, but all this is not required for electrical purposes.

LONDON ELECTRIC SUPPLY BILL.—The Parliamentary Committee of the London County Council report having had under consideration the question of the course to be followed by the Council with regard to this Bill, which proposes to constitute the Council the authority to purchase the undertakings of the following companies, viz., the Kensington and Knightsbridge Electric Lighting Co., the Notting Hill Electric Lighting Co., the St. James's and Pall Mall Electric Lighting Co., the Central Electric Supply Co., and the Westminster Electric Supply Corporation. The Committee are advised that two amendments for insertion in the Bill, one of which is intended to make it clear that linking up works provided by the companies under the London (Westminster and Kensington) Electric Supply Companies Act, 1908, shall be purchasable as part of the companies' undertakings, are necessary, and a petition is to be deposited with this end in view.

SCOTCH PROVISIONAL ORDER.—A Commission of Inquiry, appointed by the Board of Trade, considered last week an application for an electric lighting Provisional Order by the Skelmorlie and Wemyss Bay Gas and Electricity Supply Co., Ltd. The company has been in existence for forty years as a gas undertaking.

PROGRESS OF ELECTRICAL BILLS.—The Durham (County) Electric Power Supply Bill was read a second time in the House of Commons on Monday. The West Kent Electric Power Bill was read a second time in the House of Lords on Wednesday last week.



OXFORD AND DISTRICT TRAMWAYS.—This Bill will come before the Unopposed Committee of the House of Commons to-day (Thursday).

GATESHEAD AND DISTRICT TRAMWAYS.—All opposition to this Bill having been withdrawn, it has been referred to the Unopposed Committee of the House of Lords.

ELECTRIC LIGHTING PROVISIONAL ORDERS.—Two electric lighting Provisional Order Confirmation Bills were introduced into the House of Lords on Monday. No. 1 relates to Chesham (Extension), Cleethorpes (Amendment), Herne Bay, Hindhead and District (Extension), Holsworthy, Southampton (Extension), Staines, Stourbridge, Turton, and Walton-on-Naze. No. 2 grants an electric lighting provisional order for Dunfermline and district.

TELEPHONE CABLES

IN our report of the recent discussion on telephone cables at Birmingham (ELECTRICAL ENGINEERING, April 29th, p. 392), we referred briefly to a comparison made by Mr. Dudley Stuart, of the National Telephone Co., between the ordinary cable and the Martin-Dieselhorst multiple twin system of laying up. We are now able to reproduce a curve which illustrates this comparison. It has been claimed for the Martin-Dieselhorst cable that, by combining a number of circuits of equal weight, the transmission equivalents of heavier conductors could be obtained. Mr. Stuart points out, however, that whilst the use of 10 lb. conductors for each leg of a circuit on the Martin-Dieselhorst multiple twin system gives a transmission value nearly equal to that of a 20 lb. solid conductor circuit at practically the same cost, successive combining increases the cost in proportion to the weight of the conductor, but does not give any increase of transmission values. It will be seen also that the two cost and weight curves do not coincide in both instances.

MARTIN-DIESELHORST MULTIPLE TWIN *v.* ORDINARY DRY CORE CABLE. TRANSMISSION VALUES AGAINST COSTS AND WEIGHTS OF CONDUCTORS.

The reason is that in the Martin-Dieselhorst cable the cost of the circuits of difference weights is directly proportional to their weights. This, however, is not the case in ordinary cables, as each circuit consists of a single pair of conductors, the desired weight of copper being obtained by building the cable of 20 lb., 40 lb., &c., wires as required.

The following information, supplied by Mr. Stuart, will also be found interesting. A cable with a sheath 125 mils. thick and 2·625 ins. external diameter can be made to contain 680 pairs of 10 lb. conductors on the Martin-Dieselhorst system, or 750 pairs of the same sized conductors on the ordinary system. The number of pairs in ordinary cables with heavier conductors are as follows for the same size of sheath :—350 pairs of 20-lb. conductors, 185 pairs of 40-lb. conductors, 102 pairs of 70-lb. conductors, or 91 pairs of 80-lb. conductors.

Engineering Trip to Canada.—Arrangements have been made, with the assistance of many large engineering firms, for a trip to Canada this summer, from the end of July to September, lasting about seven weeks. The trip has been organised for engineers and engineering students, and a large number of engineering works will be visited. The total cost of the trip is fifty guineas. Among the places which it is intended to visit are Quebec, Montreal, Ottawa, Peterborough, Toronto, and Niagara. The closing date for the list is Monday, May 24th, 1909. A programme, giving a list of the works to be visited, and any further information, may be obtained from the Universities' Trip Committee, 29 Outer Temple, Strand, London, W.C.

LOCAL NOTES

ACCRINGTON: *Electrical Exhibition.*—An electrical exhibition is to be held in the Town Hall shortly, under the direction of the electricity department, and the Council are recommended to grant £100 towards the expenses.

ASTON: *Electricity Accounts.*—The preliminary draft of the accounts of the electricity undertaking for the year to March 31st, 1909, shows a gross profit of £11,292 against £9,730 for the previous twelve months. After meeting capital charges, there is a net balance of £3,156 against £3,085 last year.

BIRMINGHAM: *Gas Committee v. Electricity Committee.*—As the result of a conference convened by the Lord Mayor, the Gas Committee have arranged with the Electric Supply Committee, that a small standing committee of reference, consisting of the Lord Mayor and three members of each committee, shall be constituted to deal with any differences that may possibly arise from time to time in the conduct of the two undertakings. Subject to exceptions specially authorised by the Council, neither committee is to make any charge which is not in accordance with the rates already approved by the Council, and in special cases the proposals are to be submitted to the Standing Committee before the bargain is concluded.

BLACKBURN: *Electricity and Tramway Undertakings.*—There was a profit last year of about £1,000 upon the electricity undertaking, but there is a loss on the tramways of about £4,800. This is accounted for by heavy expenditure on permanent way, and a decrease in the receipts of 1d. per car mile, attributed to bad trade and wet weather. The Town Council are to be asked to vote £4,000 out of the rates to wipe out this deficit, and the remaining £800, it is thought, can be met out of a small reserve fund.

BRIGHTON: *Tramway Loss.*—It is estimated that there will be a loss of about £1,600 upon the working of the municipal tramways for the year ended March 31st, which is about twice the deficit for the year 1907-8. Although the traffic receipts have increased, the loss is due to the heavy expenditure on renewals which has been necessary.

CARDIFF: *Tramway Fares.*—Mr. Arthur Ellis, the Tramways Manager, has prepared a report, in which he deals with certain anomalies in regard to the fares charged on the tramways. He first of all points out that it was becoming generally recognised that many of the fares on the Council's tramways were too low; in some cases a passenger could be carried 2½ miles for one penny. On the other hand, there were considerable differences between the fares charged on different routes, although the distances were approximately the same. The fault is placed upon the Council for overhauling and revising the fares when the trams were taken over from the company. The report, which was adopted by the Council at its last meeting, recommends certain additions to the fares charged on a number of routes.

DOVER: *I.M.E.A. Meeting.*—It has been decided to pay the expenses of the Electrical Engineer to the annual meeting of the Incorporated Municipal Electrical Association at Manchester in June.

HEBDEN BRIDGE: *Electricity Committee.*—Councillor R. Sutcliffe has been elected Chairman of the Electricity Committee.

KIRKCALDY: *Tramway Extension.*—Some private promoters have placed before the Corporation a proposal to construct tramways from Inverkeithing to Kirkcaldy and Dunfermline. The question of running powers, &c., over the Kirkcaldy lines is being considered.

LEICESTER: *Charges for Power Supply.*—Hitherto the charge for electrical energy used for power purposes has been a flat rate of 2d. per unit, but the Gas and Electric Lighting Committee recommend that an alternative rate of 15s. per quarter per h.p. plus ¾d. per unit be offered.

LIVERPOOL: *Tramways.*—For the sixteen weeks from January 1st 36,740,654 passengers have been carried upon the Corporation tramways, a decrease of 185,647 compared with the corresponding period of last year, the receipts amounting to £169,116, against £169,660. The car mileage was less by 143,330 miles.

LONDON: *County Council's Outstanding Debt.*—The Finance Committee of the Council have prepared a return dealing with the debt of London. This, however, only takes in the period to March 31st, 1908. On that date the total debt of London secured on the rates was £109,931,239, an increase of £1,372,862 during the year. The debt attributable to revenue producing undertakings is nearly 50 per cent. of the total, and includes the following:—Tramways (London County Council), £7,262,140; electric lighting (metropolitan borough councils), £5,408,701.

Metropolitan Electric Tramways.—The Highways Committee recommend the Council to agree to a request by the Metropolitan Electric Tramways, Ltd., to be allowed to carry parcels upon the line of tramway in the Archway Road, Highgate, which is run under lease from the Council. The company has similar power on all its own lines.

City of London: Blackfriars Bridge.—It is announced that the structural alterations to Blackfriars Bridge in order to admit of the passage of tramways, which will link up the London County Council's southern systems, will be completed by November.

Hammersmith: Electric Lighting Loan.—The Finance Committee of the London County Council report the completion of a loan of £9,468 for electric lighting purposes.

Poplar: Electric Lighting Loan.—The Finance Committee of the London County Council report the completion of a loan of £10,000 for electric lighting purposes.

Stepney: Overhead Tramways.—The Works Committee recommend the Borough Council not to give its consent to the adoption by the London County Council of the overhead system upon any portion of the Mile End Road tramways; but to insist upon the conduit system throughout the whole route from Aldgate to Bow.

MANCHESTER: *Tramways.*—Owing to a special appeal by the Lord Mayor and the Chairman of the Finance Committee, the Tramways Committee have consented to contribute the sum of £75,000 towards relief of rates out of the profits for last year. At the commencement of the year the Tramways Committee estimated on handing over £60,000. With the sum of £75,000 mentioned above, the tramways undertaking will have contributed £451,000 to the rates out of profits since the undertaking was first started.

MORECAMBE: *Electricity Undertaking.*—A deficiency of £2,083 is shown by the accounts of the electricity undertaking for the year to March 31st.

NELSON: *Electricity and Tramway Accounts.*—The accounts of the electricity department for the year to March 31st show a decrease from lighting, which is attributed to the more general use of metal filament lamps, and partially to depression in trade. The net profit was only £36, against an estimated profit of £139. The number of units sold during the year was 889,573. The result of the year's working of the tramways has been a loss of £819, against an estimated loss of £118.

NORTHAMPTON: *Trackless Trolley System.*—A deputation from the Tramways Committee, including the Manager and the Borough Engineer, is to visit the Continent to inspect places where the trackless trolley system is in use.

PRESTON: *Tramway Accounts.*—The accounts of the municipal tramway undertaking for the twelve months ended March 31st show that the number of passengers carried was 8½ millions, a figure slightly in excess of last year. The car mileage shows an increase of 18,000 miles. The total receipts were £38,863, as against £38,762, and the earnings per car mile 9·94d., a slight reduction. The traffic expenses were £23,495, an increase of £534 upon last year, and the balance of gross profit was £15,368. After deducting capital charges, there is a net profit of £3,762, or £568 more than last year. The reserve fund at present stands at £16,865, and the sum of £23,000 has been repaid off loans.

SHEFFIELD: *The Trackless Trolley System.*—The deputation from the Corporation which recently visited the Continent to inspect installations upon the trackless trolley system, has now presented its report. It is recommended that the system should be tried in the suburbs of Sheffield. The particular system favoured by the Committee is the Mercedes-Stoll system. This is used as an extension to one of the tramway routes at Potzleinsdorf Salmannsdorf, on the west side of the city of Vienna. This is stated to be the first line that has been connected directly to the network of existing tramways. This system has been in operation since October 18th, 1908, since which date a regular service of cars has been run. The length of the route is about 1½ miles, and over what is at the present time an ordinary macadamised road with a gradient in one place of 1 in 10, which the cars negotiate without trouble. The equipment consists of side poles and trolley lines similar in many respects to the ordinary tramway equipment, the chief difference being that four wires are used instead of two (that is, two wires for the up cars and two wires for the down cars), this duplication of wires having been introduced since experience has been gained with the system, in order to avoid the necessity of cars stopping when they meet each other on the road whilst the connection to the trolley carriage is changed from one car to the other. The deputation recommend that the system should be adopted from the present tramway terminus at Woodseats along the Chesterfield Road to Dronfield. A number of other routes are also suggested, should the above experiment prove successful. It is estimated that the cost of the overhead equipment will be about £3,000 per mile, and the cost of the cars £600 each. The Tramways Committee have adopted the report of the deputation.

SOUTH SHIELDS: *The Tunnel under the Tyne.*—The North-Eastern Railway Co. is to be asked to guarantee half the interest on the £100,000 four per cent. debenture capital of the proposed company for constructing an electric tube railway under the River Tyne, if the local authorities interested will, between them, guarantee the remaining half.

YORK: *Electricity Accounts.*—The accounts of the Electricity Department for the year to March 31st states that the revenue amounted to £18,248. The expenditure amounted to

Digitized by Google

£9,478, leaving a profit balance of £8,770. Interest and sinking fund absorbs £7,789, leaving a net profit for the year of £981. Previous deficiencies on the revenue account amount to £4,927 1s. 3d. Further, there are amounts, making in all £1,861, charged to capital account, which were disallowed by the Local Government Board, and that sum, together with the deficit balance mentioned, comes to £6,788, which is to be provided out of rates within the next two years, less the £981 profit previously mentioned. During the year 1,671,702 B.T units were generated, of which 1,342,815 were sold.

Tramways.—The poll of ratepayers on the question of whether the Corporation should retain the working of the tramways in their own hands has resulted in a majority of 2,485 in favour.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ABERDEEN.—The Corporation propose to borrow £17,000 for the purposes of the electrical undertaking.

CARDIFF.—A Local Government Board inquiry is to be held into an application by the Corporation for sanction to borrow £2,960 for the purpose of electric supply in Whitchurch.

SOUTHAMPTON.—Owing to the present low price of copper, tenders are to be invited by the Town Council for the supply of heavy cable for trunk main purposes, the delivery to be made in June, 1910. The Borough Electrical Engineer is to furnish alternative estimates:—(1) For the supply and erection by Messrs. Babcock & Wilcox of a boiler of 5,252 sq. ft. heating surface, which will be identical in size with the last boiler purchased from the same firm; and (2) for the erection of a new boiler by the staff, using such parts from the existing boiler as are available. Application is to be made to the Local Government Board for sanction to borrow £3,000 for mains and services.

WATFORD.—A Local Government Board inquiry is to be held to-day into an application by the Corporation for sanction to borrow £4,952 for electrical extensions.

WIGAN.—Tenders are invited by the Corporation for the following plant for the electricity works:—(1) 750-kw. engine and generator; (2) two water tube boilers; (3) steam and feed water piping, motor-driven feed pumps, economisers, superheaters, feed water filter and meter; (4) exhaust steam and water piping, motor-driven pumps, and condenser; (5) coal-handling plant and bunkers; (6) high- and low-tension cables; (7) high- and low-tension switchboard; (8) removal of plant from Pemberton generating station to Wigan; (9) constructional steel work for boiler house extension and switchboard gallery. Specifications, &c., from Mr. James Slevin, Borough Electrical Engineer, Bradford Place, Wigan, fee 3 guineas each (returnable), and tenders to the Town Clerk by May 17th.

Miscellaneous

BRISTOL.—Tenders are invited for arc lamp globes. Particulars from H. Faraday Proctor, City Electrical Engineer, and tenders by May 28th.

CANADA.—It is announced that about 1,600 miles of new telephone lines are to be erected in Manitoba and Alberta.

CHELMSFORD.—A recommendation by the Lighting Committee to light certain streets by gas has been defeated in favour of the adoption of electric lighting.

FINCHLEY.—A Local Government Board inquiry was held on Tuesday into an application by the Corporation for sanction to borrow £2,200 for a public lighting scheme.

GRAVESEND.—A scheme of public lighting, by which the present Nernst lamps will be superseded, has been referred back to the Electricity Committee for further consideration. The present cost of lighting the old main road is £890 per annum, plus repairs, but the Electrical Engineer has prepared a scheme for lighting this and another street at £720 per annum, but with an initial outlay of £590.

ITALY.—The acting British Consul at Rome reports, says the *Board of Trade Journal*, that the recent call of tenders for the supply of electric lamps to the Italian Royal arsenals (ELECTRICAL ENGINEERING, April 1st, p. 316), has been withdrawn.

LEYTON.—The Electrical Co. having refused to accept the conditions specified as to the cost of carbons for the Blondel arc lamps they offered for trial, the Electrical Engineer is to draw up a specification of the requirements for proposed new flame arc lamps, and send it to the several arc lamp makers asking them to tender and submit a sample series on approval. Tenders are to be invited for the supply of coal to the generating station. Mechanical stokers are to be fitted to two of the boilers.

LONDON: *London County Council.*—An expenditure of £825 is recommended in the purchase of 12 feeder pillars for tramway termini.

The Highways Committee recommend an expenditure of £81,570 upon the construction, on the underground conduit system, of tramways from Brockley Road to Forest Hill. The lines will comprise about 2½ miles of double track.

St. Pancras.—Tenders are invited for arc lamp carbons. Particulars from the Town Clerk.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—Additions to Red House School, Love Lane, Bromley-by-Bow. Architects, Holman & Goodham, 6 King's Bench Walk, Temple, E.C.

E.C.—Additions to Nos. 2A Moorgate Street and 13 King's Arms Yards for the British Bank of South Africa. H. C. Clarke, 6 Kensington Gardens Square, S.W.

N.—County school (£11,037), Wood Green. Builder, Mattock Bros., Wood Green, N.

N.W.—Rebuilding Trinity Presbyterian Church, Buck Street, St. Pancras. Architect, G. Lethbridge, 7 Drapers Gardens, Throgmorton Avenue, E.C.

S.E.—The second portion of the Greenwich power station of the London County Council is to be wired for electric lighting at an estimated cost of £160.

S.W.—Re-erection of Nos. 394, 396, 398, and 400 King's Road, Chelsea. Architects, Elms & Jupp, 25 Sackville Street, W.C.

Telephone exchange, Streatham High Road, Streatham. Architects, Bromley & Watkins, 6 South Square, Gray's Inn, W.C.

PROVINCES.

BANGOR.—College buildings (£32,000). Architect, H. Hare, 13 Hart Street, W.C. Builder, H. Willcox, Wolverhampton.

BEDFORD.—All Saints' Church. Architects, Blowfield & Son, 6 Montague Place, W.

BIRMINGHAM.—Handicrafts centre, Birchfield Road. Architect, J. P. Osborne, 95 Colmore Row, Birmingham.

BISHOP AUCKLAND.—Hippodrome. Architect, E. Taylor, Northgate, Darlington.

BEDMINSTER.—Theatre. Architect, W. Skinner, Edinburgh Chambers, Bristol.

LIVERPOOL.—Residence (£3,000). Architects, Woolfall & Eccles, 60 Castle Street, Liverpool.

MANCHESTER.—Roman Catholic Home. Architect, A. C. Hill, 9 Albert Square, Manchester.

OXFORD.—New buildings, Newnham College (£10,000). Architect, B. Champneys, 19 Buckingham Street, W.C.

SWANSEA.—New exchange buildings. Architect, O'Schenck, Dicks' Exchange Offices, Swansea.

WOLVERHAMPTON.—New baths (£9,269). G. Green, Borough Engineer, Town Hall, Wolverhampton.

TENDERS RECEIVED AND ACCEPTED

ASHTON-UNDER-LYNE.—The tender of the Standard Engineering Co. has been accepted for an induced-draught fan, and that of the Stirling Boiler Co. for a water-tube boiler with superheater and chain-grate stoker.

BRIGHOUSE.—Tenders from the following firms have been accepted in connection with the sub-station for taking a supply of electricity in bulk from the Yorkshire Electric Power Co.:—Phœnix Dynamo Co., W. T. Glover & Co., Edison & Swan Co., and H. Morris & Bastert.

CANADA.—The Temiskaming and Northern Ontario Commission has accepted the tender of the Dominion Wire Manufacturing Co., of Montreal, for 75,000 lbs. hard drawn copper wire, No. 10 gauge, to be used in the building of new telegraph lines.

DARTFORD.—Messrs. Johnson & Phillips, Ltd., have received an order for 800 yards of triple concentric feeder cable at £350.

EASTBOURNE.—The Council has accepted the tender of Ferranti, Ltd., for 100 meters.

ESHER.—The following tenders have been received for the wiring of the buildings at the sewage disposal works:—Donnison, Sillem & Co., £175; W. G. Gifkins & Co., £175; C. Pullan, £170; S. J. Shuter & Wood, £169; Worren, Smith & Co., £169; R. Langston-Jones & Co., £162; Nursey & Marr, £158; H. How & Co., £157; T. Hiscock, £139; Harper Electric Co., £136.

GLOUCESTER.—The tender of Messrs. Crompton & Co. for the supply of Conradty carbons during the ensuing twelve months has been accepted by the Corporation at £105 2s. 7d., less 2½ per cent. discount.

Digitized by Google

GRIMSBY.—The tender of Messrs. Crompton & Co. has been accepted by the Corporation for arc lamp carbons, and that of Messrs. T. Rowatt & Sons, of Edinburgh, for arc lamp globes.

KINGSTON-ON-THAMES.—The Council have accepted the tender of W. T. Glover & Co., Ltd., for 110 yards of 0·035 sq. in. high-tension cable at £17, and of Siemens Bros. & Co., Ltd., for a quarter of a mile of 0·1 sq. in. cable at £95 5s.

LONDON: *London County Council.*—The following tenders have been received for the erection of a painting shop at the Hammersmith car-shed:—A. Roberts & Co., Ltd. (accepted), £4,990; Leslie & Co., Ltd., £4,991; Wm. Johnson & Co., Ltd., £5,005; J. & C. Bowyer, £5,080; Chas. Wall, Ltd., £5,273. The estimate of the architect comparable with the above tenders is £5,140.

Bermondsey.—The Council has accepted the following tenders:—Ferranti, Ltd., meters for 240 and 480 volts; General Electric Co., two rate meters, and time switch combined, electric wind, 240 and 480 volts; Davy enclosed arc lamp carbons, Wm. Geipel & Co.

Poplar.—The Council have received the following tenders for hot-well tanks required for the electricity undertaking:—Fraser & Fraser (accepted), £48 5s.; Durham Bros., £50; H. Edie & Co., £62 16s. 6d.; J. Wilson & Co., £62; W. Boby, £64 18s.; J. Wilson & Co., £68.

Metropolitan Asylums Board.—The tender of Messrs. Speedy, Eynon & Co., of Charing Cross, has been accepted for the installation of telephones, &c., at the South-Western Fever Hospital at £435.

MANCHESTER.—The Brush Electrical Engineering Co., Ltd., have received the contract from the Fine Cotton Spinners' Combine for the electrical equipment of the whole of their mills, which number about 100.

The tender for a storage battery, boosters, and exciters at the Dickinson Street generating station of the Corporation has been placed with the Tudor Accumulator Co., Ltd. The Lancashire Dynamo & Motor Co., Ltd., are sub-contractors.

NOTTINGHAM.—The Corporation have placed an order for two 400-kilowatt reciprocating engines with Messrs. Willans & Robinson, Ltd., of Rugby; the engines are to be direct coupled to direct-current dynamos built by Messrs. Siemens Brothers.

SALFORD.—The Council have accepted the following tenders:—Matthews & Yates, maintenance of electric fans at the London Street and Seedley Council schools at 13s. per fan per quarter. For annual supplies of meters, the following tenders were accepted:—Ferranti, Ltd.; Chamberlain & Hookham, Ltd.; General Electric Company, Ltd.; Reason Manufacturing Company, Ltd. For the annual supplies of arc lamp carbons the tender of Serius Werke (Baden) was accepted, and for the annual supplies of bitumen the tender of the British Electrical Trades Supply & Bitumen Co. was accepted.

ST. HELENS.—The Corporation have recently placed an order for low-level jet condensing plant with Messrs. Willans & Robinson, Ltd., of Rugby

COMPANIES' MEETINGS AND REPORTS

NATIONAL ELECTRIC CONSTRUCTION CO.—The annual general meeting was held on Thursday, when the report and accounts given in our last issue were adopted. Mr. L. B. Schlesinger, the chairman of the company, stated that with the continued depression in the electrical industry it was useless to attempt to finance tramway schemes. The results for the year were, in all the circumstances, satisfactory, in spite of the fact that no dividend was recommended. A large sum was carried forward in continuance of the policy of strengthening the company's financial position. Referring to the various undertakings in which the company is interested, he mentioned that since the overhead system had displaced the surface-contact system at Mexborough, there had been a substantial increase in the receipts. Reference was also made to the new agreement with the Oxford Corporation for the installation of a combined conduit and overhead system instead of a surface-contact system; and the fact that a Bill was now before Parliament for installing the overhead system on the Folkestone, Sandgate, and Hythe tramways was also mentioned. These two undertakings, viz., Oxford and Folkestone, are regarded by the directors as two of the best tramway concessions left in this country. The lack of the promotion of new tramway schemes during the past two or three years was attributed to the unfair use of their powers by local authorities. In many districts where tramways would be practicable, not only would the local authorities not take the risks themselves, but they imposed prohibitive terms upon companies, which was a great contrast to the support given to tramway companies abroad. For this reason, the National Electric Construction Co. would not attempt to promote further tramways in this country. Taking the year as a whole, they had done as well as, if not a little better than, their neighbours engaged in this particular class of business. They had some important negotiations in hand, and were hopeful of obtaining one or two contracts shortly, which should result in satisfactory profits for the company.

GREAT NORTHERN TELEGRAPH CO.—The annual general meeting was held in Copenhagen on April 24th. The chairman, Commodore E. Suenson, D.R.N., presided, and stated that during the year there had been no less than 24 interruptions on the company's 11 cables in Europe and 10 on six cables in the Far East, without reckoning five interruptions necessitated in connection with extensive renewals of the cables between Hongkong, Shanghai, and Nagasaki with heavier types. The company have received notice from the Norwegian Government that the concession for the Norwegian-Danish cable, granted in 1868, prolonged in 1880, and expiring at the end of 1910, will not be renewed. The Norwegian Government has offered to purchase the Norwegian-Danish cable jointly with the Danish Government, but the decision of the Danish Government is being awaited before negotiations can be entered upon. The loss of all the Norwegian traffic after 1910 will mean a considerable decrease in the company's receipts, as the traffic is a very large one, and the price to be paid for the cables, as proposed by Norway, would only be the estimated value of the cable itself and not include any compensation for the loss of revenue. The chairman also pointed out that there had been a further decline in traffic receipts during 1908 of some £18,000. "Interest" had decreased by about £640, whilst "sundries" increased by nearly £400, compared with 1907, a total decrease of about £18,240. In these circumstances, and seeing that there was a further decrease of traffic receipts in the first months of this year, the board of directors propose to make the bonus 2 per cent. less than that for the last two years, thus making the dividend and bonus 18 per cent. for the year, of which 5 per cent. has already been paid as interim dividends. In conclusion, the chairman announced that the alterations in the administration of the company at Copenhagen, mentioned in last year's report, had been effected in September last by his resigning the position of managing director, and the appointment of a board of management, consisting of four members, viz.: General managers, K. Suenson (formerly secretary) and P. Michelsen; engineer-in-chief, K. O. A. Gulstad; inspector of telegraphs, Captain H. Rothe, D.R.E. This board of management took charge on October 1st last.

DUDLEY, STOURBRIDGE & DISTRICT ELECTRIC TRACTION CO.—At the annual general meeting on Thursday the report and accounts given in our last issue were adopted. Mr. S. R. Blundstone presided, and stated that the number of passengers carried during the year was less by about 9 per cent. than the figure for 1907. By the withdrawal of children's tickets 462,409 passengers had been lost, but it was now thought that half fares for children could be successfully introduced.

SOUTH STAFFORDSHIRE TRAMWAYS (LESSEE) CO.—The report and accounts given in our last issue were adopted at the annual meeting on Thursday. Mr. W. S. Schuster, in referring to the overdraft, which had increased from £68 to £2,383, complained of the harassing tactics of local authorities. Mr. Cecil Braithwaite said that the company at one time was paying good dividends, and the present position was not due to bad management. It was a typical instance of the results of municipal "bullying."

WOLVERHAMPTON DISTRICT ELECTRIC TRAMWAYS CO.—The report and accounts given in our last issue were adopted at the meeting on Thursday. It was mentioned by the Chairman, Mr. S. R. Blundstone, that the number of passengers carried during the year was 330,000 less than during 1907, which was largely accounted for by the withdrawal of children's fares. Perhaps these latter would be reintroduced in the Bilston district. Another factor in the poorer financial result was a 5 per cent. increase in rates and taxes.

CITY OF SANTOS IMPROVEMENTS CO.—At the annual general meeting on Thursday, it was stated the number of passengers carried on the tramways in 1908 was 7,335,875, a satisfactory increase as compared with 1907, but, owing to the system being in a transition state, due to the conversion to electrical traction from steam on the Sao Vincente line and on the Mathias system of tramways from animal traction, the net receipts have not been as good as usual. Also, in September last there was a general strike, which caused a heavy loss in receipts. Cable advices had just been received announcing the successful inauguration of the electrification of the tramway between the city and the residential suburbs on the seashore and the town of Sao Vincente.

MERTHYR ELECTRIC TRACTION & LIGHTING CO.—At the annual general meeting last week, the report and accounts given in our last issue were adopted. Mr. W. L. Madgen, who presided, said that the expansion of the company's business would shortly necessitate an increase of capital. Negotiations were now being carried on with the Merthyr Council with a view to the extension of mains into a number of other districts.

BRISBANE ELECTRIC TRAMWAYS INVESTMENT CO.—At the annual meeting last week it was stated that the receipts for 1908 amounted to £178,602, as compared with £159,230 in

Digitized by Google

1907, and the total expenditure to £94,154, compared with £88,117. There was thus an increase in net profit of £13,335. After meeting preference share dividend, a dividend of 6 per cent. is declared on the ordinary shares.

CALCUTTA TRAMWAYS CO.—At the annual general meeting last week, the report and accounts given in our issue for April 15th were adopted. Mr. E. C. Morgan, the chairman of the company, who presided, stated that the year 1908 had been one of great difficulty. About four miles of new line in Calcutta had been opened, in addition to a new car-shed, which would shortly be ready for use. There were also about five miles of line in Howrah, in addition to a separate and very complete equipped power station there. Some people had regarded this as a "white elephant," but the returns from Howrah generally were beginning to show signs of improvement. It was too early to prophesy with regard to this matter, but certain facts must not be lost sight of. The need for communication between Howrah and Calcutta was increasing, and even with the existing disabilities the number of people using the trams was increasing, and it was hoped that before long the Howrah undertaking would be able to bear its own burdens. So far as the present year was concerned, the receipts were better than for the corresponding period of last year, and as the general state of trade in India had decidedly improved, they were now in a position to meet further expansion without misgivings. Sir Henry Kimber, M.P., in seconding the motion for the adoption of the report, expressed his greatest confidence in the undertaking; in fact, he had recently increased his holding.

MELBOURNE ELECTRIC SUPPLY CO.—At the annual general meeting on Monday the report and accounts given in our last issue were adopted. At the close of the annual general meeting, meetings of debenture stockholders and preference and ordinary shareholders were held at which resolutions sanctioning the issue of £100.000 5 per cent. first mortgage debenture stock were passed.

STEWARTS & LLOYDS.—At an extraordinary general meeting in Glasgow, on Friday, it was decided to increase the capital of the company by the creation of 850.000 deferred shares of £1 each. In future the existing ordinary shares will be known as preferred ordinary shares.

RAND MINES.—The report for the year 1908 calls attention to the formation of the Rand Mines Power Supply Co., as the result of the serious attention which has been given to the question of adopting electricity for all purposes in connection with the mines of the company and its subsidiary companies. Favourable contracts, the report states, are in course of completion, and it is anticipated that electric power for the new company will be available in October, 1910.

INDO-EUROPEAN TELEGRAPH CO.—At the annual meeting last week, the report and accounts given in our last issue were adopted. Mr. J. H. Tritton, who presided, said that the directors had been successful in obtaining an extension of the company's Persian concession for a further period of twenty years. The year 1908 would, he said, always be a most memorable one in the history of the company as that in which daily direct Wheatstone working between London and Karachi was perfected, thereby doing away with all re-transmissions, between England and India, over a line 5,900 miles in length, to the very great gain of their customers both in speed and in accuracy of transmission.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival quoted on Tuesday night, was £58 12s. 6d. to £58 17s. 6d. (last week, £58 15s. to £59).

AGENCY.—Messrs. Mawdsley's, Ltd., Zone Works, Dursley, inform us that they have appointed Messrs. C. E. Lugard & Co., Field's Buildings, Middlesbrough, as their representatives for the north-east coast for the "Mawdsley" patent improved continuous-current dynamos and motors.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS UP, &c.—The Auto-Claw Co. is to be wound up voluntarily. Mr. S. P. Child, 8 Frederick's Place, Old Jewry, London, is liquidator. A meeting of creditors will be held at the above address at 2.30 p.m. on May 11th.

The public examination of Arnold Roberts, electrical engineer, of Woodlands Cottage, Rawdon, took place at Bradford last week. The gross liabilities amounted to £3,100 and the assets to £902. Debtor, who had been an electrical engineer's assistant, subsequently started business, with a partner, the capital being £300, which was borrowed. The business was said to have failed through work being taken at "totally inadequate" prices.

The Buenos Ayres Grand National & La Capital Tramways Joint Committee, Ltd., is to be wound up voluntarily. Messrs. E. A. Lazarus and Fortescue Thursby have been appointed liquidators.

PATENTS FOR SALE.—Two patents relating to improvements in electric motors are for sale. (See advertisement this week.

DISSOLUTIONS OF PARTNERSHIP.—F. C. Geary & F. S. Rippin, carrying on business as Electrical Engineers at 25 Central Arcade, Wolverhampton, as Gear, Rippin & Co., have dissolved partnership. F. C. Geary continues.

George Morrison and J. W. Roebuck, carrying on business as Electrical Engineers at 4 Birley Street, Blackpool, as Morrison & Roebuck, have dissolved partnership.

Frank Fearnside and Harold Glover, carrying on business as Electrical Engineers and Contractors at Burke's Buildings, John Street, Bradford, as Fearnside & Glover, have dissolved partnership. Frank Fearnside continues.

CONDENSING PLANTS.—Messrs. Willans & Robinson, Ltd., of Rugby, who during the past few years have paid considerable attention to the manufacture of surface-condensing plants, have now extended this department of their business to include condensers of the Jet type, particularly condensers built on the counter-current and barometric column principles. Due to the large number of instances where condensers of the Jet type are required in connection with exhaust steam turbines, special arrangements have been made for the manufacture of this class of condenser.

JANDUS ARC LAMPS.—The Jandus Arc Lamp & Electric Co. inform us that their offices and show rooms will henceforth be at their Holloway works, additional premises having been acquired for this purpose. As already announced, they have terminated their sole agency agreement with Messrs. Drake & Gorham, Ltd., and, in future, will sell direct only from the Hartham Works, Holloway, London, N. Additional workshop space has also been secured to cope with the rapidly increasing demand for the Regenerative Flame Lamp. The Jandus Company are now in a position to cope with the rapidly increasing demand for these lamps. The plant already installed is sufficient for the manufacture of 12,000 lamps per annum. A special factory has also been laid down for the manufacture of the patented carbons used in conjunction with the Jandus Enclosed Flame Lamp.

APPOINTMENTS AND PERSONAL NOTES

Mr. C. T. Astbury has been appointed resident electrical engineer to the Atherton Urban District Council at a salary of £156 per annum.

Mr. W. M. Proctor, of Harrogate, has been appointed canvasser to the Harrogate municipal electric lighting department for a period of three months at a salary of £2 per week and a commission of 6d. per point.

Mr. Chas. Garnett, Borough Electrical Engineer of Darwen, was married on April 27th to Miss Isabel Aspden. Among the presents was a solid silver salver from the employees of the electricity works.

Mr. R. B. W. Pirie, of the Clyde Valley Electric Power Co., who has been appointed chief internal auditor to the British Columbia Electric Railway Co., Ltd., was entertained at dinner by the Aberdeen Corporation electricity staff last week, prior to his departure for Vancouver. Mr. Pirie was with the Aberdeen Corporation for a number of years.

Agents are required by a leading firm of three-phase and direct-current machinery. (See an advertisement this week.)

The Electricity Committee of the Aston Corporation recommend that the salary of Mr. R. Foster, their Electrical Engineer, should be increased from £400 to £500, as from April 1st, 1909.

An Assistant Engineer is required by the Liverpool Corporation, at a salary of £250 per annum, to take charge of overhead electric tramway equipment. (See an advertisement this week.)

Mr. H. E. Midgley, Deputy Engineer at the Erith Corporation electricity works, was presented with a brass kerb suite by the electricity staff on the occasion of his marriage last week.

Telegraph Traffic and Movements of Cable Ships.—On the 28th ultimo the line between Rome and Constantinople was restored to working order, and on the following day repairs were effected between Bagdad and Bassorah. On the 1st inst. the line between Rome and Constantinople was once more interrupted, but was repaired on the 2nd inst. The line between Bagdad and Bassorah was again *hors de combat* on the 3rd inst.—Telegrams to British Borneo are still accepted subject to senders' risk, and the same conditions still exist in connection with telegrams to the Republic of Colombia, with the exception of those to Buenaventura, Santa Marta, and Cartagena, which are subject to delay.—Ecuador is also a sufferer in this respect, but telegrams may be sent to Guayaquil and St. Helena without restriction of any kind.—The Central and South American Telegraph Company has laid cables across the isthmus of Panama. The cable steamer, "Relay," took 47 miles of "Kerite" cable on board at New York, its diameter being 1½ inches, and weight 339 tons. After overcoming many difficulties, the cable was successfully laid, and the tests after laying were quite satisfactory. At present the cable is laid over the old railway route, but when the canal is finished it will be entirely submerged.

MISCELLANEOUS CITY NOTES

CALCUTTA ELECTRIC SUPPLY CO.—A final dividend for the second half of 1908 is recommended on the ordinary shares at the rate of 9 per cent. per annum, making 8 per cent. for the year.

CITY OF OSAKA (JAPAN).—Subscriptions have been invited this week for £3,084,980 City of Osaka 5 per cent. sterling bonds (£1,250,000 already applied for) at £97 per cent. These are secured by a general charge on the revenues of the city, which includes the electric tramway undertaking.

MEXICO TRAMWAYS & LIGHTING COMPANIES.—The Mexican Government states that there is absolutely no truth in the report of the purchase by the Mexican Government of the Mexico Tramways and the Mexican Light & Power Co.

EASTERN EXTENSION, AUSTRALASIA & CHINA TELEGRAPH CO.—A dividend at the rate of 2s. 6d. per share, together with a bonus of 4s. per share, is recommended on the ordinary shares for the quarter to December 31st, 1908, making a total distribution of 7 per cent. for the year.

CITY OF BUENOS AYRES TRAMWAYS CO.—A dividend of 1s. 3d. per share, less tax, is recommended for the quarter to December 31st.

ST. JAMES'S & PALL MALL ELECTRIC LIGHT CO.—The number of units sold during the quarter ended Lady Day is returned at 2,934,021 units, estimated to produce £38,238, as against 2,879,802 units, which produced £38,709 for the corresponding period of last year.

BRITISH ELECTRIC TRACTION CO.—The Hon. Arthur Stanley, M.P., has been elected to the Board in succession to the late Mr. Arnold-Forster.

NEW COMPANIES

POLKEY AUTOMOBILE ELECTRIC LIGHTING SYNDICATE.—Registered on March 31st, with a capital of £2,000 in £1 shares, to adopt an agreement with J. Polkey, and to carry on the business indicated by the title. Registered office: 126 Pitsford Street, Birmingham.

MONTEGO BAY ELECTRIC LIGHT & POWER CO.—This company has been formed with a capital of £5,500 to supply the Jamaican town of Montego Bay with electric light, &c.

PUGET SOUND POWER CO.—Registered with a capital of eight million dollars, to take over all the electric light, power, and street railway systems in the north-western part of Washington. The properties which are to be transferred include the Seattle Electric Company, the Seattle Tacoma Power Company, the Puget Sound Electric Railway, the Tacoma Light & Power Company, the Everett Interurban, the Everett & Bellingham Street Railways, and Light and Power corporations, and others.

SIR JOHN JACKSON (SOUTH AMERICA).—Registered on April 7th, with a capital of £100,000 in £100 shares, to carry on the business of contractors for public works and conveniences (including railways, tramways, docks, electric light, telegraphic and telephonic works, &c.) in South America. Private company. Table "A" mainly applies. Sir John Jackson, Ltd., has consented to this registration. Registered by Batten, Proffitt, & Scott, 32 Great George Street, S.W.

HUDSON'S BAY & PACIFIC RAILWAY DEVELOPMENT CO.—Registered on April 7th, with a capital of £150,000 in £1 shares, to construct, equip, and operate railways, tramways, telegraphs, and telephonic systems in Canada and elsewhere, &c. Minimum cash subscription half the shares offered to the public. The number of directors is not to be less than four nor more than twelve; the first are G. Bridgman, C. McFarlane, J. B. Helm, D. Lovell, J. H. Bailey, H. W. Dewar, and H. A. Fisher. Qualification (except first directors), 500 shares. Remuneration, £200 each per annum (chairman, £250). Registered office, 56 Moorgate Street, E.C.

POLESWORTH ELECTRICAL APPLIANCES CO.—Registered on April 14th, with a capital of £5,000 in £1 shares, to take over the business of a brick, tile, and electrical appliance manufacturer carried on by C. W. Shackleton, at Polesworth, Warwick, as the Electrical Appliance Co., together with the lease of the premises where the said business is carried on, and his secret process for making glaze and enamel, and for glazing and enamelling goods. Private company. The number of directors is not to be less than two nor more than seven; the first are C. W. Shackleton and T. F. Aikin. Qualification, one share. Registered office, The Mill, Market Street, Polesworth, Warwick.

ENGLISH PIANO-PLAYER CO.—Registered on April 21st, with a capital of £30,000 in £1 shares, to acquire certain patents for improvements in, and connected with, electric auto-musical instruments belonging to J. D. Carmichael, to develop and turn to account the same, and to carry on the business of manufacturers of, agents for, and dealers in, repairers and tuners of pianofortes, organs, harmoniums, and other musical instruments, &c. Private company. The first directors are Sir George Newnes, Bart., M.P., and J. D. Carmichael. Qualification, 100 shares. Registered office: 114 New Bond Street, W.

SALSBURY LAMPS.—Registered on April 16th, with a capital of £10,000, to acquire the business carried on at 124 Long Acre, W.C., as "Salsbury & Son, Ltd.," to adopt an agreement with H. Salsbury and F. Naylor, and to carry on the business of manufacturers of and dealers in lamps, electricity, gas, oil, and other illuminants, cycles, motor-cars, and other vehicles and accessories, &c. Minimum cash subscription, 10 per cent. of the shares offered to the public. The number of directors is not to be less than two nor more than five; the first are H. Salsbury, H. Wyman, and A. H. F. Fitzherbert. Qualification (except first directors), £100. Registered office: 124 Long Acre, W.C.

AGRICULTURAL ELECTRIC DISCHARGE CO.—Registered on April 19th, with a capital of £3,000 in £1 shares (1,000 preference), to carry on the business of vendors of and dealers in certain appliances and apparatus used in connection with inventions for the production of continuous high potential electrical discharges applicable for the deposition of dust, fume, smoke, fog, and mist for the production of rain, and for other purposes in connection with the application of such invention to agriculture and horticulture, and to adopt an agreement with Sir Oliver J. Lodge, Kt., F.R.S., L. Lodge, F. B. Lodge, A. M. Lodge, G. Newman, J. E. Newman, W. F. Newman, and R. Bomford. The subscribers are:—L. Lodge, Mariemont, Edgbaston, electrical engineer; F. B. Lodge, 14 New St., Birmingham, engineer; A. M. Lodge, 14 New St., Birmingham, engineer; G. Newman, Sutton House, Gloucester, corn merchant; J. E. Newman, Sutton House, Gloucester, electrical engineer; W. F. Newman, Sutton House, Gloucester, traveller; R. Bomford, Bevington Hall, Evesham, farmer. Private company. The number of directors is not to be less than three nor more than eight; the first are Sir Oliver Lodge, L. Lodge, F. B. Lodge, A. M. Lodge, G. Newman, J. E. Newman, W. F. Newman, and R. Bomford. Qualification, 50 shares. Remuneration as fixed by the company. Registered office: 3 Howard St., Gloucester.

WARDLE ENGINEERING CO.—Registered on April 27th, with a capital of £5,000 in £1 shares (2,000 preference), to carry on the business of electrical and mechanical engineers, suppliers of electricity for light, heat, motive power, or otherwise, &c. The subscribers are:—C. Wade, Kirk Ella Hall, near Hull, gentleman; C. H. K. Chamen, 112 Portland Street, Manchester, engineer. Registered office:—112 Portland Street, Manchester.

CHORLEY & DISTRICT TRAMWAYS.—Registered on April 29th, with a capital of £300,000 in 50,000 7 per cent. cumulative preferred shares of £4 each, and 3,000 preferred ordinary, and 7,000 ordinary shares of £10 each, to carry out the construction and equipment of the tramways, tramroads, and other works authorised by the Preston, Chorley, and Horwich Tramways Acts of 1903, 1904, and 1906, to acquire the total authorised debenture (£125,000) and share capital (£500,000) of the Preston, Chorley, & Horwich Tramways Co., incorporated by the first of the said three Acts, and to adopt agreements between H. J. Dixon (for the company), and the P., C., & H. Synd., Ltd. The subscribers are:—R. C. M. Pooley, 65 London Wall, E.C.; C. Looker, Finsbury Pavement House, E.C.; H. J. Dixon, 77 Alexandra Road, S. Hampstead, N.W.; Lord Lyveden, Glenwood, Stevenage; A. L. Hutchinson, 27 Mincing Lane, E.C.; G. W. Martin, Blythwood, Wilton Road, Hanwell, W.; J. Shears, 8 Winchester Street, S. Belgravia, S.W. Minimum cash subscription, 500 preference shares. The number of directors is not to be less than 3 nor more than 7; the first are: Lord Lyvedon, R. C. M. Pooley, and C. Looker (all permanent). Qualification, £500. Remuneration, £200 each per annum (chairman, £250). Registered office: 154 Finsbury Pavement House, E.C.

Freezing of Niagara.—The *Electrical World* (New York) contains further particulars of the troubles at the station of the Ontario Power Co., which was flooded after the liberation of ice which had collected during the exceptional frost when the falls were frozen (see ELECTRICAL ENGINEERING, April 29th, page 404). When the level of the water finally fell, several hundred tons of ice were left on the power house floor, and these had to be shovelled out through the windows. The damage to the machines is stated to amount to some £2,000, and quantities of lubricating oil. The cleaning of the machines occupied about 36 hours' continuous work, and their drying out was continued for some days. During the time when the station had to be shut down, sufficient power was obtained from the systems of the Electrical Development Company and the Canadian Niagara Power Co. to keep in service all the public-service corporations normally taking power from the Ontario Power Co. It is stated that all danger of further interruption is now past.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 29th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

7,886/08. **Limit Switch.** Nalder Bros. & Thompson, Ltd., H. W. Handcock, and A. H. Dykes. This switch, which is intended for use in connection with the "contract demand" system of charging, consists of an electromagnet in the main circuit which attracts a spring armature when the current exceeds the limit. This spring normally closes a contact which short-circuits a resistance, and when attracted, puts this resistance in the main circuit. As the current is immediately reduced, the spring flies back and short-circuits the resistance. This operation is repeated, and a flickering of the lamps is produced. Three claims, one figure.

9,033/08. **Commutation of High-Speed D.C. Machines.** V. A. Fynn. Compensating series windings in the main pole shoes are used in conjunction with commutating coils placed near the armature surface in the interpolar spaces, but without magnetic cores. This avoids the increase of the reactance voltage of the coils undergoing commutation, and the increase in the leakage and cross fluxes; a gently graded commutating zone is secured; and the commutating field is made proportional to the armature current. As the compensating ampere-turns are made equal to the armature ampere-turns, there is no distortion of the main field, and danger of high voltages between adjacent commutator segments is avoided. When applied to A.C. machines, it will be necessary to adjust the phase of the commutating field as well as its magnitude and space direction. Four claims, one figure.

14,328/08. **Conduit Tramway System.** A. H. Angle. The contact rail is in sections, and is pushed up into the slot opening level with the road surface by springs. A wheel or slipper carried by the car enters the slot, and depresses the rail so that contact is made on to live studs underneath. Three claims, nine figures.

17,350/08. **Manufacture of Tungsten Filaments.** Siemens & Halske Akt. Ges. The addition of nickel to tungsten increases its ductility, but lowers its melting point. By adding somewhat less than 8 per cent. of nickel, however, and melting, an alloy is produced which is sufficiently ductile to allow of rolling and drawing into fine wire for lamp filaments. Two claims.

20,969/08. **Series-parallel Control.** J. G. V. Lang. This is a method of changing the connections of series traction motors from series to parallel without breaking the circuit. One method is to leave one motor in circuit and short-circuit the other while making the parallel connection. This causes a very heavy current to flow through the short-circuited motor, as its field is not instantly destroyed, and the consequent retardation and the arcing on breaking the circuit to reconnect have rendered it necessary to insert a resistance in the circuit. According to this invention, the armature and series field of the one motor are short-circuited on the series field of the other before they are disconnected to rearrange in parallel, and by this means the use of a resistance is avoided. Means for reducing the field strength during the period of short-circuit, in the case of compound-wound motors, are also provided. Three claims, two figures.

21,576/08. **Excess Load Meter.** H. Aron. A meter is described which only begins to register when the load exceeds a certain limit. It is a motor-driven meter, the driving torque of which is opposed by a spiral spring. When the torque of the meter exceeds a predetermined amount, the shaft is rotated; and to allow of its continuous rotation the spring is released automatically after each rotation. Small weights are lifted successively by a rotating portion of the meter so as to keep the backward torque as uniform as possible, and are arranged so that the backward torque is reduced to zero by a very small backward movement of the meter, thus rendering the locking of the meter-drive against backward movement unnecessary. Eight claims, three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Holman, 27,536/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Peck [A.C. distribution systems] 8,377/08; Ghadiali [Prevention of accidents due to falling of high-tension overhead wires] 16,415/08.

Dynamos, Motors, and Transformers: Pointois [Inductor alternators] 26,170/08; Akt.-Ges. Brown, Boveri, et Cie. [Cooling of enclosed machines] 7,203/09.

Electrometallurgy and Electrochemistry: Junger [Primary gas cells] 5,214/08 and 5,223/08; Hugot [Furnaces for manufacture of steel] 12,258/08; Moscicki [Production of oxides of nitrogen] 21,959/08; Heil [Primary cells] 24,006/08.

Ignition, Electric: Watt [Sparking-plugs] 9,020/08.

Incandescent Lamps: London Import Co., and Pordes [Portable lamps] 12,654/08.

Instruments and Meters: Fennell and Perry [Meters] 7,645/08.

Storage Batteries: Trin, 17,533/08.

Switchgear, Fuses, and Fittings: Scott [Lamp brackets] 5,719/08; Fennell and Perry [Limit-switch] 7,644/08; Fricker [Motor starter] 15,013/08.

Telephony and Telegraphy: Fleming [Oscillation detector] 13,518/08; Marconi's Wireless Telegraph Co., and Round [Apparatus for measuring wave-lengths] 26,588/08; Lake (*Gibson manufacturing Co.*) [Telephone mouthpieces] 5,706/09.

Traction: Conradi [Automatic braking system] 11,160/08; W. R. Sykes Interlocking Signal Co., and Sykes [Signalling] 16,262/08; Hanson [Rail joints] 18,841/08.

Miscellaneous: Marks (*Roberts*) [Heating] 8,093/08; Creffield [Electric gun-fire control] 8,346/08; Bergtheil [Mounting electric punkahs] 8,543/08; Siemens Brothers & Co. (*Siemens & Halske Akt.-Ges.*) [Fire-alarm installations] 22,410/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Reichel [Fire-alarms] 197/09; François [Measuring instruments] 7,198/09; Conrad [Transformers for vapour lamps and rectifiers] 7,630/09; Senftner [Arc lamp electrodes] 8,150/09; Soc. Ch. Legrand et Cie. [Railway signalling apparatus] 8,168/09; Allgemeine Elektricitäts-Ges. [Cranes and lifts] 8,456/09; Backus [Electroplating] 8,734/09; Baptifaut and Sydenham [Fire-alarms] 8,759/09.

Opposition to Grant of Patent

22,025/07. **Thermal Storage.** D. B. Morison. This specification describes a water heater for use in combination with a high- and a low-pressure engine, and an automatic regulating valve to pass the exhaust steam from the high-pressure engine, that is not required for the low-pressure engine, into the heater. The grant of the patent was opposed, but was allowed by the Comptroller, whose decision has been appealed against.

Expiring and Expired Patents

The following Patents expire during the current week after a life of fourteen years:—

9,167 of May 8th, 1895. **Automatic Telegraphy.** J. A. L. Dearlove. This patent is for apparatus by which the message is recorded as a perforated strip similar to that passed through the transmitting instrument, and can be used for further transmission.

9,442 of May 13th, 1895. **Air-insulated Cables.** G. M. Hardingham (*Felten & Guilleaume*). Cables are formed, according to this patent, by folding paper or other insulating material round the conductors so as to enclose them in separate channels or folds. The folding tools may be rotated to produce a spiral twist in the covering.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*W. S. Moody and W. R. Emmet*) [Water-cooled transformers] 1,017/01; British Westinghouse Electric & Manufacturing Co. (*Westinghouse Electric & Manufacturing Co., U.S.A.*) [Construction of slip-rings] 1,238/02; E. A. Carolan (*General Electric Co., U.S.A.*) [A.C. voltage-regulating system] 1,068/03; J. F. McElroy [Train-lighting dynamo and system] 1,095/03.

Electrometallurgy and Electrochemistry: G. Gin [Electrolytic production of aluminium and sulphur] 964/03; R. W. Stevens and B. Timmerman [Electric furnaces] 768, 769, and 770/04.

Ignition, Electric: F. R. Simms and R. Bosch [Magneto machine with oscillating armature] 712/00.

Incandescent Lamps: G. B. Francis [Lamp with rotating filament] 1,106/04.

Instruments and Meters: W. M. Mordey and G. C. Fricker (Meter with coin-freed mechanism] 1,251/02.

Storage Batteries: G. Phillippart [Circular plates] 1,194/98.

Switchgear, Fuses, and Fittings: E. A. Carolan (*General Electric Co., U.S.A.*) [Cartridge fuse with indicator] 1,060/03; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Traction-motor controller] 821/04.

Telephony and Telegraphy: K. Höflinger and C. Wolffhardt [Combined telephone receiver and transmitter] 1,205/04.

Traction: E. R. Hill [Arrangement of two insulated conductors] 916/01; J. S. Raworth [Control of tramcar motors] 716/04; British Thomson-Houston Co., H. N. Sporborg, F. W. Carter, and A. S. Cubitt [Multiple unit control] 818/04.

Miscellaneous: A. Schmid [Electromagnetic governor] 1,224/02.

Patent Record	452

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

In consequence of the breakdown of a tramway feeder cable in the Knott Mill district of Manchester, a water main crossing the iron pipe in which it was laid was made "alive," and this resulted in an outbreak of fire in two buildings through ignition of the gas supply. The fires were under control, however, before serious damage was done, and the tramway service in the district was restored in a few hours. (Page 433.)

Mr. C. C. F. Monckton describes the Lepel system of wireless telegraphy. It is claimed that a continuous train of slightly damped waves is produced by setting up, through the agency of a spark, oscillations in a circuit consisting of condensers and inductances in series avoiding a gap; also that, by superimposing a low-frequency wave on that of the high frequency and using a monotone telephone receiver, interference can be reduced to a minimum. (Page 434.)

An illustrated description of the "Z" Electric Lamp Manufacturing Co.'s factory near Wimbledon gives an account of the methods employed in the manufacture of these metal filament lamps. (Page 435.)

A method of electric lighting for motor-cars, &c., which forms virtually a miniature edition of the Leitner train-lighting system, has recently been introduced. (Page 440.)

Mr. A. M. Taylor writes with reference to the large battery to be installed at Manchester, and Mr. H. Brazil continues the correspondence on parallel runnings of alternators with earthed neutrals. (Page 440.)

The Electric Lighting Acts (Amendment) Bill was read a third time in the House of Lords on Tuesday. During the report stage on Thursday, several amendments were made, the most important being one restricting municipal authorities from hiring out or fixing electric wiring, fittings, &c., except through a contractor. (Page 440.)

It is stated that the Cavehill & Whitewell Tramways Co. intend to apply to Parliament for compulsory running powers over the lines of the Belfast Corporation. —The Highways Committee of the London County Council is to confer with the Board of Trade with a view to forming conciliation boards to deal with

Digitized by Google

matters concerning their tramway employees.—Stepney Borough Council have consented to the use of the overhead trolley system upon a small portion of the Aldgate-Bow route.—Once again the South Shields Corporation have refused to take any financial interest in the proposed electric railway under the Tyne.—The accounts of the Brighton Corporation tramways department for 1908-9 show a loss of £2,420.—A net profit of £836 is shown by the accounts of the Burton Corporation electricity department. (Page 441.)

THE London County Council require 200 electric tramcar bodies with equipments. Mains and circuit-breakers are required at Farnworth; mains at Leek; a 300-kw. generating set at Longton; and a 350-kw. generating set at Plymouth. Large electrical extensions are contemplated at Sheffield, West Ham, and Liverpool. Darlington Corporation have accepted the tender of Messrs. Belliss & Morcom for a 500-kw. exhaust steam turbo-generator at £2,660, and the Edinburgh Corporation, after discussion, have placed an order with the Lahmeyer Electrical Co. for cables at £6,544. The lowest British tender was £7,437. (Pages 442 and 443.)

THE accounts of the Brush Electrical Engineering Co. for 1908 show a debit balance of £29,128, after meeting debenture interest and providing for bad and doubtful debts. A net profit of £1,030 is shown by the accounts of the Clyde Valley Electric Power Co. (Page 444.)

IN a Paper read before the Institution of Electrical Engineers, on Thursday, Mr. H. S. Hallo dealt with the application of the motor-converter, and compared its properties with those of the motor-generator and rotary-converter. The principle of the machine and the methods of starting up were also fully described. The author showed curves which demonstrated the high efficiency at all loads and the possibility of pressure regulation over a wide range without seriously affecting the power factor, by varying the shunt excitation. The special arrangement of commutating poles on machines for three-wire systems was also dealt with. In the discussion, Dr. E. Rosenberg remarked that a wide range of voltage could be obtained on the d.c. side of a rotary converter without the use of a booster by employing tappings on the transformer, and that nowadays a direct-current machine corresponding to a frequency of fifty cycles per second was by no means a dangerous thing. Mr. B. M. Jenkin commented on the satisfactory results which had been obtained with motor converters in the Great Western Railway sub-stations, mentioning in particular the high over-all efficiency. He also gave some details of tests made to determine the effect of using the batteries on the over-all efficiency of the sub-stations and on the pressure regulation. Mr. T. Roger Smith also spoke highly of these machines. Mr. A. H. Seabrook and Mr. J. S. Peck spoke in favour of the rotary converter, claiming higher efficiency and greater reliability. Several written communications have been received, including one from Mr. K. Faye Hansen, stating that the high reactance claimed for the motor-converter is obtained quite easily for rotary-converters by suitable design of the transformers. (Page 447.)

UNDER ELECTROMETALLURGY and ELECTROCHEMISTRY is given an outline of the programme of the electrochemical section of the seventh International Congress of Applied Chemistry, which is to be held in London at the end of this month. (Page 450.)

AN apparatus for the production of oxides of nitrogen from the atmosphere is described in a patent specification by I. Moscicki. An arc is produced between electrodes fixed to the faces of a powerful electromagnet, and a rotating flame is produced, through which the air is passed. Among the other specifications published is one by A. Holman for a multiple-carbon arc lamp, in which both carbon holders are pivotted, striking and regulating being accomplished by means of a wedge moving between quadrants fixed to the swinging holders. A method of cooling enclosed machines by circulating the air through a cooling chamber integral with the bed-plate is described in a specification by Akt.-Ges. Brown, Boveri and Co. Opposition has been entered to the grant of patents to A. Holman for an arc lamp with disc electrodes, and to the Union Switch and Signal Co., U.S.A., for a system of block signalling for railways, in which adjacent sections are supplied with A.-C. currents differing in phase. In consequence of opposition, F. Harrison and C. H. Dorman have surrendered the right to a patent for a process for producing a compound of tungsten, carbon, and hydrogen. (Page 452.)

THE correspondence published in our columns on the question of the parallel running of three-phase generators with earthed neutrals has been marked by the expression of very diverse opinions. The experiences related and the opinions given in this correspondence, and also in the discussion on Mr. Rider's Paper at the Institution of Electrical Engineers, cannot fail to be of considerable help to engineers who are meeting trouble in this direction. In the first place, it has been pointed out that the triple-frequency circulating currents may not have quite such serious consequences as are sometimes attributed to them, as they do not increase the heating of the machine in the same proportion as a corresponding overload would do. Again, it has been shown that an alteration in the shape of the pole shoes of the generators may not in itself be sufficient to avoid the presence of a third harmonic in the E.M.F. wave-form at all loads, on account of the effect of armature reaction. In the case of a well-distributed winding and a rotor without salient poles, however, the effect of armature reaction would be to superimpose another sine curve on the main curve with a phase displacement determined by the power factor, and this would result in a sine wave E.M.F. at all loads. Although all our correspondents appear to agree that a special automatic switch, as used at Greenwich, would be too complicated and costly for a small station, the practicability of altering the wave-form of existing machines is doubted, and in most cases some alternative suggestion is made. A large number conclude that the best solution is to do without earthing altogether—at any rate, where the voltage is not excessively high. Mr. Chattock places this limit at 6,600 volts, and Mr. Roger Smith asserts that there has never been any trouble on the Great Western Railway 6,500-volt system, although the neutrals of the machines are not earthed. Mr. Brazil, however, in a letter published in this issue, favours earthing; but his conclusion is based on experience with an 11,000-volt system. Where the machines and cable system can stand the full line pressure to earth—and this may be said to be the case for pressures below 7,000 volts—it seems to be most satisfactory to do without earthing; above this pressure it appears that the best results are obtained by earthing the neutral of one machine only through a resistance—the carbon powder resistance described by Mr. Brazil appears to have advantages for this purpose—and trusting to the switchboard attendant to keep one machine earthed. Where this course is objected to and it is desired to earth all the

Digitized by Google

machines, it is suggested to insert choking coils in the earth connections, which, while offering high impedance to the triple-frequency currents, allow sufficient current to flow on the occurrence of a fault to trip the feeder cut-outs. Such choking coils would be expensive, however, and the highly ingenious combination of inductance and capacity proposed by Mr. Hollis even more so. The auxiliary apparatus with earthed neutral, permanently connected to the bus-bars as proposed by Mr. Brew, suffers from the same disadvantage. In conclusion we should like to refer to a Paper on this subject by Mr. G. I. Rhodes, an abstract of which was published in ELECTRICAL ENGINEERING of December 5th, 1907 (Vol. II., page 898). In this Paper the author relates how the troubles were successfully overcome in the case of a large three-phase system in America by earthing one machine only through a resistance, and trusting to the attendant to arrange the switches accordingly.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) **THURSDAY, MAY 13TH.**

Iron and Steel Institute.

10.30 a.m. Annual General Meeting at 2b Great George Street, Westminster, London.

Institution of Electrical Engineers.

8 p.m. Meeting at the Society of Arts, John Street, Adelphi. Paper to be read:—"Economies of Medium-sized Power Stations: A Study of Comparisons between Steam, Gas, and Oil Engines," by A. J. J. Pfeiffer.

FRIDAY, MAY 14TH.

Iron and Steel Institute.

10.30 a.m. Annual General Meeting at 25 Great George Street, Westminster, London.

7.30 p.m. Annual Dinner at the Hotel Cecil.

Physical Society.

8 p.m. Meeting at the Imperial College of Science, Exhibition Road, South Kensington. Papers to be read:—"On a Bifilar Vibration Galvanometer," by W. Duddell, F.R.S. "Effect of Temperature on the Hysteresis Loss in Iron in a Rotating Field," by W. P. Fuller and H. Grace.

Royal Institution.

9 p.m. Evening Discourse by Prof. G. E. Hale on "Solar Vortices and Magnetic Fields."

SATURDAY, MAY 15TH.

Institution of Electrical Engineers: Students' Section.

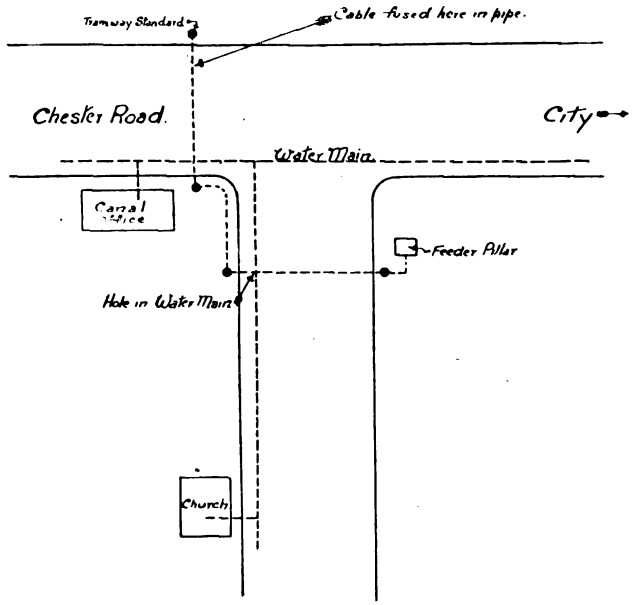
10 a.m. Visit to the Silvertown Works of the India Rubber, Gutta Percha & Telegraph Works Co., Ltd.

Junior Institution of Engineers.

Visit to the Works of the British Thomson-Houston Co., Ltd., Rugby.

Birmingham and District Electric Club.

7 p.m. Meeting at the Colonnade Hotel, New Street, Birmingham. Paper to be read:—"Illumination," by W. Smith.



Imperial College of Science and Technology.—Mr. A. A. Allen, one of the representatives of the London County Council upon the Governing Body of the Imperial College of Science and Technology, has resigned. Mr. Sidney Webb has been appointed to fill the vacancy.

New Direct Cable to Argentina.—For some time past the Argentine Government have been considering various projects for the construction of a submarine cable for the transmission of telegrams from Argentina by a more direct route than any now available. At present all messages from Buenos Ayres, Monte Video, or the Rio Grande are sent to this country *via* Brazil. According to the *Standard*, it has been finally decided that a new cable shall be laid direct from Buenos Ayres to the Island of Ascension, from there to Madeira, and from Madeira to Europe.

Claim against Dublin United Tramways Co. for £2,000 Damages.—In the King's Bench Division of the High Court last week, an action was heard before the Lord Chief Justice and a special jury, in which Mr. W. F. Thompson sued the Dublin United Tramways Co. for £2,000 damages for injuries received in a motor accident. It is claimed that at the corner where the accident took place the guard rail was dangerously higher than the ordinary rail, with the result that the car was upset. The jury awarded the plaintiff £500 damages, but the company have asked for a stay of execution with a view to appeal.

TRAMWAY FEEDER TROUBLES IN MANCHESTER

SOME excitement was caused in the Knott Mill district of Manchester on Saturday night by the breaking out in flames of the feeder cable on a tramway pole, and a series of explosions in adjacent section-boxes. Mr. S. L. Pearce, the chief engineer to the Manchester Corporation Electricity Works, has kindly sent us the following details and explanation of the disturbance: One of the branch armoured rubber feeder cables from a feeder pillar to the overhead wires broke down in an iron pipe laid under the tram rails. The armouring of these feeder cables, although bonded to the rails at the pillar box, was entirely fused through, and the pipe in which the cable was run was charged up. This pipe was unfortunately touching a water

SKETCH SHOWING RELATIVE POSITIONS OF CABLES AND WATER MAINS.

main, and in turn the latter became charged up. The water services into the church and Bridgewater Canal offices were therefore made 'alive,' and evidently sparked over on to the gas services into the respective buildings and fired the gas. There are no electric light services into either of the buildings concerned. The relative positions of the cables and water mains, the tramway pole, and the spot where the breakdown occurred are shown in the sketch above. The outbreaks of fire in the church and the Canal company's offices were got under by the Fire Brigade before much serious damage was done, however, and the tramcars were running again in a few hours. The main tramway service was, of course, not interfered with.

Postal Strike in Paris.—At a meeting of some 3,000 postal employees on Tuesday evening, a general strike was declared, and a large number of telegraph, telephone, and postal employees have already ceased work.

Stolen Guttapercha.—In the King's Bench Division on Monday, the Telegraph Construction and Maintenance Co., Ltd., sued Messrs Merchant & Co., of Camberwell, and Messrs. A. Cohen & Co., of the Borough, for the value of 207 cwt. of guttapercha, which it was alleged came into the hands of the two firms mentioned through the workmen of the plaintiffs, who were in the habit of stealing the material from their works at Greenwich. The *bona fides* of the defendants were not impugned, they being quite unaware that the guttapercha had been stolen, but the defendants denied the value placed upon it by the plaintiffs, viz., four shillings per pound for 207 cwt. The defendants had returned all the guttapercha obtained in this way which remained unsold, and judgment was given for the plaintiffs for 3s. 6d. per lb. for the 207 cwt., or £4.057 4s. and costs.

THE LEPEL SYSTEM OF WIRELESS TELEGRAPHY

By C. C. F. Monckton

WHEN a source of continuing electric energy is connected to two electrodes, and the pressure is sufficiently great for a spark to pass, an electric arc is formed and the metals are eaten away. In an ordinary system of radiotelegraphy the spark-gap is shunted with a condenser circuit, and this condenser circuit is first charged till the difference of potential across the gap is sufficiently high for a disruptive discharge to take place.

If the energy of supply be large and the gap small, the disruptive discharge is followed by an arc; so, in practice, the gap has to be made comparatively large for the energy of oscillations produced.

The Lepel arrangement appears to allow a large amount of energy to be used in electric radiation with a very minute gap; in fact, the gap appears to be only

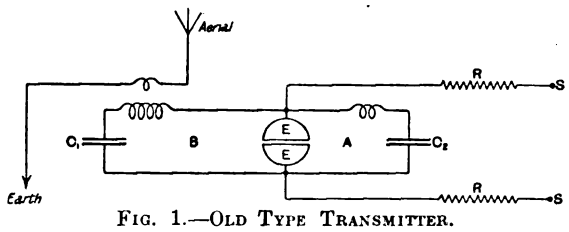

FIG. 1.—OLD TYPE TRANSMITTER.

a shunt, the oscillations occurring in a closed circuit of two capacities and two inductances in series.

One arrangement of the Lepel transmitter is shown in Fig. 1. A continuing source of electric energy *SS* is supplied to two electrodes *EE* through resistances *RR*; and these electrodes are separated by thin pieces of paper with a hole punched through the centre. These two electrodes are also connected to two oscillatory circuits *A* and *B*, having the same natural frequency, but with different capacities, C_1, C_2. It is found that a rapid succession of sparks takes place across the gap, gradually burning away the paper, oscillatory currents at the same time surging in the condenser circuits.

The action would appear to be something as follows: The condensers are charged till the sparking potential is reached; a spark passes, and a small por-

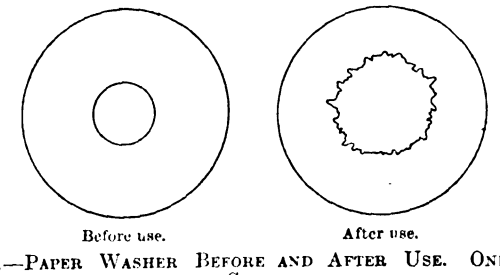

FIG. 2.—PAPER WASHER BEFORE AND AFTER USE. ONE-THIRD SIZE.

tion of the oscillatory energy probably follows the spark, but as the oscillation constants of the two circuits *A* and *B* are the same, and very slightly damped, the discharge tends to take place in the complete circuit with both condensers and both inductances in series. As this discharge hardly flows through the gap, the source of supply continues to charge the condensers instead of arcing across the electrodes. If sparking only took place at one point, the local heating would make the air between the electrodes conducting, and an arc would be formed. The action of the paper is apparently to keep the sparking points continually on the move.

The writer understands that in practice it is found that without the paper discs the spark travels straight to the circumference of the disc, and arcing then commences to take place.

In practice usually two discs of foreign note paper are used. In Fig. 2 a disc is shown before use and after two and a half hours' sending. It will be noticed that the spark has evidently been continuously travelling round the punched hole.

In Fig. 6 the case containing the electrodes is shown on the table to the left of the variable condensers and in front of the helix on the wall. As the electrodes are at the node of potential, very little insulation is required; but the heating from the oscillatory currents has to be provided for as well as the heating from the

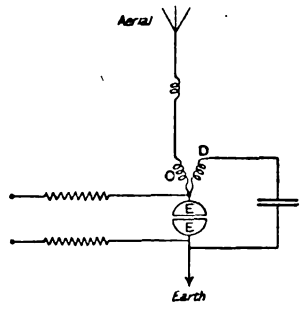

FIG. 3.—NEW TYPE TRANSMITTER.

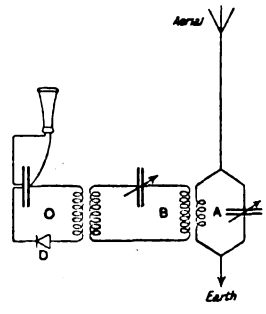

FIG. 4.—RECEIVING CIRCUITS.

spark. This is done by making the electrodes massive, and by water-cooling.

A screw adjustment of the case gives a fine adjustment to the spark-length.

With alternating current both electrodes are made of the same metal, but with direct current it is found best to use copper for the positive and delta metal for the negative electrode. The sparking gradually roughens the surface of the electrodes, and these have to be polished from time to time; but the writer was informed that those he saw working had been in use for six weeks with an occasional polish.

In Fig. 1 the radiating circuit is shown coupled induc-

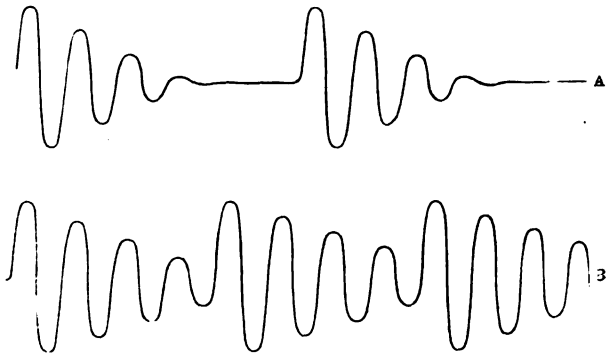

FIG. 5.—WAVE FORMS.

tively to the circuit *B*. The latest arrangement of transmitter is shown in Fig. 3, and it will be seen that the aerial circuit takes the place of circuit *B* in Fig. 1. It will be noticed that these circuits are doubly coupled —a very loose electrostatic coupling at the electrodes and a variable electro-magnetic coupling between the inductances *CD*. The writer understands that it has been found that, however fast this coupling *CD* is made, only one principal wave is detected.

The receiving circuits form a modified Stone arrangement; they are shown in Fig. 4. The circuits *A* and *B* are oscillating; circuit *C* is aperiodic. The detector *D* is usually of the thermo-electric type.

Digitized by Google

The general arrangement of apparatus is shown in Fig. 6. To the left are the transmitting apparatus. On the table are the choking coils, a mica condenser, 2½in. by 3½in. and ⅜in. thick, designed by Baron von Lepel, in conjunction with Dr. Burstyn; to the right is the electrode box, and behind it is the variable inductance, 18in. by 14in., in the condenser circuit. Behind this inductance is the helical inductance of the aerial circuit, which can be tilted so as to make a closer or looser coupling. Just above is shown a hot-wire instrument in the aerial. On the wall behind the variable condensers of the receiving circuits is the receiving transformer.

hot-wire instrument it would appear that 300 watts or more were being radiated.

If the wave form of an ordinary spark station be represented by curve *A* (Fig. 5), it is probable that a curve of the nature of *B* would represent that radiated from a Lepel transmitter.

The Syndicate at present are at work perfecting an arrangement for imposing a low frequency on the high-frequency oscillations, so as to give a musical note in the receiver, and thus to allow the use of a monotone telephone, which would take the place of the ticker of the Poulsen system. A large range of notes can now be transmitted from the Syndicate's Slough station.

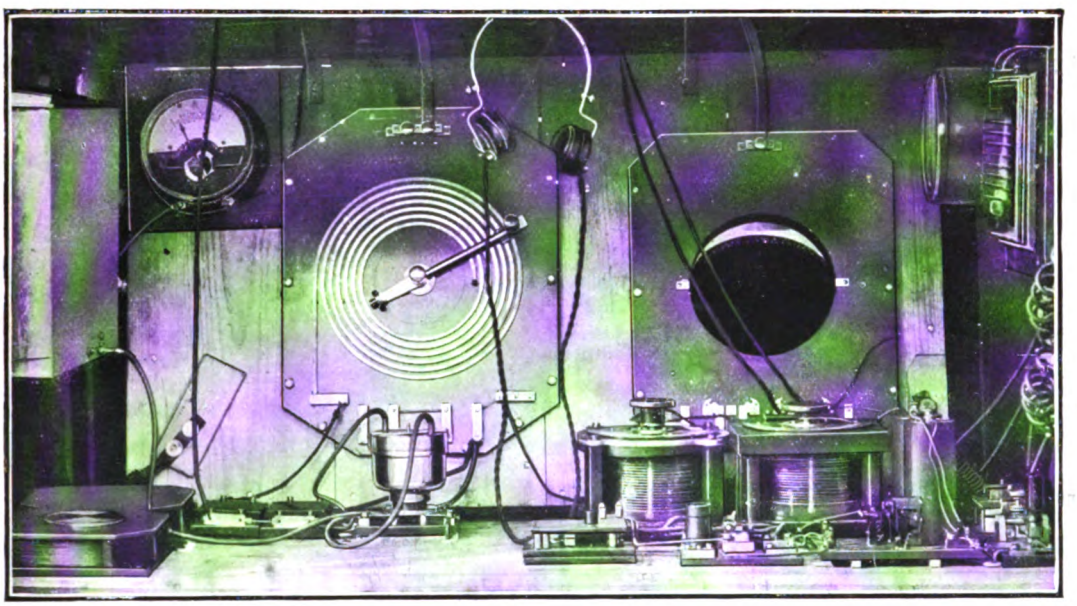

Fig. 6.—General View of Apparatus.

At the Twickenham station, which the writer saw through the courtesy of Dr. Erskine Murray, who has been consulted on numerous technical points by the Lepel Wireless Telegraph Syndicate, the energy was taken from the local electric supply company at a pressure of about 480 volts. A bank of incandescent lamps in series reduced the pressure across the electrodes to from 250 to 350 volts, and the current used was about 4 amperes. A 200-watt lamp held against the aerial was well lit, and from the reading of the

The writer was impressed by the smallness and simplicity of the apparatus for connecting the direct current supply into high-frequency oscillations, and the system should lead to considerably reduced cost for radiotelegraph apparatus. It was not apparent how syntonic the system is at present; but a very great improvement will be reached when most of the wave train can be cut out so that only that portion will be employed which will give a definite note in a monotone telephone receiver.

THE "Z" LAMP FACTORY

WE recently had an opportunity of visiting the factory at Southfields, near Wimbledon, where the new "Z" metal filament lamps are being manufactured. The "Z" lamp, like the majority of other tungsten lamps, is of the multiple filament pattern, and its filaments are of the hairpin shape, grouped round a central glass support and connected in series. At the pip end, the filaments are supported by carbon hooks attached to the centre stem by thin steel wires. The combination of steel wire and carbon hook forms a spring support which compensates for the expansion and contraction of the filament and at the same time damps the vibration. Fig. 1 illustrates the lamp itself and shows the position of these loops. The centre stem is a glass rod, to which are attached the steel wires mentioned above and the usual nickel supporting wires for the other end of the filament. The centre stem is attached to the foot of the lamp, which contains the leading-in wires to which the filaments are welded. A special salt, which prevents blacking of the lamp, is painted on the centre stem.

The "Z" Electric Lamp Manufacturing Co., Ltd., are proprietors of the British patents Nos. 14,411/01 [Sander], 9,384/04 [Elektroden-Gesellschaft], 2,554/06 [Zerning], 21,654/06 [Hollefreund], and 20,233/07 [Zerning]. Two of these, it is seen, relate to inventions by Zerning, the initial letter of whose name, and the fact that zirconium is used during the process of manufacture, probably suggested the trade name "Z" for the lamp. The filaments, in their finished state, are nearly pure tungsten. They are made at a second factory of the company in Willesden, which is set apart entirely for this work. This factory we were not privileged to inspect.

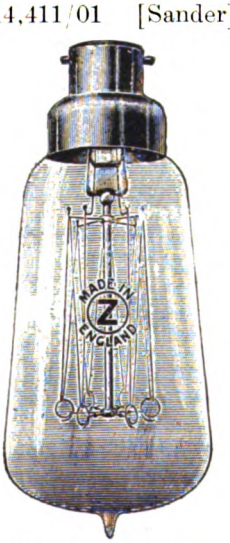

Fig. 1.—The "Z" Lamp.

The factory at Southfields, acquired by the company twelve months ago, had been originally built by the Berrenberg Lamp Co. Considerable alterations

Digitized by Google

were made in it, and adjacent land was secured for extensions. The total area of the site is about two acres. Fig. 2 indicates the general arrangements of the ground floor of the works. The building consists of two portions: the front portion is in two storeys, with the engine-room, offices, and fitters' shop, in which are the main vacuum pump and the main air compressor, on the ground floor, with the lamp exhausting department above; and behind this the actual manufacturing and assembling of the lamps is carried out in a single-storey building 200ft. long by 50ft. wide.

The engine-room is equipped with a 100-h.p. Hornsby water-tube boiler and a 100-h.p. compound Ball and Wood engine running condensing. The engine is arranged

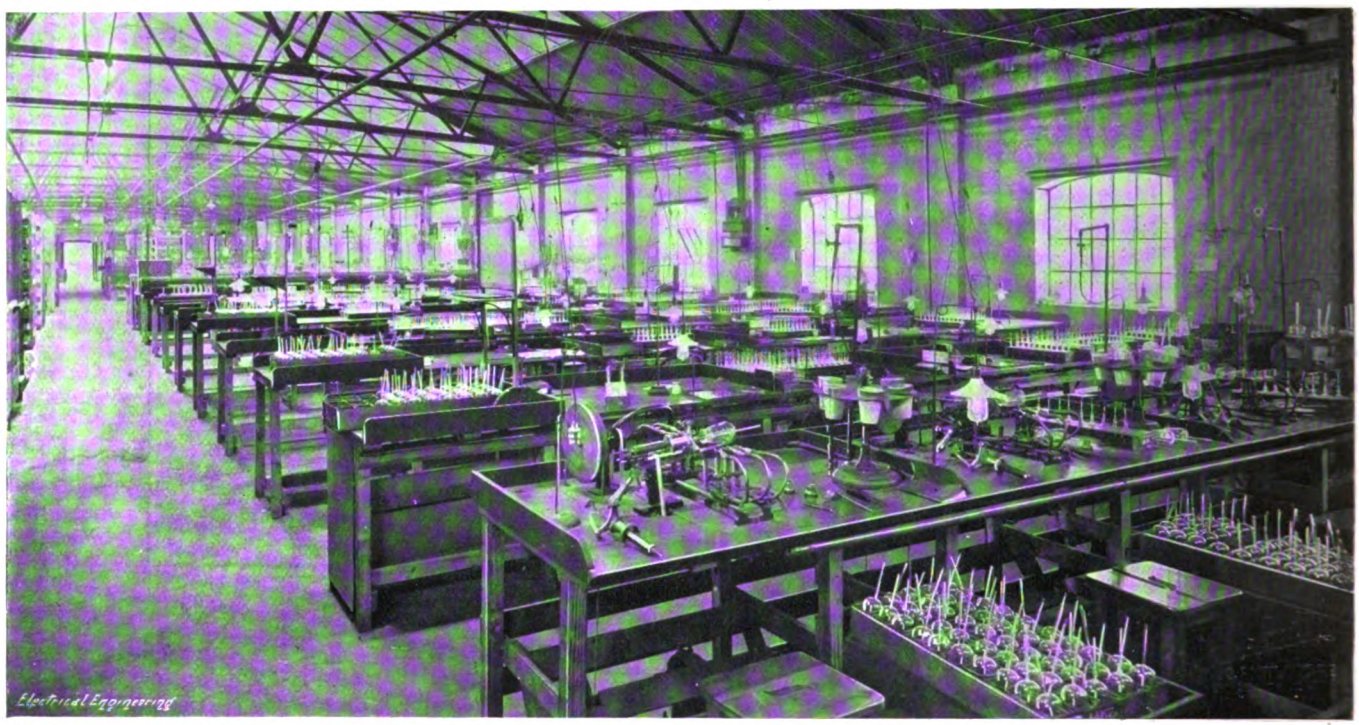

Fig. 3.—General View of Main Shop.

to drive a 45-kw. single-phase alternator and exciter, as well as the counter-shaft. In addition to the main engine, there is a 15-h.p. gas engine and a 7½-h.p. motor generator. All the auxiliary machinery in the

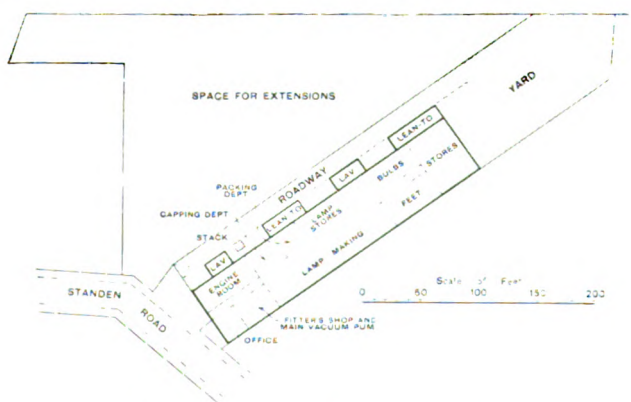

Fig. 2.—Plan of Factory and Site.

shops is driven electrically, and very shortly the main pumps and tools in the fitters' shop will be driven in the same way, thus avoiding the use of the main counter-shafting.

In visiting a metallic filament lamp factory, the most striking point is the immense amount of detail and the large number of operations which have to be performed. There is a marked difference between the metal filament lamp and the carbon lamp in this respect, and the higher price of the new lamp is not alone accounted for by the extra cost of manufacturing the filament and the profit necessary to pay an adequate return on the large amount of initial experimental work that has been involved. Added to this, with such a large number of operations, the opportunities for breakage and bad workmanship are enormous, and the greatest care and supervision is required before the lamp making can be a commercial success. In the "Z" lamp factory we are informed that the breakage has been brought down to a figure which is exceedingly small. This, we understand, is partly due to the strength of the filaments, but it is also largely influenced by the system of control and inspection, the details of which have evidently been very carefully worked out. The skill and dexterity of the girls employed by the company is very great, and reflects great credit on the foreman responsible for their instruction; and the organisation of the methods of control is such that, when the lamps are finally tested, any defect in any part of the lamp can be immediately traced back and the worker at fault identified.

We will now follow out the process of manufacture, which we are able to illustrate with photographs taken in the shops.

At the lower end of the main shop are situated the stores, to which all the raw material is delivered for issue as required. Adjacent to the stores are the foot-making and bulb departments, where the parts common to all the lamps are made up. The bulbs are taken from the stores to the bulb department, where they are washed and dried, stemmed and opened, and they are then passed on to the sealers-in. Stemming consists of fixing a glass tube for exhausting at the end of the bulb, which is subsequently drawn down to a "pip" after the lamp is exhausted, and "opening" is the process of opening out the other end of the lamp into the requisite shape for receiving the foot.

In the foot-making department the leading-in wires are made, the central rods are made and fitted with the nickel wires which are to hold the filaments at their base, and the foot-glass is cut, flanged, and made

Digitized by Google

up into finished feet. In this department there is a novel machine for cutting the flanged glass, and also some very neat flange-making machines, which were specially designed by Mr. H. Hoge, the manager of the company's works at Willesden. When finished, the feet pass into the "finished part" store, where they are examined and issued to the lamp makers. The arrangement of the factory is such that the progress of the work is continuous. The foot-making department is on the same side as the lamp-making department, so that the work passes straight ahead. Fig. 3 is a general view of the main shop, with the sealing-in table (to be referred to later) in the foreground; and Fig. 4 shows the foot-making department.

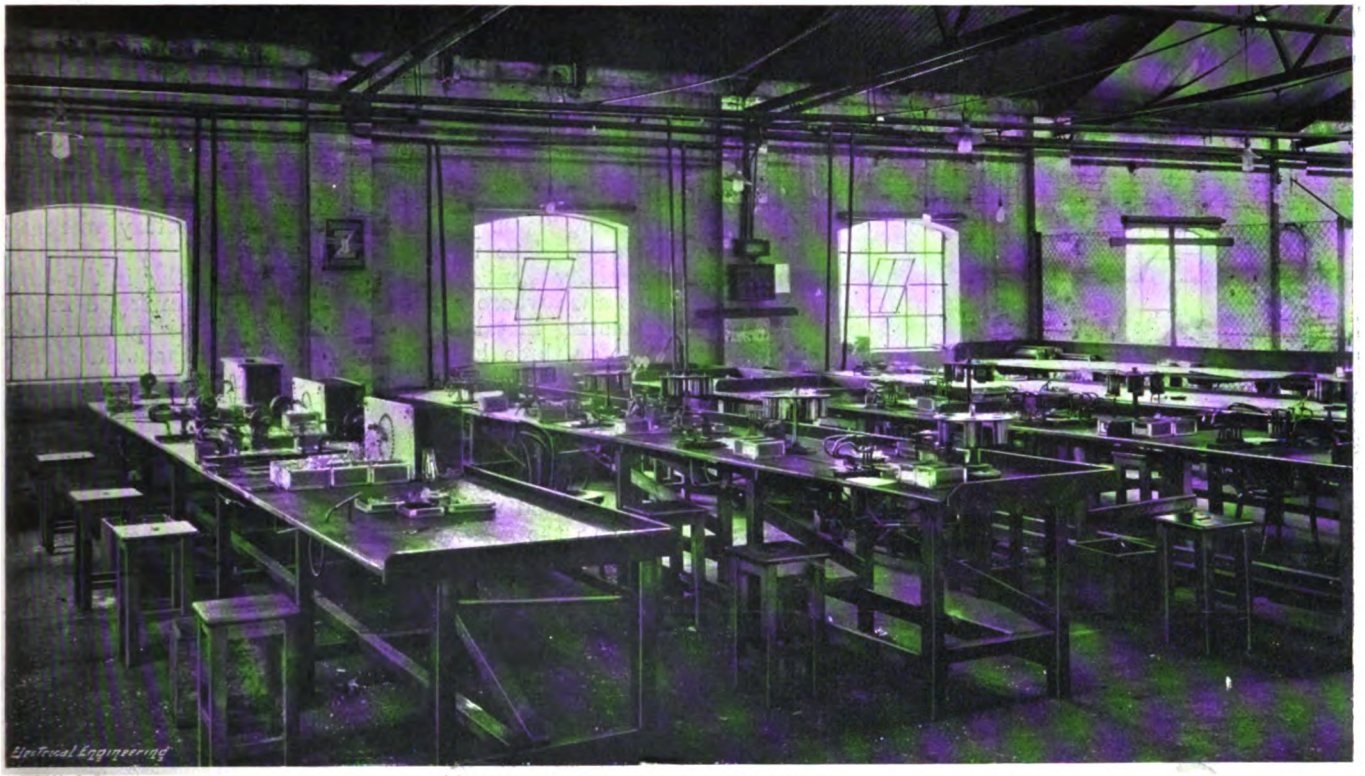

Fig. 4.—Foot-making Department.

Fig. 5 is a view giving a portion of the lamp-making department in greater detail. The feet, as issued from the "finished part" store, consist, as already explained, of a flanged glass foot, with the leading-in wires and the centre rod with the necessary nickel wires. The carbon hooks and the filaments have still to be

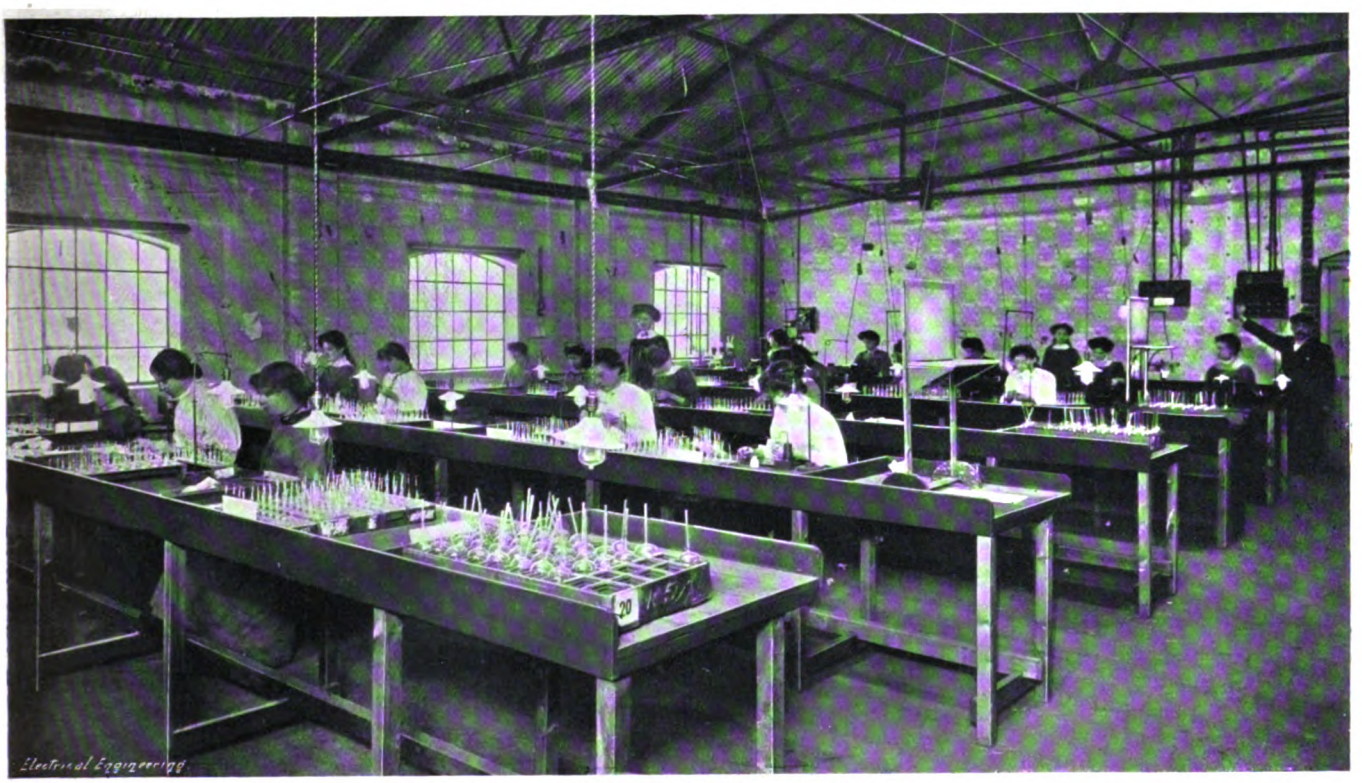

Fig. 5.—A Portion of the Lamp-making Department.

Digitized by Google

mounted and the filaments welded to the leading-in wires and upper nickel supports before the foot is

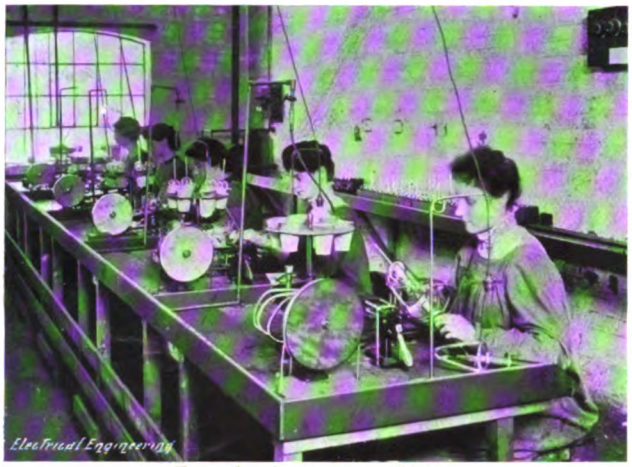

FIG. 6.—SEALING-IN TABLE.

finally inserted in the bulb and sealed in. This involves a large number of processes, but the tables are so arranged as to secure the minimum amount of handling with the maximum supervision. Fig. 6 shows the sealing-in table, to which the feet, mounted, complete with their filaments, are brought and sealed into the bulbs, after which the lamp is again inspected and tested before passing to the exhausting department.

Owing to the fine work involved in mounting the filaments, and during the lamp-making generally, very concentrated light is required, and as each worker has her own fancy regarding the position of the light, the "Z" company have adopted a very simple and effective system of lighting, which is clearly shown in the photographs.

We also noticed that throughout the lamp-making there are several small "rigs" for carrying the filaments, &c., all tending to simplify and accelerate the work.

The exhausting department is one of the most interesting in any lamp factory. Two types of pumps are employed by the "Z" company, the large "Berrenberg" pump and the more usual rotary mercury pumps. The use of the "Berrenberg" pump is particularly mentioned, as we believe that this is the only instance where a mechanical pump is employed in exhausting metal filament lamps. On this pump some two or three hundred lamps can be exhausted simultaneously, instead of ten or twelve with the ordinary rotary mercury pump. We understand that, as a result of several improvements which have been introduced into the "Berrenberg" pump, a vacuum is now produced as high as with the ordinary forms of mercury pumps, and without sacrificing the high working speed due to the great capacity of the "Berrenberg" pump already referred to. During the pumping stage the lamps are subjected to great external heat, and at the same time are considerably over-run. The use of the special chemical on the stem prevents any blackening at this stage, as well as during the life of the lamp. The mercury pumps are arranged in two batteries, and a third battery is being erected. They are of the "Gaede" type, and each pump is electrically driven.

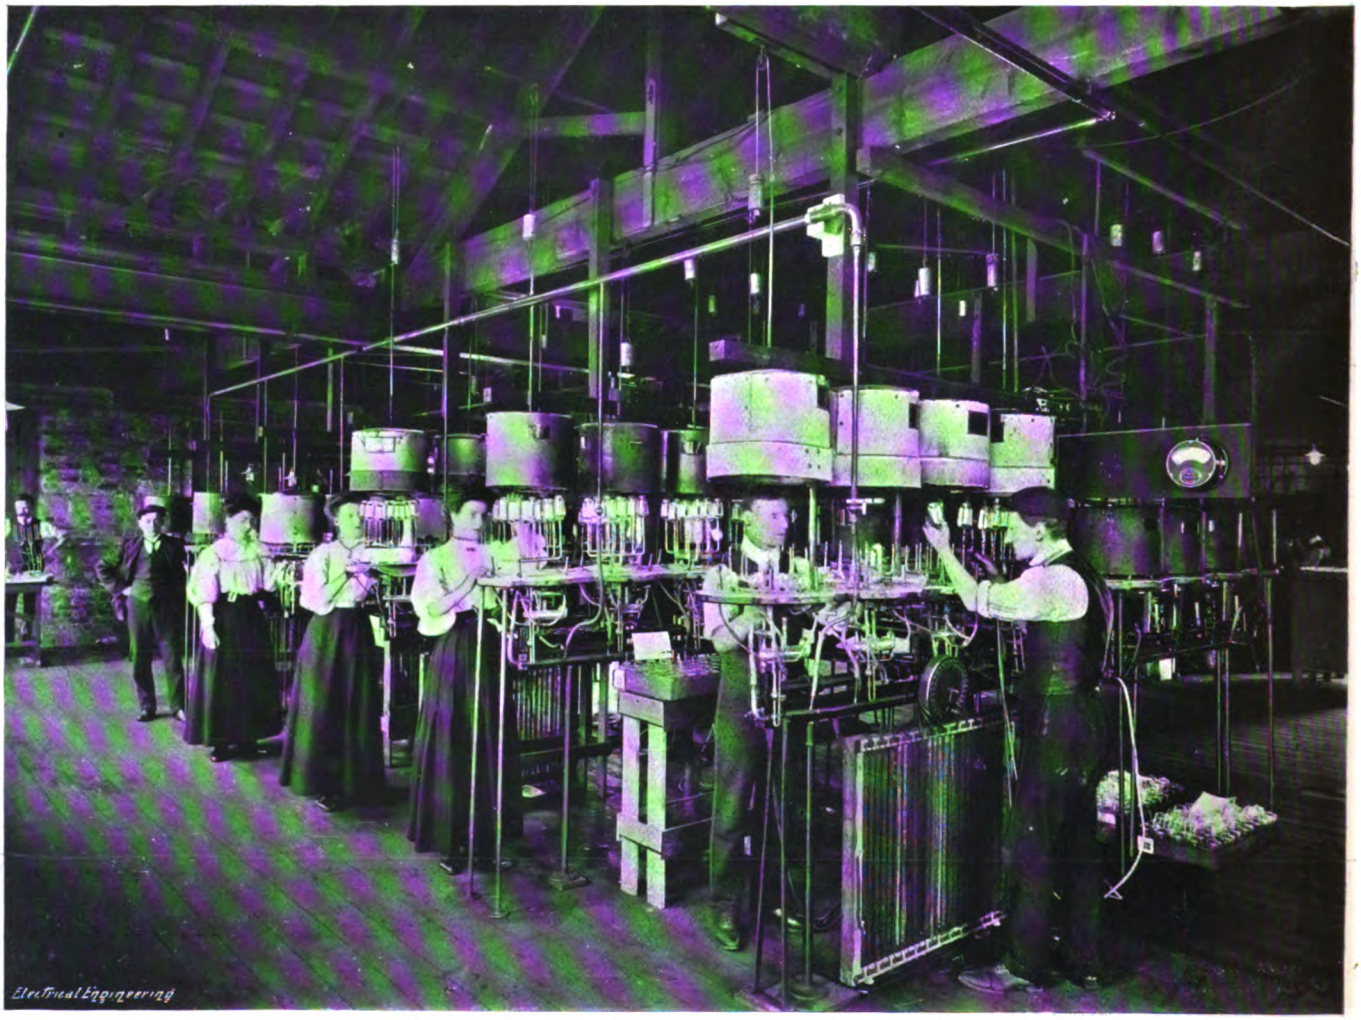

FIG. 7.—ONE SIDE OF THE EXHAUSTING DEPARTMENT.

Digitized by Google

After pumping, the lamps are tested on a screen for from one to two hours, where they are kept under observation both at their normal voltage and over-run. The vacuum is tested by the spark method, both during and after the pumping, and the greatest care is taken to ensure that the highest vacuum possible is obtained. Throughout both the exhausting and screening operations, the amount of over-running is carefully controlled. Auto-transformers are used on the benches to avoid excessive losses in resistance, and voltmeters are provided, so that the temperature of the filament is not left to be determined merely by the eye of the operator.

After screening, the lamps are sent down to the main shop for capping and testing. All lamps are capped with waterproof cement, and special capping machines are employed.

The method of photometry employed calls for no special comment, except in the case of the arrangement for series testing in the case of 100-volt lamps. Instead of series numbers, each lamp is given an index

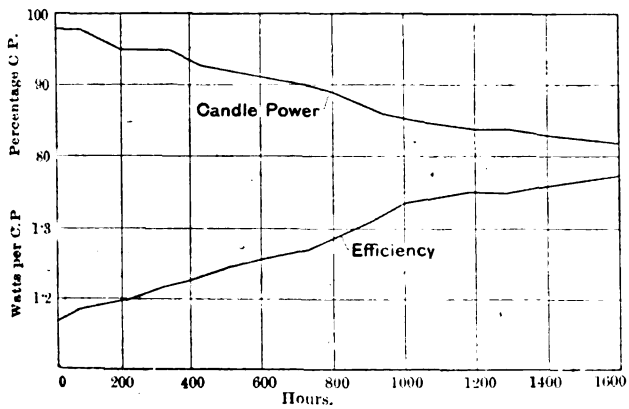

Fig. 8.—Typical Life Curve.

letter from A to H, and any two lamps bearing the same letter may be paired in series on 200-volt circuits. It is to be hoped that this series testing and marking will soon be an almost unnecessary part of a lamp-testing department, for the company is already making a 200-volt lamp, and 16-c.p. 100-volt "Z" lamps may be expected shortly. At present the standard sizes suppliable in trade quantities are: for 25 volts, 8 to 20 c.p.; for 50 volts, 10 to 30 c.p.; for 100 to 130 volts, 30 to 50 c.p.; and for 200 volts, 40 to 60 c.p. Lamps of larger candle power can be supplied provided notice is given before delivery. The efficiency is seen from a typical life curve which has been sent us by the company (Fig. 8). From this it will be remarked that the candle power is maintained above 80 per cent. of the initial candle power after 1,600 hours of burning, and that the initial efficiency is shown at about 1·15 watts per candle, and remains at a very satisfactory figure throughout the life, there being only an average loss of 1 per cent. in efficiency and candle power for each 100 hours of burning. The curve shows the test carried to 1,600 hours, but we are informed that lives of over 2,800 hours have been recorded both on the test-rack and in actual practice.

We are indebted to Mr. W. Pakenham, the general manager of the "Z" Electric Lamp Manufacturing Co., Ltd., and to his assistant, Mr. Downes, for their courtesy in showing us over the works at Southfields and for providing us with the photographs with which this article is illustrated.

Birmingham Section of the Institution of Electrical Engineers.—At the annual general meeting on Wednesday, May 5th, at the Grand Hotel, Birmingham, the officers and council proposed (see Electrical Engineering, April 15th, page 356) were declared duly elected. The adoption of the annual report was proposed by Prof. Kapp and seconded by Mr. Wilmott, and votes of thanks were passed to the University of Birmingham for allowing the use of their premises for meetings and to the retiring chairman.

ELECTRIC LIGHTING FOR MOTOR CARS, ETC.

We have received particulars from Messrs. C. A. Vandervell & Co., of Warple Way, Acton Vale, W., of an interesting method of electric lighting for motor cars, motor boats, &c., known as the C.A.V. system. The arrangement is practically a miniature edition of the well-known Leitner patent train lighting system, with a special constant voltage variable speed dynamo, in conjunction with accumulators, adapted to the particular requirements. It is needless to point out the advantages of convenience and cleanliness of electric light for motor car lamps, and it is claimed by this system that these advantages can even be extended to the head lights ordinarily using acetylene without taking an undue portion of the power of the engines. Electric lamps have a special advantage in this connection, due to the greater ease with which the light can be concentrated at the proper focus compared with gas flame.

The C.A.V. system aims at providing a self-contained and entirely automatic outfit on the car which is always ready for use, and does not require the removal of the accumulator for charging. The essential items of the equipment comprise the variable speed dynamo, an automatic switch, and a small battery. The dynamo is similar in construction to the Leitner train lighting machine, in which the regulation is effected purely by the employment of two subsidiary brushes, between which and the main brushes the field windings are connected. A simple shunt winding only is employed. A practically constant voltage of about 8 volts is obtained at any speed from 580 to 3,500 r.p.m., and the maximum output is 6 amperes. The machine can be driven direct or by gear or chain from any shaft on the car. The over-all length is under 1 ft., the diameter is only 6½ in., and the total weight of the machine is approximately 26 lb. The machine is completely enclosed, but inspection doors are provided. Radial carbon brushes are used.

The function of the automatic switch is to connect or disconnect the battery to or from the dynamo according as the voltage of the latter exceeds or falls below that of the former. The action of the switch is entirely electromagnetic, and is controlled by the conditions of voltage, and not by the speed of the dynamo, so that the state of the battery is taken into account. This part of the apparatus is contained in a compact teak case for mounting on the dashboard or elsewhere, and can be combined with the main lamp switches. Special means are provided by an auxiliary piece of apparatus to adjust the dynamo output to suit the conditions and to ensure that the cells shall not be over- or under-charged. This "output adjuster" takes the form of a graduated resistance in the field circuit of the dynamo. Another refinement of the system is the provision of a positive temperature coefficient in series with the lamp circuit when the cells are being charged to steady the lamp voltage. All the necessary switches, fuses, &c., including the automatic switch, can be combined on a compact switchboard on the dashboard together with the ignition switches, if the battery is also employed for ignition.

"Z" Electric Lamp.—In a recent issue we mentioned that an action was pending between the "Z" Electric Lamp Syndicate, Ltd., and Mr. S. Zossenheim, sole agent in Great Britain of the "Econo" electric lamp, for infringement of patent, and that the "Z" Electric Lamp Syndicate was granted an interim injunction pending the trial of the action. On Saturday, judgment was given by default against Mr. Zossenheim, perpetually restraining him from importing or selling electric incandescence lamps which constitute an infringement of the "Z" Company's rights under their patent No. 21,654 of 1906. The patent in question covers the use of a certain phosphorous preparation on the central glass stem of the lamp to prevent blackening of the bulb.

The International Electrotechnical Commission.—The transactions of the Council meetings of this Commission held in London last October have now been published, and can be obtained from the General Secretary, Mr. C. le Maistre, of 28 Victoria Street. A full report of the proceedings of the meetings, to which, it will be remembered, the Press was not admitted, is given on opposite pages in French and English. The work of the Council appears to have been of a preliminary nature, and the results would seem to be confined to the passing of a few somewhat formal resolutions, but it is claimed that these resolutions have laid the foundations of future work of great utility. We are asked to state that due to the efforts of Signor Guido Semenza, of Milan, the Italian Electrical Society has now decided to join in the work of the Commission, and is forming an Electrotechnical Committee, the President of which will probably be Prof. Luigi Lombardi, of the Technical School at Naples; that an Electrotechnical Committee has now been formed in Belgium, with the assistance of the Government, the President being Prof. Eric Gérard, and the Secretary Monsieur L. Mittewie, the Secretary of the Electrical Section of the Chamber of Commerce; and also that a Brazilian Committee has been formed in Rio by the Brazilian Government, under the Presidency of Prof. H. Morize.

CORRESPONDENCE

ACCUMULATORS FOR PEAK LOADS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—It is needless to say that the information which you publish in your issue of the 6th inst. is very gratifying to me. Through Mr. Pearce's courtesy I have, for some time past, known what was going on at Manchester; and it has been a great satisfaction to me that so distinguished an engineer should have accepted, in the main, the views which I put forward at Nottingham only a year ago, and which, in season and (I fear) out of season, and under mixed toleration and condemnation, I have consistently rammed home, till some of my friends have playfully dubbed me the "apostle" of electric storage!

I have hopes that, in the course of a month or two, Manchester will not be the only large station to commit itself to a peak load battery policy; and meanwhile I can afford to possess my soul in patience—only wishing, however, that the L.G.B. would give longer loans on batteries than they do!

Yours, &c.,

A. M. TAYLOR.

King's Heath, Birmingham.
May 8th, 1909.

PARALLEL RUNNING OF THREE-PHASE ALTERNATORS WITH EARTHED NEUTRALS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—This subject appears to have created a great deal of interest among your readers, if one may judge from the number of letters received, and as the question is one of considerable importance, I should like to make a few comments in the hope that further interesting points will be brought out.

The experience I have had with a 10,000–11,000-volt three-phase system, makes me very strongly in favour of earthing the neutral point; further, as by earthing through a resistance the current that flows to earth when a fault occurs is kept within limits, I think the resistance is very desirable. The function of this resistance is to limit the current to earth, but it must be low enough (3·5 ohms at the Greenwich power station) to allow sufficient current to pass to trip the circuit-breaker, even when the fault occurs on the end of the longest feeder. With the usual type of resistance, the ohmic value is lowest when cold, and increases as it heats up; it is therefore clear that at the moment a fault occurs, the current to earth is at its maximum, and the shock to the system may, if the resistance is low, be severe. With the carbon powder resistance I suggested during the discussion of Mr. Rider's Paper the contrary is the case, the ohmic value being highest when cold and decreasing as it heats up; we can therefore afford to have a resistance whose ohmic value when cold is very much higher than with the ordinary type. Assuming that a resistance decreases to one-fifth of its original value, and that it then reaches the 3·5 ohms which Mr. Rider advocates for his system, it is clear that the ohmic value when cold will be 17·5 ohms, and therefore when a fault occurs, the current to earth will be only one-fifth of what it would be if the ordinary resistance were used. If the current passing to earth is not sufficient to trip the circuit-breaker, the resistance will automatically decrease until sufficient current flows to effect this purpose, and this latter current—if the circuit-breakers act properly—should be the maximum that passes to earth under any conditions.

Mr. Peck in a letter which appeared in your issue of the 29th ult., asks for some further particulars of this carbon powder resistance, and as these details may interest others, I have pleasure in giving them. The complete resistance is made up of a number of units connected in series and parallel according to the requirements as to ohmic value and capacity. Each unit consists of a shallow fire-clay trough, the internal measurements being approximately 20 in. by 6 in. by 1 in., filled to a depth of about ⅜ in. with the special carbon powder. This powder, which, together with the troughs, is made by the Morgan Crucible Co., is chemically pure carbon made from the finest materials, such as are used for crucibles, and is capable of remaining for some considerable time at an exceedingly high temperature without being injured. The fire-clay troughs are also of a highly refractory material, and will stand the great heat without being affected. Carbon terminals are provided, extending right across the troughs, stepped down so as to allow the carbon powder to rest on top, and thus provide good contact between powder and terminal. The greater the temperature to which a resistance material can safely be raised, the greater the amount of energy which can be disposed of by an apparatus of a given size. The temperature to which this carbon powder attains is far above that which other types of resistance are capable of standing, and the capacity for a given area is therefore correspondingly great. As an example, the trough I have mentioned above will dispose of 30–40 kilowatts for a minute or so, and 12–15 kilowatts for 10–30 minutes. In reply to Mr. Peck's further request for particulars of the behaviour of this resistance with an earth on one phase and a fairly high setting of the time limit circuit-breaker (I presume the high setting refers to the time), I would suggest that as the rate at which the resistance decreases in value can be varied within large limits, it is only a question of designing to suit the special circumstances. In any case, the carbon powder resistance is beneficial, as during the time that elapses before the time limit device allows the circuit-breaker to operate, the load on the station due to the fault will be only a fraction of that when the ordinary resistance is employed.

Mr. Clarke, in the discussion on Mr. Rider's Paper, mentioned that they had had to design a new earthing resistance for Lot's Road, and this was to absorb 6,000 kw. for ten minutes. I cannot conceive why it should be necessary for the resistance to absorb such a large amount of power and for such a comparatively long time, and I am sure it would interest your readers if Mr. Clarke would give some particulars of the circumstances under which this is necessary. With regard to the circulating currents between the neutrals, the idea I suggested at the Institution meeting, which has also been independently proposed by Dr. Sumpner, and possibly by others previously, viz., to put choking coils between the neutral points and a common bus-bar, is, I think, far preferable to attempting to alter the wave form of the alternators, especially as your correspondent, Dr. Thornton, suggests that not only the wave form but the excitation and proportion of load must be the same.

I am afraid I cannot agree with Mr. O'Brien, when he states that it is satisfactory to provide an ordinary knife switch and rely upon the switchboard attendants to always keep one running machine's neutral earthed; I feel sure that the system under these conditions would sometimes be left without the neutral being earthed, and my experience is that when this is done with a system which normally has the neutral earthed, very high pressures may arise which may do considerable damage to machines or cables.

Yours faithfully,

H. BRAZIL.

Beckenham, May 10th, 1909.

PARLIAMENTARY INTELLIGENCE

Electric Lighting Acts (Amendment) Bill

This Bill was further dealt with, on the report stage, in the House of Lords on Thursday. We dealt with the amendments made when the Bill was being considered by the House in Committee in our issue for April 29th, p. 395.

A number of further amendments were made, including the following. Lord Avebury proposed an amendment which would put upon local authorities the necessity for complying with the recommendations of an auditor, in the same manner that companies are under Clause 13. Lord Avebury's object was to secure a more uniform provision for depreciation, but Lord Hamilton thought the amendment outside the scope of the Bill, and might jeopardise its chance of becoming law. This being the general feeling, the amendment was withdrawn.

Lord Avebury moved an amendment to Clause 16 (power of undertakers to provide electric fittings), providing that where the undertakers were a local authority they might "through a contractor, but not otherwise," provide, let for hire, and fix, repair, and remove, but should not manufacture lamps, meters, electric lines, fuses, switches, fittings, lamp-holders, motors, and other fittings for lighting and motive power. This was agreed to, with the addition that if within three months after obtaining a loan for the purpose, there should be no electrical contractors within the area of supply, then the local authority should exercise the powers of this section. A section was also added dealing with penalties for non-compliance with certain sections of the clause.

Although the Board of Trade opposed it, an amendment by Lord Balfour of Burleigh, providing that where a main road is carried over a railway by a bridge maintained by the railway company, the rights, privileges, and exemptions conferred on county councils (Clause 22) shall, for the purposes of rebuilding, widening, or repairing the bridge, be extended to the railway company, was agreed to without a division. The Bill was read a third time on Tuesday.

Digitized by Google

PROGRESS OF ELECTRICAL BILLS.—The Torquay and Paignton Tramways Bill was read a second time in the House of Lords on Thursday.

The Anglo-Argentine Tramways Bill was read a third time and passed in the House of Commons on Monday.

The Yorktown and Blackwater Company's (Electric Lighting, &c.) Bill was read a third time in the House of Commons on Friday.

NORTH METROPOLITAN ELECTRIC POWER.—This Bill was before a Committee of the House of Lords last week, and was reported for third reading. The object of the Bill is to include the districts of Hendon, Finchley, Friern Barnet, Hornsey, Walthamstow, Chingford, and Waltham Holy Cross within what is known as the "special district," viz., that in which the company may supply to power consumers under the terms of the Kitson Clause. This company will be remembered as one which commenced operations as a "bulk" supply company to municipalities, a limitation which, it was realised, seriously handicapped its operations. In 1907 a Bill was passed which created a "special district," in which supply could be given as above stated, and the present Bill adds to the "special district." In fact, the districts now included were cut out in 1907 at the instance of the Board of Trade owing to the London County Council Power Bill. General powers are also taken in the Bill for the erection of overhead wires under the usual conditions, and for supply for traction purposes, whether with or without rails. The raising of additional capital to the extent of £250,000 is also authorised by the Bill. The only opposition was from the West Ham Corporation, who objected to the company having powers to light railway stations.

FOLKESTONE, SANDGATE & HYTHE TRAMWAYS.—This Bill is now under consideration by a Committee of the House of Commons. It seeks to authorise the National Electric Construction Co. to adopt the overhead trolley system upon the proposed tramways between Folkestone, Sandgate, and Hythe instead of the surface-contact system, which was agreed upon with the various local authorities when the powers to construct the lines were granted a few years ago. A fuller report of the proceedings will be given in our next issue, but in the meantime it may be mentioned that the National Electric Construction Co. have placed before the Committee a letter from the Board of Trade, which states that the Board is not prepared to grant a permanent licence for the use of the Dolter system upon the Torquay tramways. This was put in in order to show the Committee that the request to abandon the use of the Dolter system upon the Folkestone tramways is a reasonable one. The Bill is opposed by the local authorities concerned.

NORTH-WEST LONDON RAILWAY.—This Bill has been under consideration by a Committee of the House of Commons for several days. It proposes to abandon that part of the authorised line between Edgware Road and Victoria, and to join the line from Cricklewood at Edgware Road (Chapel Street) with the Baker Street & Waterloo Railway. A through service of trains would then be run from Cricklewood to the Elephant & Castle. The British Electric Traction Co. have taken the matter in hand, and by the proposed abandonment calculate that the capital expenditure involved would be only £1,200,000 instead of £3,000,000, the Baker Street & Waterloo Railway Co. providing the necessary rolling stock. Evidence has been given by Mr. E. Garcke and Sir Charles Rivers Wilson, of the British Electric Traction Co., Sir George Gibb, Chairman of the Underground Electric Railway Co. of London, Ltd., and Mr. Cecil Braithwaite, stockbroker, all of whom expressed their confidence in being able to find the capital. There is opposition to the scheme by the Great Western Railway Co. and the Metropolitan Railway Co.

STATUE OF LORD KELVIN IN BELFAST.—In the House of Commons on Thursday, Captain Craig asked the Chief Secretary for Ireland whether the authorities of Queen's College, Belfast, had applied for an amendment of their charter authorising the dedication of a portion of their ground as a site for the statue of the late Lord Kelvin subscribed for by the citizens of Belfast and others; whether he was aware that the Corporation of the city was prepared to dedicate the necessary ground for the site of the statue within the grounds surrounding the new city hall; and whether in these circumstances the Government would refuse to sanction any alteration of the charter or additional power being given to the authorities of Queen's College, in view of the fact that a large majority of the subscribers desired the statue to be placed within the grounds of the new city hall. Mr. Birrell said the matter had not come under his notice, but he would give it careful consideration so far as he had control.

LONDON UNITED TRAMWAYS.—A Committee of the House of Lords, presided over by Lord Ludlow, has had this Bill under consideration since Tuesday. Briefly, it proposes to postpone the date upon which the London County Council can purchase the company's lines in Hammersmith, and seeks to acquire running powers over certain lines of the London County Council where the two systems meet at the county boundary, and offers reciprocal running powers to the Council over certain lines of the company. Both the London County Council and the Middlesex County Council are opposing the Bill.

LOCAL NOTES

BELFAST: *Gas and Electricity Committees.*—A proposal to amalgamate the Gas and Electricity Committees, which was on the agenda paper for the last meeting, was withdrawn.

Cavehill and Whitewell Tramways.—Consequent upon the rejection by the Corporation of the proposed agreement with the Cavehill & Whitewell Tramways Co., it is stated to be the intention of the directors to promote a Bill next session for compulsory running powers over the Corporation lines. Such a Bill was promoted a few years ago, but was withdrawn upon the Corporation agreeing to purchase the company's undertaking. A Bill to give effect to this latter proposal, however, was rejected on second reading in the House of Commons.

BRIGHTON: *Tramway Accounts.*—A net loss of £2,420 is shown in the accounts of the municipal tramways undertaking for the year to March 31st. The receipts amounted to £47,809 and the expenditure to £36,670. Capital charges, however, amounted to £13,559. The receipts show an increase of £608, but the working expenses, including renewals, show an increase of £2,111. The number of passengers carried during the year amounted to 10,034,965, against 9,945,574 in the previous year. The main increase in working expenses is in regard to permanent way, which shows an increase of about £1,500, which the Tramway Manager attributes to the maintenance of wood paving. In his report of the year, the Tramways Manager states that the excessive price paid for current is crippling the undertaking to such an extent that it will never be able to pay its way until a substantial reduction is obtained. The Manager also thinks that the whole cost of maintaining the wood paving on the tramway tracks should not be borne by the Tramways Department, as the cars were not responsible for any wear of the wood paving on any part of the road.

BURTON-ON-TRENT: *Electricity Accounts.*—The accounts of the Corporation electricity department for the year ended March 31st show a surplus of £836 after meeting capital expenditure, against £1,104 for the previous year. The sum of £31 capital expenditure is to be met and the balance carried to renewals fund. The number of units sold increased by only 9 per cent. compared with 20 per cent. in the two preceding years. The gross profit amounted to £5,866, against £6,105 in 1907-8. The report points out that six years ago the revenue was more than it is to-day, notwithstanding that the lamp connections during this period have increased by 43 per cent. The causes are said to be: (1) Economy generally exercised by old consumers; (2) the concessions in price that have been granted; and (3) the introduction of the high efficiency metallic lamp. Thirteen motors had been added during the year, and the number of units sold for power purposes increased from 401,690 to 533,390. Every item of expenditure, with the exception of repairs and maintenance, has been reduced, the works costs being 1·823d.

BURY: *Tramway Profits.*—The net profits from the Corporation tramways for the year to March 31st amounted to £3,272, which is slightly less than in the previous year. It is proposed to carry £2,500 to reserve, and to transfer the balance to the relief of rates. About 11,500,000 passengers were carried, an increase of about 500,000 over the previous year, the total receipts being £59,000.

Electricity Profits.—The electricity undertaking shows a net profit of £2,914 against £4,026 in 1907-8, a decrease which is attributed mainly to reductions in price.

CLACTON: *Electricity Works Loss.*—A loss of £940 is shown by the accounts of the municipal electricity department for the year to March 31st.

DARLINGTON: *Tramway Losses.*—The total receipts from the municipal tramways during the year to March 31st amounted to £10,540, but after meeting expenditure and capital charges there is a loss of £1,343.

DUBLIN: *Workhouse Lighting.*—With reference to the recent decision of the South Dublin Union Board of Guardians to adopt electric lighting, a member of the Board moved a resolution at the last meeting recommending that an independent electrical engineer should be retained to report fully on the relative cost and advantages of electricity and gas, owing to the differences of opinion among the members of the Board on the matter. The chairman, however, ruled the motion out of order.

EAST GRINSTEAD: *Proposed Electricity Supply.*—The Sussex Electricity Co. have asked if the Council will support a proposal to install an electricity works in the district. The matter has been referred to the Finance Committee.

EDINBURGH: *Electric Supply Revenue.*—In presenting the

Digitized by Google

estimates for the ensuing year last week, Treasurer Harrison, referring to the electricity undertaking, said that the Electric Lighting Committee proposed last September a reduction in the price of current for private lighting from 3d. to 2⅞d. He opposed the reduction, but it was carried against him. The estimates now presented by the Electric Lighting Committee amply and fully justified his opposition. He feared a decline in the income derived from private lighting, not on account of any falling off in popularity, but because of the economy of the new metallic-filament lamps. That had evidently happened, for an estimate had been made for a reduction of sale of current to the extent of £3,600. Nor was that all; to earn this smaller turnover the committee proposed to spend £13,100 for the extension of mains. In strict finance this sum of £13,100 would be altogether unremunerative, and yet it was being put to capital.

FROME: *Electric Supply Undertaking.*—Messrs. Edmundson's Electricity Corporation, who at present are working the electricity works in Frome under a lease from the Council, have sent in a draft agreement setting forth the terms upon which they will consent to a transfer of the undertaking to the Council.

GLASTONBURY: *Provisional Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Corporation in 1904.

HULL: *Supply to Guardians.*—Mr. H. Bell, the City Electrical Engineer, has informed the Guardians that the electricity department is prepared to supply a restricted quantity of electricity for lighting purposes during the night-time at one penny per unit. The Guardians are considering a rearrangement of their present electrical plant, and contemplate taking a supply from the Corporation at night.

LONDON: *London County Council: Tramway Employees.*—In a lengthy report the Highways Committee deal with the conditions under which the tramway employees are now working, and with the grievances which have recently been discussed on behalf of the men by the Amalgamated Association of Tramway & Vehicle Workers. These principally relate to (*a*) spread-over time, (*b*) payment in respect of the time occupied by the men in paying in their daily receipts, and the time occupied in getting the cars in and out of the depôts, (*c*) Sunday labour, and (*d*) holidays. The Highways Committee recommend that they be authorised, after conference with the Board of Trade, to submit to the Council details of a scheme for the establishment of conciliation boards for the Council's tramways on the lines of those agreed to in the case of railway companies. The recommendation was adopted at Tuesday's meeting.

Stepney: The Trolley System.—Although, as reported in our last issue, the Works Committee of the Borough Council recommended that the request of the London County Council to install the overhead trolley system of traction over a portion of the Aldgate to Bow route be refused, the Council has decided to meet the County Council and allow the overhead system between Burdett Road and Coburn Road. The reconstruction of the route on the conduit and overhead system has already been commenced.

MIDDLESBROUGH: *The Electricity Undertaking.*—The gross profit on the electricity undertaking for the year to March 31st amounted to £7,597, or 6·9 per cent. on the capital expenditure, as against £6,058, or 5·8 per cent., the previous year. The Corporation, it will be remembered, purchases some energy from the County of Durham Electric Power Supply Co. The net financial result was a profit of £852, against a deficit last year. At the Corporation works, however, 30 per cent. of the total units sold were generated, the works' cost being £6,437, or 0·93d. per unit, against £7,735, or 1·18d. per unit, in the previous year. The total costs were £8,718, against £10,035, or 1·26d., against 1·53d. per unit. The total revenue was £16,315, against £16,092; gross profit, £7,597, against £6,057, and the interest and redemption £6,745, against £6,150, leaving a net profit of £852, against a deficit of £93 the previous year. The units sold totalled 1,661,000, against 1,572,000, and the number taken from the Power Company was 1,338,000. All the sums taken from the rates in previous years have now been repaid.

NEWCASTLE-UNDER-LYME: *Tramway Track.*—Negotiations are being carried on with the Potteries Electric Traction Co. with a view to converting some portions of the existing single track to double track.

PENMAENMAWR: *Electric Supply.*—Negotiations are being carried on between the Council and the North Wales Electric Power Co. with regard to a supply of electricity in bulk by the company.

ROTHERHAM: *Electricity Accounts.*—The income from the electricity department during the year ended March 31st was £13,750, as compared with £13,108 for the previous year. The gross profit amounts to £7,021, as against £7,214. After debiting all loan charges there remains a sum of £3,098, compared with £3,301 for the previous twelve months.

SOUTH SHIELDS: *The Tunnel under the Tyne.*—Once again the Corporation have refused to be partly responsible for the debenture interest in connection with the proposed company for constructing an electric tube railway under the Tyne between North and South Shields. It will be remembered that the three Corporations interested, viz., North Shields, South Shields, and Tynemouth, a short time ago rejected the proposal that they should guarantee the whole of the interest on £100,000 four per cent. debentures. Since then a new suggestion has been put forward, in the shape of asking the respective Councils to guarantee half this interest if the North-Eastern Railway Co. will provide the remaining half. It is this which the South Shields Corporation have just voted against.

STOKE-ON-TRENT: *Electricity Accounts.*—During the year to March 31st 693,367 units were sold, this output being nearly double that of the previous year. The revenue was £4,927, compared with £3,925, and expenditure amounted to £2,826, compared with £2,003, leaving a gross profit of £2,100, compared with £1,921 in the previous year. After meeting capital charges there was a net profit of £140, compared with £157 in the previous year. The average price received was 1·70d. per unit. In the previous year this was 2·51d. per unit, and it is pointed out that compared with the other electrical undertakings in the Potteries district, it is considerably the lowest. The works cost amounted to 0·98 of a penny per unit, as compared with 1·28 pence per unit in the previous year.

SUNDERLAND: *Tramway Extension.*—The residents of the Tunstall Road district are petitioning the Corporation to extend the tramways out there.

SUTTON COLDFIELD: *Electricity Accounts.*—For the year ended March 31st, the gross profit upon the electricity undertaking was £3,033, compared with £2,691 in the previous year. After meeting capital charges there is a net profit of £201.

WALMER: *Provisional Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1904.

WEST HARTLEPOOL: *Electricity Profits.*—For the year ended March 31st, the accounts of the electricity undertaking show a profit of £584 after meeting capital charges. This sum has been carried to the reserve fund.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BRITISH COLONIES.—The Glasgow Chamber of Commerce has particulars of an opening in a British Colony for an electric lighting installation, and also, elsewhere, for the supply of elevators and heating apparatus.

CLEETHORPES.—A Local Government Board inquiry was held on Tuesday into an application by the Council for sanction to borrow £4,000 for electrical purposes.

FARNWORTH.—The Council invite tenders for the supply and laying in position, &c., of extra high- and low-tension cables in connection with the extensions at their electricity works. Also for the supply and fixing into position of 10 circuit-breakers in connection with the additions to the switchboard. Particulars from Mr. R. B. Leach, electrical engineer, and tenders by May 24th.

FINLAND.—The Senate have voted the sum of 130,000 marks for new electrical works at Ekenas.

HOLLAND.—An electricity works is to be erected by the Delft Municipality.

LEEK.—Additional mains are to be laid at an estimated cost of £185.

LIVERPOOL.—The Local Government Board has sanctioned the borrowing of £58,000 to provide additional generating plant at Lister Drive No. 2 Electric Power Station, and the Tramways Committee now ask to be allowed to borrow £10,000 for prospective expenditure on sub-station equipment.

LLANDUDNO.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £2,450 for providing additional generating machinery in connection with the supply to the tramway company. There was no opposition.

LONGTON.—A 300-kw. generating set is to be installed, as well as additions to the switchboard, at an estimated cost of £2,580. An application is to be made to the Local Government Board for sanction to borrow this sum.

NOTTINGHAM.—Tenders are invited by May 20th for the supply of coal to the Talbot Street and St. Ann's Well Road generating stations of the Corporation during the twelve months commencing June 1st next. Specification from the Electrical Engineer.

PLYMOUTH.—A new 350-kw. turbo-generating set, together with the necessary foundations, pipework, and auxiliaries, at an estimated cost of £2,500, is to be installed.

SHEFFIELD.—The Electric Light Committee, having almost exhausted their borrowing powers for feeders and general mains and services, propose to apply for sanction to borrow £50,000 for the purpose of laying mains, feeders, and for general main extensions and sub-stations, and £6,000 for services.

Digitized by Google

VLADIVOSTOK.—It is announced that the municipal Council have under consideration a large scheme of public improvements, including the installation of electric lighting and tramways.

WEST HAM.—In order to improve the traction supply in the Stratford district it has been decided to lay a 0·15 6,000-volt two-phase twin concentric cable from the generating station to the Town Hall, installing rotary converters and transformers and the necessary switchgear, at a total estimated cost of £6,253.

WIMBLEDON.—Application is to be made to the Local Government Board for sanction to borrow £5,000, being the estimated amount of capital expenditure upon mains and house services during the year ending March 31st, 1910, and £800, being the estimated amount to capital expenditure upon meters for the same period.

Miscellaneous

HOLLAND.—The Government propose to construct an electric tramway from Lichtenvoorde to Bocholt.

LONDON: *London County Council.*—The Council invite tenders for the supply and delivery of 200 double-deck, roof-covered car bodies, 200 car sets of maximum traction, swing bolster trucks, and 200 complete electrical equipments for operation upon both the conduit and overhead systems. Full particulars from the Chief Officer of Tramways, fee £2 each specification, or £5 for the three, and tenders to the Clerk by June 15th.

NOTTINGHAM.—Tramways extensions are to be carried out involving the provision of ten new tramcars.

SOUTH AFRICA.—*The British and South African Export Gazette* understands the Agent-General for the Transvaal in London will shortly call for tenders for a 3-ton electrical furnace capable of turning out 6 tons of steel per diem. It will be erected at the iron smelting works which the Government are about to establish at Pretoria.

Contracts for the supply of a number of electricity meters may be looked for shortly from the Johannesburg Corporation.

A complete electric lighting plant is required by the Oudtshoorn Electric Lighting Co. Apply to the Secretary.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON: E.—Improvements at Marner Street School (£14,893), Bow and Bromley. Builders, Holliday & Greenwood, Ltd., Loughborough Park Works, Brixton, S.W.

N.—Manual training centres, also elementary school (623 places), on the Hoxton House site, Hoxton. T. J. Bailey, architect, L.C.C. Education Committee, Victoria Embankment, E.C.

N.E.—Higher dual school (£18,140), Hackney. Builders, Galbraith Bros., 46 Camberwell Green, S.E.

W.—Enlargement of Amberley Road School by 644 places, Paddington. T. J. Bailey, architect, L.C.C. Education Committee, Victoria Embankment, E.C.

PROVINCES.

ABERGAVENNY.—Additions and alterations to Monmouthshire Asylum (£13,739). Architect, E. A. Johnson, St. Mary's Chambers, Monk Street, Abergavenny.

BELFAST.—Factory for Gallagher, Ltd. Architect, S. Stevenson, Royal Avenue, Belfast.

Factory and warehouses. Architects, Hobart & Heron, Scottish Provident Buildings, Belfast.

Factory for Northern Spinning Co. Architect, S. Stevenson, Royal Avenue, Belfast.

BURSLEM.—Sunday school (£2,000). Architects, W. Grant & Son, Burslem.

CROYDON.—Skating rink, Cherry Orchard Road, Brickwood Estate. Architects, Berney & Son, 104 George Street, Croydon.

FORT WILLIAM (N.B.).—Residence (£2,000). Architect, R. J. Lowe, 104 Commercial Street, Dundee.

JARROW.—Swimming baths (£6,000). Architect, J. H. Morton, 50 King Street, South Shields.

LEICESTER.—Swimming baths. Architect, A. Hind, 3 Greyfriars, Leicester.

NEWCASTLE.—Block business premises. Architect, F. E. Datchin, 6 Weshgate Road, Newcastle.

PLYMOUTH.—Improvements at the public school (£2,000). Architects, Hine, Odgers & May, 23 Lockyer Street, Plymouth.

WEST HARTLEPOOL.—Empire Theatre (£12,746). Architects, W. & T. R. Milburn, 20 Fawcett Street, Sunderland; builders, J. Howe & Co., West Hartlepool.

Tramway Strike in Cork.—The strike still continues, and traffic is suspended. A conference between the directors and strikers was held, but came to nothing, as although many demands were conceded, the directors would not consent to the reinstatement of the discharged men.

TENDERS RECEIVED AND ACCEPTED

BURY.—An order for two 500-kw. generating sets has been placed with the General Electric Co., Ltd.

BUXTON.—The tender of Messrs. James Light & Sons for the supply of engine oil to the electricity works has been accepted.

CUPAR (N.B.).—The tender of Messrs. W. Barton & Sons, of Edinburgh, has been accepted for the wiring of the Town Hall.

DARLINGTON.—The Brush Electrical Engineering Co., Ltd., who submitted the lowest tender for a 500-kw. exhaust steam turbo-generator, viz., £2,000, has informed the Council that they will be unable to complete the work in the stipulated time owing to press of other orders. The tender of Messrs. Belliss & Morcom at £2,660 has been accepted, although the Electrical Engineer recommended the acceptance of the tender of the British Westinghouse Co.

EDINBURGH.—The tender of the Lahmeyer Electrical Co., Ltd., has been accepted for the supply of cable at £6,544. It was stated at the meeting of the Corporation last week that the lowest British tender was £7,437, but that on this being allowed to be revised it was £6,905. The Chairman of the Electric Lighting Committee, whilst realising that it was a case of severe competition, said there was no reason why the Corporation should not take advantage of this. The Lahmeyer Co. had been contractors here for many years, and had always given satisfaction.

ERITH.—The tender of Messrs. G. H. Gunning & Sons has been accepted for the supply and fixing of ventilating apparatus in the engine-room at the electricity works at £43 15s.

FAREHAM.—The Council have accepted the following tenders:—Mains, British Insulated & Helsby Cables, Ltd., £238; transformers, Spagnoletti, Ltd., £172; lamp pillars, brackets, and fittings, W. Lucy & Co., Ltd., £24 14s. 8d.

LONDON: *London County Council.*—The following tenders have been received for the execution of the roadwork and plate-laying, exclusive of the supply of rails and special track work, in connection with the construction on the underground conduit system, of the authorised tramways from "The Plough," Clapham, *via* Long Road and Clapham Common, North Side, to a point in Cedars Road, near Lavender Hill, and (2) the single lines from Lewisham High Road, *via* Malpas Road and Shardeloes Road to Brockley Road, which form part of the authorised Lewisham High Road to Forest Hill tramways:—Dick, Kerr & Co., £28,708; A. M. Coles, £29,361; W. Manders, £29,619; J. Mowlem & Co., (say) £30,274; Fry Brothers, £31,205; R. C. Brebner, £33,668; H. M. Nowell, £43,616. The tender of Messrs. Dick, Kerr & Co. is recommended for acceptance.

London County Council.—The following tenders have been received for the supply and delivery of (1) 4,000 tons of track rails and fastenings; (2) 3,000 tons of slot rails and conductor tees:—Track rails and fastenings: Stahlwerks-Verband, Düsseldorf (manufactured by Phœnix Steel Co., Ruhrort) (rails quoted f.o.b. at Antwerp instead of on basis of delivery in London) (incomplete tender), £21,057 5s.; Société Anonyme d'Ougrée Marihaye, Belgium, £22,511 16s. 2d.; Société Anonyme des Aciéries d'Angleur, Belgium, £22,656 14s.; Bolckow, Vaughan & Co. (recommended), £24,958 19s. 8d.; Lorain Steel Co., U.S.A., £26,062 19s.; P. & W. Maclellan, Ltd., Glasgow (manufactured by the North-Eastern Steel Co.), £26,465 1s.; Walter Scott, Ltd., £26,865 5s.; Barrow Hæmatite Steel Co., £27,399 6s. 6d. Slot rails and conductor tees: Frodingham Iron & Steel Co., Ltd., Frodingham (recommended), £21,197 15s.; Walter Scott, Ltd., £21,784; P. & W. Maclellan, Ltd., £22,012 10s.; Barrow Hæmatite Steel Co., £33,650; Société Anonyme des Aciéries d'Angleur, Belgium (incomplete tender, for slot rails only), £14,869.

The offer of W. T. Henley's Telegraph Works, Ltd., to extend the existing low-tension cables on the Aldgate to Bow tramway route in connection with the reconstruction of the line for the conduit and overhead systems, has been accepted. The estimated cost is £2,250.

The following tenders have been received for withdrawing and relaying low-tension cables in connection with the working of the Victoria Embankment tramways from the Elephant and Castle sub-station:—Robert W. Blackwell & Co. (accepted), £2,944 16s. 2d.; Western Electric Co., £3,147 17s. 4d.; Johnson & Phillips, £3,191 2s. 2d.; British Insulated & Helsby Cables, £3,198 17s. 6d.; W. T. Henley's Telegraph Works Co., £3,245 0s. 3d.; W. T. Glover & Co., £3,324 17s. 7d.; Callender's Cable & Construction Co., £3,435 16s. 6d.; Siemens Brothers & Co., £3,438 7s. 9d.

Battersea.—The Council has accepted the tender of Mackenzie & Moncur, Ltd., for the supply of six arc lamp columns of drawn steel at £12 15s. each.

Metropolitan Asylums Board.—The following tenders have been received for two large ambulance tramcars and two smaller ones:—The United Electric Car Co., Ltd. (accepted), £838; Dick, Kerr & Co., Ltd., £846 7s. 6d.; Gloucester Railway Carriage & Wagon Co., Ltd., £860; the Brush Electrical Engineering Co., Ltd., £875; Hurst, Nelson & Co., Ltd., £1,000; G. C. Milnes, Voss & Co., Ltd., £1,200; Mountain &

Digitized by Google

Gibson, Ltd., £1,930. The Engineer-in-Chief's estimate was £1,120.

SHIPLEY.—The tender of Mr. R. Lindley, Jun., of Shipley, has been accepted for the installation of electric lighting, bells, telephones, X-ray apparatus, and electric lift at the hospital of the Salt Charity Governors.

TONBRIDGE.—The following tenders for stores at the Electricity Works have been accepted: Carbons, W. Geipel & Co.; Meters, Chamberlain & Hookham; Cables, Western Electric Co.

COMPANIES' MEETINGS AND REPORTS

LOCH LEVEN WATER & ELECTRIC POWER CO.—At an extraordinary general meeting last week a resolution authorising the raising of mortgage debentures to the extent of £240,000 was passed.

CLYDE VALLEY ELECTRICAL POWER CO.—The report for the half-year to December 31st shows a net profit of £1,030. The contracts entered into for power supply during the half-year amounted to 24,381 h.p., an increase of 4,351 h.p. over the corresponding period of 1907. At the meeting last week, the report and accounts were adopted.

BRUSH ELECTRICAL ENGINEERING CO.—The report for 1908 states that an issue was made during the year of £100,000 (part of an authorised issue of £125,000) five per cent. prior lien debenture stock. The accounts show a gross profit of £28,213, and the amount carried to net profit and loss account is £2,614. Debenture and other interest charges absorb £17,798. To this amount the directors have thought it well to add a sum of £24,173 to meet bad and doubtful debts and depreciation of stocks. The directors propose to apply the sum of £10,229 standing to credit of general reserve account towards writing off the loss on the year's working, and to carry forward the debit balance of £29,128. The year under review has been one of exceptional trade depression, and the directors much regret that the company's operations have resulted in a loss. The aggregate of orders during the first part of the year was below the average, but it was expected that in accordance with previous experience the results for the latter part of the year would counteract this shortage. Unfortunately this was not realised, and the concluding months showed a further marked falling off in the volume of business. The working expenses and establishment charges have been substantially reduced and important economies have been realised, the full effect of which, however, does not appear in the accounts for 1908. The directors and management are continuing their efforts in this direction, and the general charges for the current year show a large diminution as compared with those for 1908. On the electrical engineering side the company's business has been adversely affected by the general adoption of metal filament lamps, the greater economy of which has temporarily checked orders for additional plant that in the normal course of events would have been required. Negotiations are in progress to acquire selling rights of a well-tried and highly successful metallic filament lamp. The demand for tramcars was small during the year, and there has been a noticeable lapse in the promotion of tramways and light railways in the United Kingdom. The reduced demand for the company's staple manufactures has led the directors to investigate other openings for activity in the industrial applications of electricity, and the company's experts are engaged on developments in special branches which hold out encouraging prospects. The business so far secured in the present year shows a marked advance in comparison with a similar period in 1908, and the directors hope that this improvement will be maintained. Mr. E. Garcke will assume the chairmanship of the company after the annual meeting, which is on the 18th inst.

WEST COAST OF AMERICA TELEGRAPH CO.—The accounts for 1908 show gross receipts amounting to £52,612, as against £61,854 in 1907. The working expenses were £33,193, as compared with £34,616. After providing for four per cent. debenture interest, and the interest on the four per cent. income bonds, there remains a balance of £12,087, to which is added the sum of £1,354 brought forward from 1907. Of this amount £8,000 has been placed to the general reserve fund, and £2,000 to the maintenance ship's reserve fund. The directors recommend a dividend of 2½ per cent., free of income tax, amounting of £2,813, leaving a balance of £629 to be carried forward. At the meeting on Tuesday, the report and accounts were adopted.

ORIENTAL TELEPHONE & ELECTRIC CO.—The report for the year 1908 states that, including £1,873 brought forward from 1907, and after deducting the interim dividends of 3 per cent., paid in November last on both the preference and ordinary shares, and making the necessary provision for redemption of the debenture stock of the company, and other charges, the amount to be dealt with is £18,728. The directors recommend a final dividend of 3 per cent. (less income tax) for the year on the preference shares; a final dividend of 5 per cent. (free of income tax) on the ordinary shares, making 8 per cent. for the year; to transfer to reserve account, £2,500; to reserve for contemplated pension scheme, £500; and to carry forward, £5,263. The Indian local companies have declared the same dividends as for the year 1907, viz., the Bengal Telephone Co., 5 per cent., and the Bombay Telephone Co., 6 per cent. The Telephone Co. of Egypt has declared a dividend of 10 per cent. for the year on both its preferred and deferred shares. The China & Japan Telephone & Electric Co. continues to make satisfactory progress, both at Hongkong and Kowloon, and the directors of that company consider the outlook favourable. At the meeting last week, the report and accounts were adopted.

COLOMBO ELECTRIC TRAMWAYS & LIGHTING CO.—The total net profits for 1908 amounted to £23,181. After transferring £7,000 to track renewal account, meeting debenture interest, and adding the sum brought forward from the previous year, there is a balance of £15,906. From this £7,136 has been transferred to general reserve and renewal fund, and a dividend of 5 per cent. is recommended on the ordinary shares, carrying forward £2,227.

CITY OF BIRMINGHAM TRAMWAYS CO.—The report for 1908 states that after providing for the year's interest on debentures and dividend on the preference shares and interim dividend on the ordinary shares, there is a balance of £34,873. A dividend is recommended on the ordinary shares at 5 per cent. per annum for the six months ended December 31st, together with a bonus of 5 per cent. (making 10 per cent. for the year), and the transfer of £28,559 to reserve fund, increasing that fund to £487,680 to provide for depreciation of assets, redemption of debentures, and for general purposes. The traffic receipts compared with the previous year show a reduction of £2,213, while the receipts from advertising and interest on investments show an increase of £1,158.

At the meeting on Thursday, the report and accounts were adopted. Mr. C. S. Hilton, who presided in the absence of the Chairman of the company, Mr. E. Garcke, stated that the result of the year's working must be regarded as satisfactory, as the amount carried to the balance-sheet, viz., £34,873, was an improvement of £1,200 compared with 1907. He regretted that an arrangement could not be come to for the lease of the Handsworth lines to the Council, but the latter had broken off negotiations, and the matter would now go to arbitration. When these lines had been paid for by the Council they would be leased to the company until 1911.

URBAN ELECTRIC SUPPLY CO.—At the annual meeting last week, the report and accounts given in our issue for April 29th were adopted. Mr. P. D. Tuckett, who presided, said that an actual increase in revenue of £4,543 at eight of the towns served by the company had been offset by a decrease of £2,161 at the remaining five.

AUCKLAND ELECTRIC TRAMWAYS CO.—The report for 1908 states that the total revenue amounted to £165,655. The traffic receipts, which amounted to £163,848, show an increase of £26,129, and after deducting all expenses, including £15,718 for debenture and other interest, &c., and setting aside £12,500, compared with £10,000 last year, to the depreciation account, there is a surplus of £32,755, to which has to be added £2,165 brought forward. The directors recommend the placing to reserve account of £10,000, and after meeting the preference dividend, a dividend of 6 per cent. per annum is recommended on the ordinary shares, carrying forward £3,920.

At the meeting last week, the report and accounts were adopted. The Chairman, Mr. C. G. Tegetmeier, stated that it had become necessary to install high-tension plant in order to transmit economically all over the system. Consequently, a 600-kw. 5,000-volt generating set was to be put in. In addition, a further boiler was to be installed, as well as up-to-date coal-handling plant. The funds to meet this expenditure would be provided by the recent issue of capital. During the past year a Commission appointed by the New Zealand Government held an inquiry on the subject of the brakes with which the company's cars were equipped, and as a result of the report of the Commission the Public Works Department had called for a new and more efficient brake system to be installed on all cars, and to the submission to the Department for approval of full details of the brake proposed. While the directors contended that the present brake system was efficient and well suited for the conditions of their traffic—a contention which their freedom from accidents attributable to brake failures went far to substantiate they were desirous of meeting the requirements of the Department in every possible and reasonable way.

NORTH OF SCOTLAND ELECTRIC LIGHT & POWER CO.—The accounts for 1908 state that the lamp connections in Montrose have increased from 19,308 to 20,296, 8 c.p. lamps equivalent; in Brechin from 16,399 to 17,071; and in Inverness from 14,655 to 18,106, making a total of 55,473. The gross profit for the year, after deduction of the debit balance of £98 brought forward, is £3,168, and after meeting interest on debentures and loans amounting to £1,601 and writing off for loss on free wiring and motors dismantled and depreciation of wiring stocks, &c., the sum of £640, there remains a net profit of £925. It is proposed to write off the preliminary expenses, amounting to £374, and to transfer £500 to the renewal and reserve account and £50 to the reserve for bad debts account and to carry forward a balance of £1 to the next account.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £60 5s. to £60 10s. (last week £58 12s. 6d. to £58 17s. 6d.).

AGENCY.—Messrs. T. Harding Churton & Co., of Leeds, have appointed Mr. David Alexander, M.I.E.E., of 43 Mains Street, Waterloo Street, Glasgow, as agent for Scotland for the sale of their alternating-current motors.

PIRELLI, LTD.—This firm is being registered as a limited company affiliated to the parent house, Pirelli & Co., of Milan. Pirelli & Co. is an Italian firm of high standing, manufacturing power cables, house wires, flexibles, &c., and also motor tyres and all things connected with the india-rubber and gutta-percha industry. Mr. H. Bevis will be Managing Director of the new company. The address of Pirelli, Ltd., is 45 Basinghall Street, London, E.C.

GRAL LAMPS.—The Armorduct Manufacturing Co., Ltd., of Farringdon Avenue, inform us that considerable reductions have been made in the price of these lamps, particularly in the case of the 50 and 100 c.p. lamps, and that the ordinary trade discount has been increased from 20 per cent. to 25 per cent., while the rebate scale for quantities has been maintained.

MISCELLANEOUS CITY NOTES

MELBOURNE ELECTRIC SUPPLY CO.—Subscriptions have been invited during the week to an issue of £100,000 five per cent. first mortgage stock at 93 per cent, and 20,000 seven per cent. first cumulative shares of £5 each at par.

NATIONAL TELEWRITER CO.—Subscriptions are invited until to-day (Thursday) for an issue at par of £180,000 preferred ordinary shares of £1 each. The company has been formed to acquire the Telewriter Syndicate, Ltd., which has been supplying "telewriter" instruments for some time past, and which are now installed in a considerable number of business establishments. It is now intended to install "telewriter" exchanges. A licence for 21 years has been granted by the Postmaster-General, and the rights conferred by this are as follows:—(1) To work exchanges for transmitting telewriter messages, including telephonic messages, in relation or supplementary thereto; (2) the transmission direct to post offices through such exchanges of ordinary telegrams and the benefit of other postal facilities; (3) the transmission in writing or drawing of Parliamentary, sporting, Stock Exchange, and general news; (4) the supply of telewriters to all private lines rented from the Post Office. The company will be relieved from any heavy capital expenditure, as the Postmaster-General undertakes to provide all wires and wayleaves, at usual rentals, and, further, an agreement has been entered into with the National Telephone Co., by which the Telewriter Co. will receive the benefit of the Telephone Co.'s existing canvassing organisation. A report by Messrs. Preece & Cardew accompanies the prospectus, in which a net return of 33 per cent. upon the capital outlay is anticipated. The present issue carries interest at 7 per cent., which is cumulative. The total capital of the company is £300,000 divided into 210,000 preferred ordinary shares and 90,000 deferred ordinary shares. Sir William Treloar, Bart., is Chairman of the company, and Sir Albert Rollit, who is a director of the National Telephone Co., Ltd., and Mr. E. B. Ellice-Clark, a director of the Edison & Swan United Electric Light Co., Ltd., are among the directors.

RIO DE JANEIRO TRAMWAY, LIGHT & POWER CO.—A new issue of 62,500 ordinary shares is being offered to the existing shareholders.

Fire at the Hart Accumulator Co.'s Works.—A fire broke out on Tuesday afternoon at the works of the Hart Accumulator Co., Ltd., at Stratford, and the reports in the daily Press state that damage to the extent of £10,000 was done. The company has written us, however, contradicting these reports. They inform us that the damage is not so extensive as has been stated, and that the fire was entirely confined to a portion of the works that was at the time unoccupied, so that deliveries will not be affected in the slightest degree.

Linking up London Electricity Undertakings.—At a recent conference of London Borough Councils owning electricity undertakings, the Associated Municipal Electrical Engineers of Greater London were asked to draw up a linking-up scheme. The Associated Engineers have now done this, and their report shows that they have made careful inquiries as to the capacity and type of plant at present in use at the electrical stations of the several Borough Councils, and more especially of what is known as spare or reserve plant. They have also collected a large amount of statistical data, and are in a position to submit an estimate of the cost of carrying out a scheme of linking up, but they desire that details shall not be published at present. The various Borough Councils owning electricity undertakings are adjourning the consideration of the report until a joint conference of representatives of Metropolitan Companies and Borough Councils has been held. Arrangements for this joint conference are now being made.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. B. Sunderland, of the audit office of the Great Southern & Western Railway Co., of Ireland, has been appointed audit accountant to the British Columbia Electric Railway Co., at Vancouver, at a salary of £400 per annum.

Mr. T. Roles, electrical engineer to the Bradford Corporation, has been presented with a dining-room clock by the electricity department, on the occasion of his recent marriage. The presentation was made at a special meeting of the Electricity Committee.

Mr. F. H. Edwards, Woolwich, has been appointed deputy electrical engineer to the Erith Urban District Council at a salary of £180 per annum.

The Southwark Borough Council has received 119 applications for the post of borough electrical engineer, rendered vacant by the resignation of Mr. D. M. Kinghorn. A final selection will not be made, however, until the special committee, which was appointed to investigate the working of the electrical undertaking, has reported.

The West Ham Electricity Committee have decided, subject to the consent of the Marylebone Council being obtained, that the services of Mr. A. H. Seabrook be retained as consulting electrical engineer at a fee of 100gs. for a period of one year, or such time as may be necessary to dispose finally of several matters which will need his attention. Steps are being taken to fill the vacancy caused by Mr. Seabrook's appointment to Marylebone.

Mr. H. Bevis, after a connection of over twenty years with the General Electric Co., Ltd., has resigned his directorship, and is taking up the position of Managing Director of Pirelli, Ltd., particulars of which firm will be found in a Business Note on this page. Mr. Bevis asks us to state that he will at all times be pleased to see any of his old friends at his new address, 45 Basinghall Street, London, E.C.

NEW PUBLICATIONS

"Telegraphists' and Telephonists' Note-Book." (London: S. Rentell & Co., Ltd.) 1s. 6d. net.

"The G.E.R. Tourist Guide to the Continent." By Percy Lindley. (London: The Author, 30 Fleet Street, E.C.) 6d. net.

Amalgamated Radio-Telegraph Co.—In connection with the liquidation of this company, an offer was made by two gentlemen named Lees and Earl to purchase the assets for £26,500, and subsequently a Mr. Hage offered £33,000, which was provisionally accepted by the Registrar. Later on Messrs. Lees and Earl increased their offer to £35,000, and the liquidators were desirous of selling at this higher figure. Mr. Hage, however, contended that the provisional acceptance of his offer constituted a contract. The matter came before Mr. Justice Neville, and after hearing arguments his lordship decided that, having allowed the parties to bid one against the other, and provisionally accepting the offer of Mr. Hage for £33,000, the Registrar could not accept a later offer, even though it be at a higher figure. An appeal against this decision came before the Master of the Rolls and Lords Justices Buckley and Kennedy on Saturday last, and after argument Mr. Justice Neville's decision was confirmed.

Smoke Nuisance in London.—With reference to the proposal of the Public Control Committee of the London County Council recommending that legislation should be promoted in the session of 1910 relative to the prevention of nuisance from smoke in the county of London, the Finance Committee of the County Council have reported against this proposition. The Finance Committee point out that they have no objection to the proposals of the Public Control Committee so far as they relate to strengthening the powers of the Borough Council in this matter, but they view with apprehension any proposal which might involve the County Council in increased expenditure of an uncertain amount in connection with the administration of any new powers which might be conferred as the result of the proposed legislation. In the absence, therefore, of any estimate as to the expenditure to which the Council might be put, the Finance Committee are unable to endorse the proposals of the Public Control Committee.

Telegraph Traffic and Movements of Cable Ships.—The submarine cable between Jamaica and Colon, owned by the West India and Panama Telegraph Co., Ltd., is now being repaired by the cable steamer *Henry Holmes*. This interruption, which took place on the 6th inst., does not, however, affect telegraphic communication, as the Isthmus of Panama can be reached over two other routes. The El Arich route was restored to working order on the 5th inst., only to be interrupted again on the same day at a point between Gaza and El Arich. Several towns in Algeria have recently been connected to the telegraphic system. The land line between Bagdad and Bassorah was down on the 10th inst.

THE MOTOR CONVERTER

A PAPER on the theory and application of motor converters was read on Thursday last before the Institution of Electrical Engineers by Mr. H. S. Hallo, of Bruce Peebles & Co., Ltd., Edinburgh. After dealing generally with the relative advantages and disadvantages of the rotary converter and the motor-generator, and pointing out in particular the difficulty of designing the former machines for 50-period circuits, the author concludes that it is small wonder that the motor-generator, especially for 50-period circuits, has held the field in spite of its low efficiency and high first cost. With the motor converter, however, he says, it is claimed that the good points of both the above machines are combined, whilst their defects are avoided. It is self-starting, yet runs synchronously when up to speed; its voltage may be regulated by adjusting the shunt resistance; it can be arranged as a three-wire generator; there

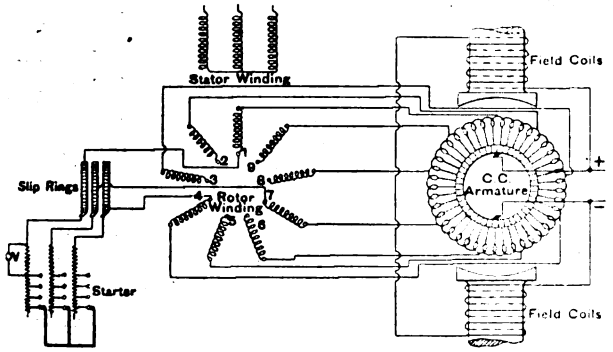

FIG. 1.—DIAGRAM OF CONNECTIONS OF MOTOR CONVERTER.

is no possibility of reversal of polarity; the efficiency is higher than that of a motor-generator of the same output, and is nearly equal to that of a rotary with its transformers; it is reversible; the first cost is less than that of a motor-generator, and when a large voltage variation is required, is cheaper even than the rotary. Furthermore, the motor converter takes up less floor space.

The motor converter consists of an ordinary induction motor with wound rotor and a continuous-current machine, coupled mechanically and electrically, and arranged with either two or three bearings. Fig. 1 shows the diagram of connections of a motor converter in its simplest form. The stator winding is shown as a star-connected three-phase winding, but the winding may also be mesh connected, or wound for any desired number of phases. The currents in this stator winding set up a rotating magnetic field, revolving with a speed depending upon the number of poles for which the stator is wound. This rotating field induces E.M.F.'s in the rotor windings, which are connected to corresponding points of the direct-wound armature. The rotor winding in Fig. 1 is shown with nine phases, although the majority of converters have been built with twelve phases. Three of the phases are connected to a suitable three-phase starter through slip rings. The excitation of the field coils is effected in the same way as with an ordinary direct-current generator. For the sake of simplicity it may now be assumed that the two machines have the same number of poles, in which case rotor and armature run at a speed corresponding to half the frequency of the primary circuit. In other words, the rotor is running with 50 per cent. slip, and the rotating field set up by the primary currents induces in the rotor windings a series of E.M.F.'s, which have half the frequency of the primary circuit. Since the d.c. armature is rotating at a speed corresponding to half the frequency of the supply circuit, the E.M.F.'s induced in its windings have also half the frequency of the primary circuit, and it is possible to connect the rotor and armature windings together—provided they are wound so that their E.M.F.'s are equal and in phase. The speed remains constant and the two machines connected in tandem behave as a single synchronous machine. The rotating field set up by the rotor currents, flowing through the armature, revolves in the opposite direction to the shaft, and is motionless as long as the speed keeps constant. It is the action between this field and the one set up by the magnet winding which keeps the machine in synchronism, in exactly the same manner as in an ordinary synchronous motor. Half the electrical energy supplied to the stator is converted into mechanical energy and transmitted by means of the shaft to the direct-current machine, whilst the other half of the energy supplied is transferred through the rotor winding to the armature winding in the form of electrical energy. Thus the induction motor operates half as motor and half as transformer, whilst the continuous-current machine operates half as ordinary dynamo and half as rotary converter. As the rating of the induction motor depends on the speed of the rotating field and not on that of the rotor, the motor is theoretically half as large as though with the given number of revolutions it had to convert the *whole* of the energy led in into mechanical energy. The converter runs at a speed corresponding to half the primary frequency, which is more advantageous with regard to commutation; consequently it is made of smaller proportions than an ordinary continuous-current generator or converter for the same output and primary frequency. When the numbers of poles are different the converter set will not run at a speed corresponding to half the frequency of the supply circuit, but the speed will be inversely proportional to the *sum* of the number of poles of both machines.

In starting a motor converter from the a.c. side, the high- or low-tension current is supplied direct to the stator winding, and induces currents in the phase windings of the rotor. At first only three of the nine or twelve phase-windings on the rotor are utilised. These are connected, as shown in Fig. 1, through slip rings and an external resistance to a neutral point. The external resistance is non-inductive, and is gradually cut out as the speed of the machine increases. The direct-current side, of course, is disconnected from the busbars and arranged for self-excitation, and the machine starts up as an ordinary induction motor. Meantime, the continuous-current end is building up its field. When the machine approaches synchronous speed, the E.M.F.'s induced in rotor and armature will alternately be in opposition and conjunction, and consequently the current flowing in the starter will alternately be small and large, causing the needle of the voltmeter, which is connected across the starter resistance, to swing slowly over the scale. The periodicity of the oscillations of this needle will gradually decrease until at last it will remain at rest. The starter can now be short-circuited, and afterwards the short-circuiter pushed home. This last operation connects up all the windings of the rotor.

In practice it is found necessary to insert resistance in the shunt circuit in order to bring the machine up to speed without taking excessive currents from the supply mains, and for this reason a fixed proportion of the resistance of the shunt regulator is kept in circuit during the operation of synchronising. It is also found advisable to adjust the starter and shunt resistance so that the machine first runs slightly over synchronous speed, to come down later automatically owing to the stronger excitation at the higher speed. It is possible to adjust starter and shunt resistance so that no regulation whatever is required during the starting period, the attendant simply waiting for the moment to short-circuit the starter and put in the short-circuiter, the converter coming into synchronism automatically, according to its size, within 1 to 1½ minutes after the current is switched on. The starting current is usually about 30 per cent. of the full-load current. In the case of a single-phase converter it is, of course, necessary to put an auxiliary winding on the stator to produce a starting torque. Naturally, the motor converter can also be started up from the direct-current side, in which case an ordinary direct-current starter and standard synchronising gear

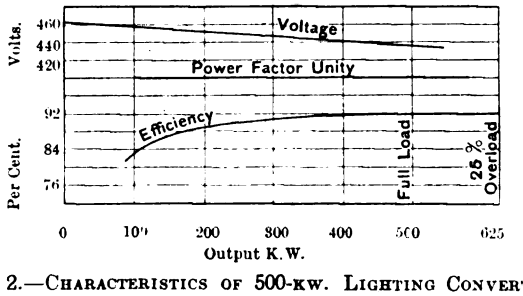

FIG. 2.—CHARACTERISTICS OF 500-KW. LIGHTING CONVERTER.

for the high-tension side are required. In this case slip rings and short-circuiter can be omitted altogether, and the rotor can be wound in mesh.

When motor converters are used for lighting, continued the author, they may be shunt or compound wound. Shunt machines have about 5 per cent. drop from no load to full load, and approximately unity power factor at all loads, as shown in Fig. 2. The efficiency, especially at low loads, is remarkably high (in this case almost 86 per cent. at quarter load), and the characteristic curves of the same machine shown in Fig. 3, show

Digitized by Google

that the power factor is well maintained within a wide range of regulation. Sometimes a large drop in voltage from no load to full load is desirable, as, for instance, when a battery is in use floating on the busbars. It is possible to design a motor converter for a large inherent voltage drop, but there are also other means of accomplishing this. The machine may be provided with a reversed compound winding, or in the case of commutating pole machines the commutating poles are not placed midway between the main poles, but slightly forward, thus

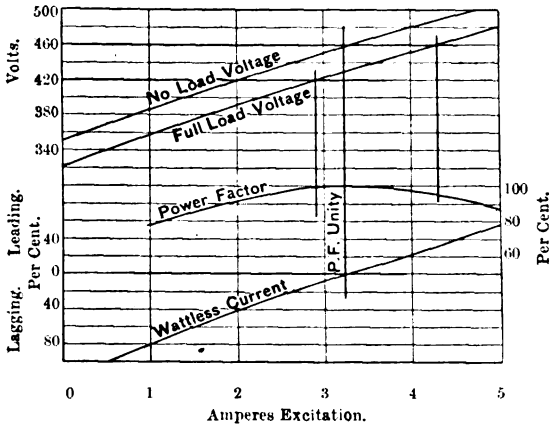

Fig. 3.—Regulation Characteristics of 500-kw. Lighting Converter.

artificially creating armature reaction, without interfering in the least with the commutation. Motor converters for traction service should automatically compound from 500 to 550 volts. The characteristics of a 500-kw. traction converter are shown in Fig. 4; the power factor is unity at about three-quarter load, and the wattless current here changes from lagging to leading, which has a favourable effect on the voltage regulation of the alternators. This feature is of special value where the central station supplies both traction and lighting systems. The machines can be fitted with commutating poles, so that they can withstand severe momentary overloads without sparking, and the freedom from liability to reversal of polarity on short-circuit is of great advantage in traction installations. Sometimes it is required that a motor converter shall be capable of supplying either a traction system at 500 to 550 volts, or a lighting system at, say, 420 to 460 volts. It is possible to build converters for this extreme range, and several machines with a voltage regulation of as much as 30 per cent. are in successful operation. In order, however, to improve the power factor in such a case, it is advisable to use a synchronous booster in series with the rotor winding. With this arrangement unity power factor is

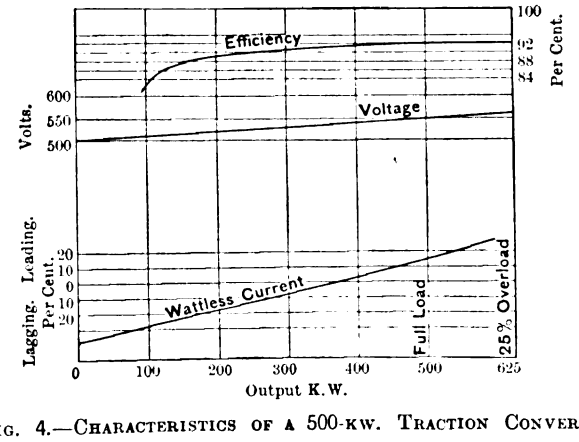

Fig. 4.—Characteristics of a 500-kw. Traction Converter.

obtained at all voltages, and the efficiency at the higher voltage is improved, the main machine acting more as converter and less as generator than would otherwise be the case.

Motor converters, continued the author, can also be used inverted. The increase of speed on inductive load is comparatively small, and does not necessitate the use of special exciters, as is the case with rotaries. The inherent regulation is excellent, the usual drop of the alternating-current voltage being 3 to 5 per cent. with unity power factor, and 12 to 15 per cent. with power factor 0·8. If voltage regulation on the alternating-current side is required, it is necessary to use the synchronous booster unless the converter always runs in parallel with one or more synchronous machines, which can supply the wattless currents. The motor converter can further be used for three-wire supply, in which case the outer mains are connected as usual to the positive and negative terminals, whilst the middle wire is connected to the star-point of the rotor windings. A motor converter, thus connected up, automatically balances the current, and the voltage difference between the two halves usually does not exceed 1 per cent. of the voltage between the outers, with an out-of-balance current of as much as 50 per cent. of the full-load current. With 20 per cent. out-of-balance current the voltage difference would be well under ½ per cent. If, however, it should be necessary to keep the voltage of the two sides of the system absolutely equal, or even raise the voltage of the heavier loaded half to compensate for the extra drop on that side in feeders and distributing cables, a booster must be put in circuit. Such a booster is series wound, and can be driven by the extended converter-shaft.

All commutating-pole windings are generally fixed in either the positive or negative main. If out-of-balance currents are taken from the machine, however, the excitation of the commutating poles will not correspond to the total load on the machine, as the proper excitation is obtained when the current through the commutating-pole windings is an average between the currents in the two outers. Such excitation can be obtained by dividing up the commutating-pole circuit and by fixing the windings alternately in the positive and negative mains, but this necessitates the use of the full number of commutating poles. It is, however, possible to use only half the number of commutating poles by fixing additional windings on the poles. These additional windings must have half as many turns as the main windings, and the current of the middle wire must pass through them.

In conclusion, the author showed a few photographs of converters running in various sub-stations in this country. One of these was of the two-bearing type, the armature and rotor being built on a combined spider, so that the rotating part is very stiff, notwithstanding the long bearing span. It converts 6,500 volts alternating current of 50 cycles into direct current at 420 to 550 volts. A photograph of the largest motor converter yet built, a 1,500-kw. machine of the three-bearing type, was also shown.

DISCUSSION.

Dr. E. Rosenberg (British Westinghouse Co.) remarked that the author condemned the rotary converter, although one-half of the motor converter was a rotary converter. This half of the motor converter was bigger than a rotary converter of the same output and for half the frequency. The advantage of the half-frequency was doubtful, as nowadays turbo-generators were built with four poles to run at 2,500 r.p.m.; this corresponded to a frequency of 80 or 90 or even 100, and therefore a direct-current machine corresponding to a frequency of 50 was by no means a dangerous thing. In the Great Western Railway sub-station they had a motor converter of 500 kw. with six poles on the converter part. On the other hand there were rotary converters for 550 kw. for the same voltage with eight poles, running at 750 revs. per minute, and these were much smaller than the converter part of the former machine. The motor of a motor converter was designed for the full load, and there were, in addition, iron losses which did not occur in a rotary converter. The only thing that was saved as compared with a rotary converter were the windage and friction losses due to the higher speed. In the early part of the Paper the author complained that it was necessary to have a booster with a rotary converter, and yet later on he stated that with motor converters which had to work on lighting and traction loads it was necessary to use a booster. Rotary converters were working with a range of 420–460 volts for lighting and 550 volts for traction, without a booster, for it was quite easy to provide two tappings on the transformer, one for 440 volts and one for 550 volts, and to regulate up or down 5 per cent. by means of the shunt regulator alone, if the transformer was provided with reaction.

Mr. B. M. Jenkin (Messrs. Kennedy and Jenkin) said that the Great Western Railway Co. had received a tender for these machines in connection with the electric working of the Hammersmith-City line, and after making exhaustive tests on a small experimental machine at Messrs. Bruce Peebles' works, it was decided to try them, although at that time they were untried in practice. However, they had been extremely pleased with the result, and had never regretted in the least having adopted them. They suited the conditions particularly well, as their chief duty was to supply power for the railway. In addition, however, the lighting of Paddington station had to be dealt with, as well as that of the hotel and goods sheds. They had put in batteries of sufficient size to maintain the railway supply for a short time, and the supply for lighting for a very long time, should there be an interruption at the power station

Digitized by Google

at Park Royal. The system of lighting at Paddington was alternating current distributed at 6,000 volts to static transformers, and so they were obliged to put in reversible motor-generators, so as to be able to supply a.c. current from the batteries. They had originally specified synchronous machines, but the motor converters were adopted, as, besides working better, they occupied less space than ordinary motor-generators, could be started up from the a.c. as well as from the d.c. side, were as reversible as the synchronous machines, gave unity power factor, and also, what was of great importance, gave a high efficiency at full load and a very high efficiency at low loads. Thus, when dealing with a widely fluctuating railway load, a higher overall efficiency at the sub-station was obtained. With the experimental machine he got an efficiency of 90·5 per cent. at full load. With regard to reversibility, on one occasion he was running two of the machines on the Hopkinson test, and one of the machines was loaded on the a.c. side to 30 per cent. overload as a generator. Without touching anything except the regulator, the power was reversed so that the machine was run as a motor with 77 per cent. overload. This really meant 100 per cent. overload in amperes, through the d.c. armature, and it did this without sparking. The author had mentioned that when the d.c. field was broken, the machine ran up to true synchronism as an induction motor, which was approximately double speed. He wanted to see if things were safe, so he broke the field and the machine ran up to synchronism, but everything was all right. In starting from the a.c. side one must be careful that the d.c. field builds up as it gains speed. Should it not do so, the machine would run above the right speed, which would necessitate shutting down and beginning all over again. It was also necessary to remember that with a fixed load on the machines the d.c. voltage varied as the a.c. voltage varied. In starting from the d.c. side, the a.c. voltage was best regulated for synchronising by varying the d.c. bus-bar voltage with the aid of a battery booster; this was simpler than having series boosters on the machines themselves. One of the tests they had made at their station was to run for 48 hours, taking measurements at the power station and sub-stations throughout. For the first 24 hours they worked with a battery, and for the second 24 hours without a battery, as they wished to see what effect this had on the efficiency. During the first 24 hours they ran two motor converters, and during the second 24 hours, when they ran without the battery, they had three machines to take the load. The load on each machine, with the battery, went down to a minimum of 38 per cent. with a maximum of 116 per cent. On the second day, without the battery, the load went down to nothing, and they also had 32 per cent. overload. The fluctuation of the high-tension voltage produced by this big variation was ±2·7 per cent. On the second day this was ±6·8 per cent. The mean load on the generators on the first day was 75 per cent. and on the second day 45 per cent. The efficiencies (high-tension a.c. input, to d.c. output) for the converters alone were 89 per cent. and 82 per cent. respectively. He thought that the latter was very high for a load that sometimes dropped to nothing. The overall efficiency of the sub-station on the first day (including the battery losses) was 75 per cent., and on the second day 82 per cent. On these tests they were not working the lighting load off the same bus-bars. Thus, the figures given related entirely to a traction load of the very worst character, as there were usually only three trains being supplied from the sub-station with a maximum of five. This figure of 82 per cent. compared directly with the motor-generator sub-station efficiency of 75 per cent. mentioned recently in Mr. Rider's Paper.

Mr. T. Roger Smith (Great Western Railway Co.) said that the property of the motor converter of giving leading currents above a certain value of the load had proved to be most important; in the Great Western sub-stations the current was always leading. On very high peaks the power factor fell as low as 92 per cent., but under ordinary conditions it was 98 per cent., and these leading currents rendered it much easier to keep a steady voltage at the generating station bus-bars. Another excellent feature of the motor converters was their overload capacity. During the running of the Exhibition traffic last year it was quite common to have them all overloaded 60 per cent. for a short period, as the Highfield reversible motor booster did not reverse quickly enough to take up the load directly it came on. Without this valuable overload capacity, motor converters would not be nearly so successful as they were when working with batteries. Since the Paper had been announced he had carried out an eleven days' test at the Shepherd's Bush sub-station, and he would publish the full results in the journal. He would say, however, that the daily average input over the eleven days was 15,500 kws., the daily battery charge 1,730 kws., and the discharge 1,630 kws. Thus 12 per cent. of the whole energy coming out went through the battery, and the loss in the booster and battery was 5 per cent. These were all average figures. The daily machine load factor was 51 per cent., and the daily machine efficiency 83·5 per cent. This was considerably lower than the figure of 89 per cent. mentioned by Mr. Jenkin, but this latter referred to another sub-station. This was rather an interesting point in connection with these results; at the sub-station, which had a machine efficiency of 89 per cent., the battery was of 1,000 kws. maximum capacity, but at the sub-station with an efficiency of 83·5 per cent. the maximum capacity of the battery was only 500 kws. The commercial efficiencies from the a.c. input to the d.c. output to the track were almost exactly the same in both cases, namely, 78 per cent. with the big battery and 79 per cent. with the small battery. Therefore they got the interesting result that in this individual case it did not pay, from the point of view of efficiency, to put in a very large battery. The higher efficiency got out of the machines in the first case was all lost by conversion in the battery. In conclusion, he mentioned that if the Great Western job had to be done all over again, not only the people who had to pay for the machinery, but also the people who had to work it, would all wish to have motor converters.

Mr. A. H. Seabrook (Chief Electrical Engineer, West Ham Corporation), speaking with regard to the reliability of rotary converters, said that on the West Ham 50-period system they had about twelve sub-stations, of from 200 to 1,000 kws. capacity; three of these were rotary converter sub-stations, and one ran continuously day and night. One man did the whole of the attendance, repairs, and maintenance of these sub-stations. They had various makes of machines, but he had not experienced the slightest difficulty in running them. He had had no trouble with starting up, and, with regard to reversal of polarity, a double-pole switch and a voltmeter were all that was necessary to get over the trouble. He knew of a rotary converter installed last year at Barking which was running day and night from the d.c. side, giving a.c. output, with which there had not been the least trouble. With regard to floor space, it was quite wrong to say that the motor converter took up less floor space than rotary converters and their transformers. The transformers could be put out of doors, in a cellar, or even on the roof. The capital cost of a motor converter was higher than that of a rotary, the efficiency was lower, and greater attention was required on account of the h.t. current being on the stator windings. In his opinion capital cost was distinctly saved and efficiency gained by putting in rotary converters.

Mr. Frank Bailey (Chief Engineer, City of London Electric Lighting Co.) stated that last year they put into their motor generators at Bankside about 4,719,000 units and got out 3,635,000 units, the overall efficiency being 77 per cent., and he thought the author justified in drawing attention to the importance of a high overall efficiency. He had found that it was not always easy to handle motor generators with sufficient rapidity, and this again was a point in favour of the motor converter.

Mr. J. S. Peck (British Westinghouse Co.) was of the opinion that the higher efficiency and greater reliability of the rotary—because it had no high voltage on the stator windings—and the lower cost of manufacture, would result in it gradually replacing all the types of apparatus. The author had mentioned that the rotary converter had made little progress in this country since 1904, but the company with which he was associated had installed over 160,000 kws. of rotary converters in this period, and a fair proportion of these were between 400 and 500 kws. and for high frequency circuits. Although it was stated in the Paper that the motor converter was patented in 1902 by La Cour and Bragstad the fundamental patent was taken out in 1899 by M. Le Blanc. He believed that all companies manufacturing motor converters to-day recognised that patent in the form of royalties. Starting up a motor converter was not so simple as it would appear; there were three rheostats to be worked, the machine had to be synchronised, and there was always the possibility that the machine might run up to double speed with not quite such satisfactory results as Mr. Jenkin mentioned. Regarding the voltage regulation by field adjustment, they could do everything on the rotary converter that could be done on a motor converter. It was simply a question of putting reactance in the transformer circuit, or outside in the form of choke coils. With regard to floor space, it was possible to get much more power in the same floor space with rotaries than with motor converters, if the transformers could be put in the basement or on a gallery. The efficiency curve given in Fig. 2 was certainly a very fine one, and he would like to know the separate losses that made up this curve, as it seemed to him that such a curve was impossible of realisation unless the machine were built with stalloy steel. He thought the motor converter was hopelessly handicapped owing to a possibility of breakdown in the high voltage stator winding. The switchgear for a rotary converter was not more complicated if they connected the transformer direct, which was a very common practice.

Mr. Hallo, in reply, stated that his point as to the unsuitability of the rotary converter referred particularly to its use on a.c. systems of 50 periods or higher frequency only. On the question of number of poles and speed, the Great Western Railway machines were specially slow speed ones, and had a larger number of poles on the a.c. side than on the d.c. side; but this was not present-day practice. With regard to voltage regulation, Dr. Rosenberg recommended two tappings on the transformers; but in a discussion on a previous Paper on rotary converters, the use of tappings on the transformers was condemned. Tappings could be made on the stator windings of a motor converter as well, and this would give additional regulation. As to Mr. Seabrook's comparison of floor space, the only rational way was to compare the floor spaces taken

Digitized by Google

up by the machines and their accessories. Mr. Peck had mentioned the possibility of breakdown of the stator windings, but during the last three or four years no such thing had happened. The efficiency of the motor converter was very little less than that of a rotary converter and its transformers. Under actual working conditions of varying load and power factor, the difference was not more than one per cent. The efficiency curves in the Paper were not calculated for separate losses, but were actual figures which had been obtained. He had some figures obtained in the Manchester Corporation sub-station for motor converters and motor generators; they did not apply to rotaries, but they were actually higher in the case of the motor converters than those he had given. He had no doubt that Mr. Pearce, the city electrical engineer at Manchester, would be willing to certify them as absolutely correct. They were obtained under actual running conditions, and on machines built for the extremely wide voltage regulation of 30 per cent. A 250 kw. converter at full load gave an efficiency of 89·2 per cent., as against the motor generator's 85½ to 86½ per cent. At quarter load the efficiency of the motor converter was 85½ per cent., and that of the motor generator 74 to 75 per cent. The efficiency of a 500 kw. converter installed there was 91½ per cent. at full load, 91 per cent. at half load, and 87½ per cent. at quarter load.

The following written communications to the discussion have been received :—

Prof. E. ARNOLD (Karlsruhe) writes with reference to the arrangement of the commutating pole windings of a three-wire machine, stating that it appears to him that the extra winding supplied with the middle-wire current may be dispensed with if the main winding is divided into two equal portions, and the one half supplied with the positive, the other with the negative outer-wire current, thus giving a resultant excitation equal to the average of the currents in the outers. He calls attention to the high efficiencies at low loads shown by the curves of Figs. 2 and 4. In conclusion, he refers to an electrochemical works in Ammendorf, Saxony, where there are two motor converters of 900 kw. each converting 500-volt, 50-cycle, three-phase current into direct current at 160 to 175 volts. They run at 214 r.p.m., the induction motor having 12 poles and the d.c. machine 16 poles. As the machines are to run continuously on full load, the 2 to 3 per cent. higher efficiency over that of motor generators means a saving of from £350 to £450 a year.

Mr. T. L. LA COUR does not consider that a mesh-connected rotor would be satisfactory, as, if the wave forms of the two machines are not the same, idle currents will circulate in the windings, and, in the case of the fifth, seventh, and eleventh harmonics, will be considerable with a mesh-connected rotor. With star connection, however, there is very much more inductance offered to these harmonics, and in consequence the currents flowing are negligible. He further comments on the beneficial influences of the large reactance of the motor converter, which tends to prevent flashing over, and reduces the natural frequency of oscillation of the machine to from 75 to 150 oscillations per min., so that there will be no tendency for resonance phenomena to take place between a converter and alternators driven either by reciprocating engines running at 150 to 200 r.p.m., or by steam turbines with more than 200 steam impulses per minute.

Mr. K. FAYE-HANSEN (British Westinghouse Co.), referring to the claim of high reactance in the induction motor, points out that transformers can be designed for any desired reactance. The transformers employed by the Westinghouse Co. for rotary converters have a reactance of from 20 to 30 per cent., and are cheaper and have as good an efficiency as transformers with from 1 to 1½ per cent. reactance as often required for power and lighting. In one case, an auto-transformer having a reactance of over 50 per cent. was designed for a rotary running off a 400-volt three-phase supply, and supplying 425-volt d.c. The reactance of a transformer can also be altered afterwards if necessary. It is difficult, however, to obtain more than 30 per cent. reactance, equal in all three phases, with three-phase transformers with unsymmetrical cores, due to the interlinking of the leakage lines. In conclusion, Mr. Faye-Hansen asserts that the only thing the induction motor can do, and the transformer not, is to alter the frequency of the supply to the rotary; in all other respects, he says, the transformer is better and more efficient.

Mr. H. W. GREGORY asks whether the high efficiency at low loads is due to the low frequency or to the absence of higher harmonics when running light. He also calls attention to the fact that the series booster of a motor converter has to deal with only half of the current in the d.c. armature, and adds that the absence of slip rings carrying heavy currents on the motor converter is a point insufficiently appreciated.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday :—*Members:* Professor C. A. Adams, A. V. Clayton, A. Page. *Associate Members:* A. F. Coates, W. Holmes, E. L. Joseph, A. P. Robertson, E. M. O. Scott, S. P. Smith, G. E. F. Webber. *Students:* E. S. Coombes, J. F. Daniels, V. H. M. McMahon, W. W. Pullen, L. Wallis.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

Seventh International Congress of Applied Chemistry

THIS Congress meets every three years, the first meeting having been at Brussels, and subsequent meetings in Paris, Vienna, Paris, Berlin, and Rome. This is thus the first time that it has met in England. There are seventeen sections and sub-sections devoted to all the various branches of chemistry, and this alone shows what a very specialised science chemistry is. The section of chief interest to our readers is Section X, Electrochemistry and Physical Chemistry. The President of this section is Sir John Brunner, the Vice-President Dr. G. T. Beilby, F.R.S., director of the Castner Kellner Alkali Co., and the secretary is Dr. F. Mollwo Perkin. The work of this section will be very heavy, as already nearly eighty Papers have been promised, and the actual working hours are only 18½.

Many of the Papers are of a very physical chemical nature, but the following list will be of particular interest to practical electrochemists. The Lash Steel Process, by F. A. Fitzgerald, and a Résumé of Work on Electrometallurgy of Iron and Steel, by the same author. A series of five Papers by the well-known French electrometallurgist, Monsieur G. Gin upon the formation of various alloys. The relative efficiency of the Arc and Resistance Furnace for the Manufacture of Calcium Carbide, by S. A. Tucker, W. A. Alexander, and H. K. Hudson. Calcium Carbide, by C. A. Hansen. The preparation of metals of the alkaline earths, by M. Guntz. Passivity of Metals, M. Kistakowsky. Oxidation of Atmospheric Nitrogen by the Badische Anilin and Soda Fabrik. It is hoped to demonstrate this experimentally before the members of the Congress, and show the new spiral arc which is used by this company, who are now working with the Birkeland & Eyde Co. It is also expected that Mr. Eyde will take part in the discussion. There are also four other Papers dealing with this subject. Mr. E. R. Taylor, of America, will read a Paper on the National and International Conservation of Water Power. There are also eight Papers on the subject of thermochemistry. Then there is a Paper on the American Car-Lighting Storage Battery by the American Car Co. These few examples show that anyone interested in electrochemistry or physical chemistry will have a rich and varied fare to choose from.

The Congress will open on May 26th with a social function, a reception at the Mansion House by the Lord Mayor and Corporation. The inaugural meeting is to take place at the Royal Albert Hall at 3 o'clock on May 27th, when the Congress will be formally opened by H.R.H. the Prince of Wales. In the evening there is to be a reception at the Foreign Office. The morning of May 28th is to be devoted to sectional meetings, and in the afternoon Professors Haller and Paterno will give lectures before the whole Congress. In the evening there is to be a banquet in the central transept of the Crystal Palace. This enormous building was chosen, because it is expected that over 2,000 will sit down to dinner, and no other place in London is of sufficient size. Saturday morning will be devoted to sectional meetings. The Ladies' Committee will hold a garden party during the afternoon at the Botanic Gardens, and in the evening the London Section of the Society of Chemical Industry will give a reception at the University of London. Monday, May 31st, will be given up to sectional meetings and a lecture by Professor O. N. Witt, of Charlottenburg. On Tuesday, beside the sectional meetings, Sir Boverton Redwood will give a lecture to the whole Congress, and in the evening there is to be a reception at the Natural History Museum. The Congress closes on Wednesday, June 2nd, and in the afternoon the members will visit Windsor Castle by permission of the King. Sir William Ramsay is President of the Congress, and Mr. Wm. Macnab Secretary, the offices being at the Imperial College of Technology, South Kensington. Gentlemen's membership tickets are 20s., and ladies' 15s.

Automatic Control of Electric Heating Apparatus.—According to the *Electrical World* (New York), an American patent has been granted to Mr. H. Ward Leonard relating to the automatic control of the energy supplied to an electrically heated tool. If an electrically heated flatiron be used to iron damp goods as rapidly as possible, the iron becomes chilled, and if this difficulty be overcome by increasing the watts, then when the iron is idle it is likely to become destructively overheated. The object of the invention is to allow a variation of the current, automatically controlled as needed to maintain a definite temperature irrespective of whether the iron is idle or is being worked. The invention provides in the flatiron, in addition to the heating wire, an auxiliary controlling resistance of nickel or other material whose resistance responds immediately to a change of temperature. This change of resistance affects an exterior automatic, magnetically controlled switch in series with the controlling resistance, and the automatic switch is caused to vary the heating current as required.

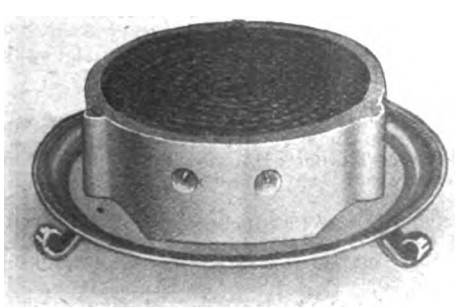
CATALOGUES AND PAMPHLETS, &c., RECEIVED



[READERS APPLYING TO ANY OF THE UNDER-MENTIONED FIRMS FOR COPIES OF THE CATALOGUES OR PAMPHLETS REFERRED TO ARE REQUESTED TO MENTION "ELECTRICAL ENGINEERING."]

STARTERS, CONTROLLERS, FANS, ELECTRICAL SUPPLIES, AND TELEPHONES.—The Electric & Ordnance Accessories Co., Ltd., of Birmingham, have sent us copies of a series of new catalogues, conveniently arranged in a cover, which deal with a large range of electrical and engineering apparatus. The controller section describes controllers of the magnetic blow-out pattern for cranes, traction, machine-tool drive, and other purposes, for both continuous current and polyphase motors. The motor starters listed include several varieties; the "Autograd" starter, designed to prevent switching on too rapidly (see ELECTRICAL ENGINEERING, Vol. IV., Manchester Exhibition Supplement, p. 15), and complete ironclad motor starting panels are also listed in great variety, fitted with a special form of combined quick-break lever switch and fuse. The fan sections include the well-known "Ordnance" propeller fans and the larger centrifugal or cased fans up to considerable sizes. Both metal filament and carbon lamps are listed, and the number of installation accessories, such as tumbler switches, ceiling roses, plugs, &c., is too large for us to particularise the items. Another section is devoted to watertight fittings, &c., and one of the special features of the series is the completeness of the portion dealing with high- and low-tension porcelain insulators, &c., manufactured at the company's own works at Hanley, which includes almost every variety of porcelain apparatus required in the electrical industry. A leaflet is included describing new apparatus known as the Warner cut-meter for determining the cutting speed of machine tools. This consists of a magnetic tachometer, which can be held in the hand, actuated by a small rubber-tyred friction pulley intended to be pressed against the work when running. The graduations are directly in feet per minute. The final section of this interesting, well-arranged, and well-printed series of catalogues is devoted to telephones, and contains particulars of central battery exchange instruments, intercommunication, and central station telephones, reply and call telephones, short-distance telephones, &c., and a considerable variety of telephone fittings and accessories.

ELECTRICAL SHOT FIRING.—An attractively arranged new catalogue from the Sterling Telephone & Electric Co., Ltd., of 200 Upper Thames Street, contains particulars of the Sterling patent electric blasting apparatus, and a quantity of useful information upon the subject of electrical shot firing, to which the company have given a good deal of attention. A number of varieties of these machines are made for use under different conditions. For low-tension firing a "dynamo" exploder is used, which is practically a complete miniature series machine, but magneto machines for the high-tension system are also made. The machines are strong and compact, and worked by a simple twist of the handle. Enamel-covered wire is used in their construction, and both field magnets and armature are laminated. The machines are made either in oak or metal cases. The same list contains details of various accessories, and also deals with mine signalling apparatus, including special telephones, bells, &c., of a waterproof nature, an electric syren, water-tight signalling keys, and other pieces of special electrical apparatus for mines.

NEW ELECTRIC HEATER

A NEW pattern of electric heater has been put on the market by Messrs. Bray, Markham & Reiss, Ltd., of Blackhorse Lane, Walthamstow, under the name of the "Wilkinson" economic electric stove. This apparatus, which is illustrated in the accompanying figure, was designed by Mr. F. A. Wilkinson, chief electrical engineer to the St. Marylebone Borough Council, and has some novel features. It comprises a porcelain ring within which are two earthenware discs; the upper disc has a spiral groove on top, in which is laid a helix of non-corrosive wire. This helix is held to the disc by clips at short intervals, and the extremities are connected to two pins, the ends of which are fixed into the disc. The pins project into holes cut in the porcelain ring, as shown in the figure, and are thus protected from short-circuit when connected up. Two plugs are provided, which fit over these pins. An expanded metal top protects the heater from injury, while allowing at the same time the emission of radiant heat. When working, the wire helix is raised to a dull red heat, and can consequently be used for toasting. The apparatus is especially adapted for use with ordinary household utensils, such as kettles, saucepans, and frying-pans, and will boil one quart of water in about 14 minutes, the consumption during this time (at about 700 watts) being approximately one-sixth of a unit. It can also, of course, be used for heating flat-irons. The only metal portions are the wire helix and the expanded metal cover, and the absence of a solid plate on top is claimed to result in a higher efficiency. Among the other advantages claimed are cleanliness and cheapness; the complete apparatus is listed at 16s. 8d. When it is required to use it over a tablecloth, a light aluminium tray is necessary; and in order that it may be used as a radiator for rooms, a light aluminium stand, into the top of which is placed the heater, has been designed. In this case also, the red-hot wire helix is visible from the top. The apparatus is suitable for both direct and alternating current, and can be obtained for any pressure up to 250 volts; the 240-volt size takes 3 amperes, the 100-volt 7 amperes, the consumption being in all cases about 700 watts. Several of these heaters are working, and have given every satisfaction, and we understand that a certain supply company has placed an order for one hundred and fifty. A feature of the apparatus is that it can be readily taken to pieces and cleaned, or a new heating element inserted without any fear of deranging the electrical connections.

THE "WILKINSON" HEATER ON A TRAY FOR TABLE USE.

Cable Makers' Association.—The firm of Messrs. Charles Macintosh & Co., Ltd., of Derby, with which is merged the firm of Messrs. William Rickard, Ltd., have ceased to be members of the Cable Makers' Association.

Glasgow Section of the Institution of Electrical Engineers.—The annual report of the section, which was submitted to the general meeting on May 11th, records the holding of seven meetings, an annual dinner, and a smoking concert. The membership (including students) is now 290. The following are the officers and committee for the next session:—Chairman, Mr. E. G. Tidd (Messrs. Morris, Warden & Co.); Past Chairmen, Prof. Francis G. Baily (Heriot-Watt College, Edinburgh) and Mr. W. W. Lackie (City Electrical Engineer, Glasgow); Vice-Chairman, Mr. W. M'Whirter; Chairman of Students' Section, Mr. H. A. Mavor (Messrs. Mavor & Coulson); Hon. Sec. and Treasurer, Mr. J. E. Sayers; Members of Committee, Messrs. J. K. Stothert (Messrs. Babcock & Wilcox, Ltd.), J. Taylor, R. Robertson (Messrs. Robertson & Struin), J. A. Robertson (Borough Electrical Engineer, Greenock), Dr. J. T. Bottomley and Dr. Magnus Maclean (Glasgow University), Mr. Sam Mavor (Messrs. Mavor & Coulson), Councillor W. C. Martin, and Mr. C. M'Millan (Electric Control, Ltd). In order to promote the social side of the Section, the Council have this year arranged to combine with the West of Scotland Iron and Steel Institute in an all-day excursion. For this purpose the s.s. *Duchess of Hamilton*, of the Caledonian Railway Company, has been chartered for Thursday, June 17th. The students' section report the discussion of six Papers and a number of visits to works.

Llynvi Valley Colliery Electrical Equipment.—In 1905, Messrs. O. H. Thomas, Son & Co., colliery proprietors, of Neath, entered into a contract with the Electrical Co., Ltd., to substitute electric pumping for the then existing steam pumping in their Llynvi Valley Colliery. While the work was being carried on, the mine became flooded, and the completion of the work was delayed until April, 1908, whereas under the original contract it should have been completed in December, 1905. The Electrical Co. brought an action to recover £2,976, including £1,035 due under the contract, £51 for additional goods, and £1,890 for work in connection with pumping out the colliery. The defendants admitted that the first two sums were due, but disputed the third, and counterclaimed for £31,707, mainly for losses due to the delay which, they say, was also the cause of the colliery becoming flooded. The Electrical Co., on the other hand, claim that the delay was due to causes over which they had no control. When the case was referred to Mr. Justice Walton, he directed that the action should be tried before the Official Referee, but this decision was appealed against by the colliery proprietors, who desired that the case should be tried in Wales before a Cardiff jury familiar with colliery matters. When referred to Lord Justices Moulton and Farwell in the Court of Appeal, the former held that, having regard to the nature of the case, Mr. Justice Walton had done right in referring the case to the Official Referee, and, Lord Justice Farwell concurring, the appeal was dismissed with costs.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 6th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

7,645/08. **Meters.** W. Fennell and W. P. Perry. A current-limiting switch is combined with a meter and a switch for limiting the quantity of energy taken, and the former is fitted with a pointer and scale accessible to the consumer to enable him to increase the current limit, as described in Specification No. 7,644/08. When the meter shows that the amount contracted for has been consumed, the "quantity-limiting switch" may be reset, and a second amount taken, which can be charged for at a lower rate. A quantity-limiting switch for use on this system is described in Specification No. 7,646/08. Three claims, one figure.

15,013/08. **Motor Starter.** G. C. Fricker. This motor starter, which ensures the gradual starting up of a motor, comprises a high-resistance solenoid connected across the motor armature and a plunger partially immersed in mercury. The motor is switched on with a starting resistance in series, and as the speed rises, the pressure across the solenoid increases and the plunger is drawn into the mercury. The mercury rises and successively makes contact with wires dipping downwards into the mercury chamber, which short-circuit portions of the starting resistance in succession. When the motor has attained full speed the mercury reaches the top contact and cuts out all resistance. For motors taking more than fifty amperes, it is proposed to connect relays to the mercury contacts, which relays will operate solenoid switches for cutting out the starting resistance. Four claims, three figures.

21,959/08. **Production of Oxides of Nitrogen.** I. Moscicki. This is an apparatus for the fixation of atmospheric nitrogen, in which the arc is struck between two water-cooled electrodes fixed to the opposing faces of a powerful electromagnet, and is blown out into the form of a rotating flame. Previously cooled auxiliary gases or vapours, such as water vapour or gases enriched with nitrogen, are introduced on to the opposite side of the flame to that on which the air is introduced. This prevents the arc from shortening itself by deflecting on to the faces of the magnet. Two claims, two figures.

27,536/08. **Multiple-carbon Arc Lamps.** A. Holman. A number of carbons are carried in one holder and are opposed by an equal number of carbons in another holder, the arc burning across opposing pairs of carbons in succession. Each carbon holder is attached to a swinging arm supported from the upper plate of the lamp, and springs are provided to draw the carbons together. To strike and regulate the arc, a wedge is moved in between two quadrants fixed to the swinging arms, as in the case of the lamp with disc electrodes described in Specification No. 2,261/08, and referred to in the adjacent column under "Opposition." The movement of the wedge is controlled by the usual shunt and series solenoids. By dividing the carbons in each holder into equal numbers of positive and negative carbons, and opposing those of opposite sign, two arcs are struck in series, and such a lamp will burn singly on a 120-volt circuit without a shunt coil. Six claims, five figures.

7,203/09. **Cooling of Enclosed Machines.** Akt.-Ges. Brown, Boveri & Co. According to this invention, a totally enclosed machine is provided with a special foundation having openings coinciding with similar openings in the base of the machine. The rotor of the machine sets up a continuous circulation of the air through the machine and the hollow foundation, and ribs or coils with water circulating through them are placed within the latter to cool the air. Three claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Jandus Arc Lamp & Electric Co., and Jones, 16,151/08.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Schroier [Device for attaching wires to insulators] 27,075/08.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Balancing end-thrusts in electrical machines] 1,651/09; Volkers [Rotary permanent-magnet field systems] 6,187/09.

Electrometallurgy and Electrochemistry: Steynis [Production of ozone] 24,823/08.

Ignition, Electric: Humphrey, 8,966/08; Wild [Sparking-plug] 21,757/08.

Incandescent Lamps: Triquet [Tool for picking up and holding filaments by suction] 13,449/08; Van Raden & Co., and Metz [Lamps for portable cells] 15,979/08; Sefton-Jones (*Kuzel*) [Repairing metal-filament lamps] 20,715/08.

Instruments and Meters: Bevis and Penicud [Inking device for recording instruments] 20,634/08; Francois [Instruments] 7,198/09.

Storage Batteries: Carpenter, 8,794/08.

Switchgear, Fuses, and Fittings: Lillicrap [Switches] 8,752/08; Gunning [Rotary interrupters and switches] 8,863/08; Donati [A.C. regulator] 10,577/08; Fennell and Perry [Lamp-holders] 13,230/08; Pierce [Lamp-stand] 21,602/08; Highfield [Lamp supports and casings] 27,991/08; Green [Lamp-holders] 2,106/09.

Traction: Bowring [Tramcar life-guards] 8,445/08; Wermann [Overhead collector] 9,099/08; Merz and Redman [Conductor rails] 11,347/08; Tierney and Malone [Point shifting] 12,923/08; Kompe [Trolley head] 22,168/08.

Wiring Systems: Vaughan and Birch [Metallic fittings for continuity system] 9,537/08; Evans [Slip-socket fittings for continuity system] 14,656/08; Reinhardt and Weil [Conduit T-pieces] 19,286/08.

Miscellaneous: Gerard [Production of electrical effluvia] 1,253/08; McWhirter [Water-level indicator] 8,920/08; Bayer [Synchronous operation of cinematographs and phonographs] 11,333/08.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

C. Wüst et Cie [Locking device for switch boxes] 4,561/09; Venning [Tramway frogs and crossings] 7,795/09; Mahoney and McCurdy [Magnetic brakes] 8,521/09; Freeman [Printing-press controllers] 9,052/09; Monasch [Production of electro-magnetic oscillations] 9,427/09.

Amendment Made

8,851/07. **Variable-speed Polyphase Motor.** H. A. Mavor and Mavor & Coulson, Ltd. The drawings of this specification have been amended. (*See* Electrical Engineering, March 4th, page 215.)

Opposition to Grant of Patents

Opposition to grant on the following applications has been entered.

2,261/08. **Arc Lamp.** A. Holman. The electrodes of this lamp are carbon discs supported on pivoted insulated arms, the discs being set at an angle of about 30°. As the carbon is consumed the discs are rotated. Means of striking and regulating the arc by moving a wedge in between two quadrants fixed to the arms are claimed, as well as pawl and ratchet or worm wheel motions for rotating the discs.

9,851/08. **Railway Signalling.** A. J. Boult (*Union Switch & Signal Co., U.S.A.*) This is a system of block signalling for electric railways in which the track rails are electrically continuous. The track-rails are divided into block sections for signalling purposes, however, by supplying adjacent sections with A.-C. currents differing in phase. Methods of obtaining this phase-difference, and relays for use on this principle are described in the specification.

In consequence of opposition, the right to a patent on the following application has been surrendered.

23,988/07. **Tungsten Compound.** F. Harrison and C. H. Dorman. A process is described, for producing a compound of tungsten, carbon, and hydrogen, by reducing tungstic acid in a current of hydrogen and alcohol vapour. An abstract of this specification was given in Electrical Engineering of December 3rd, 1908, Vol. IV., p. 740.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: A. Kronstein [Insulating materials] 1,387/01.

Dynamos, Motors, and Transformers: F. A. Johnson [Variable-speed motors] 1,380/98; G. Pott and R. Williamson [Balanced vertical-shaft motor for centrifugal machines] 1,587/02; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Control of A.-C. repulsion motors] 1,481/04 and 1,482/04.

Electrometallurgy and Electrochemistry: A. A. Naville, P. A. Guye, and C. E. Guye [Production of nitric acid] 1,401/96; A. J. Boult (*Société E. Giraud et Cie.*) [Chain-welding machine] 1,276/00.

Ignition, Electric: C. A. McEvoy and Siemens Bros. & Co. [Discharging submarine mines] 1,330/96.

Switchgear, Fuses, and Fittings: T. S. Perkins [Traction-motor controller] 1,874/02; British Thomson-Houston Co., E. B. Wedmore, and J. Whitcher [Remote-control H.-T. cell-type switchboard] 1,642/04.

Telephony and Telegraphy: S. P. Thompson [Coherer for wireless telegraphy] 1,687/98.

Miscellaneous: W. Chadburn [Ships' telegraphs] 1,372/97; C. Berst [Tell-tales] 1,690/02; H. G. Prested [Electric miners' lamp with gas detector] 1,416/03.

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** *weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.*

SUMMARY

We publish some figures showing the development of the St. Marylebone Borough Council electricity undertaking during the past three years. The number of consumers has increased by 14·4 per cent., the rate of increase being practically constant; the number of units sold increased by 26·4 per cent. in the first year, but by only 2·4 per cent. in the last year, owing to the introduction of metal filament lamps. The total number of units sold for all purposes last year amounted to over 9 millions. (Page 455.)

A Committee of the House of Commons had under consideration last week the Bill of the National Electric Construction Co., which seeks to substitute the overhead system for the surface-contact system originally agreed upon between the company and the respective local authorities in Folkestone. A short length of conduit will be laid on a road over which Lord Radnor is Lord of the Manor. The Lorain surface-contact system is relied upon by the opponents to the Bill as being a satisfactory one, and this led to the calling of Mr. C. E. C. Shawfield, Chief Electrical Engineer to the Wolverhampton Corporation, who have had this system in operation for several years. (Page 456.)

The full programme of the fourteenth annual convention of the Incorporated Municipal Electrical Association, which will be held in Manchester from June 21st to 25th, has been issued. The Presidential Address on the first day will be followed by a Paper on "Cheap Units," by Councillor Sinclair. On the second day Papers on "The Effect of Metal Filament Lamps on the Electrical Industry" and "Modern Cable Systems" will be read by Mr. E. E. Hoadley and Mr. E. M. Hollingsworth respectively, and on the third day (Thursday) Papers on turbines and condensing plants will be read by Mr. A. S. Blackman and Mr. E. Lunn. The annual general meeting will be held on Friday, June 25th. (Page 457.)

In a Paper read before the Glasgow Section of the Institution of Electrical Engineers last week, Mr. W. B. Hird dealt with the application of interpoles to machines of normal design, and pointed out that full advantage was not taken of the increased armature lengths made possible by this means. The consequent

Digitized by Google

increased heating would, however, lead to forced ventilation, to which he saw no objection. In the discussion following the Paper Mr. W. W. Lackie referred to the difficulty of running interpole machines in parallel with ordinary shunt machines. Mr. H. A. Mavor and Mr. J. R. Barr were of the opinion that in most cases it would still be better to avoid interpoles. (Page 457.)

SEVERAL Papers of interest to electrical engineers were read and discussed at the annual meeting of the Iron and Steel Institute on Thursday and Friday last. Of three Papers on the corrosion of iron and steel, two dealt with the problem on the assumption that it was essentially an electrolytic action, and some interesting conclusions with regard to the methods to be adopted to prevent corrosion were arrived at. A Paper by Mr. W. Rodenhauser described the Röchling-Rodenhauser induction furnace and its application to the manufacture of high-grade steels. Some important points were brought up in the discussion of this Paper, including the power factor and the efficiency of electric furnaces. Mr. Frick also gave particulars of his new furnace, the German patents for which have been acquired by the firm of Krupp. Another Paper described the Ekenberg process for converting peat into fuel without air-drying. The Bristol recording pyrometer, in which the usual platinum thermo-couple is replaced by an inexpensive couple giving a large E.M.F., was described in another Paper. (Page 459.)

A NOVEL electric stove and an automatic transformer switch are described on page 462.

A PATENT specification by A. Wermann describes a double-star shaped trolley contact which passes obstacles without any tendency to leave the contact wire, and another by C. H. Merz and S. G. Redman relates to the construction and protection of conductor rails. The rail is rolled with an I section, but has an enlarged head, from the under surface of which the current is taken. The Jandus Arc Lamp and Electric Co., and A. D. Jones have a specification describing an arc lamp mechanism for vertically arranged carbons, in which all the moving parts are supported at the fulcrum of the regulating lever. To ensure steady burning, this is provided with ball-bearings. Among the other specifications abstracted is one by J. S. Highfield for a dust-tight ceiling lamp fitting with spring-supported lamps. The opposition to the grant of a patent to H. Aron for a battery meter with dials to indicate the maximum rates of charge and discharge has been effectual, but a patent applied for by F. J. Planchon for a process of manufacturing filaments from an albuminoid compound of tungsten, which was opposed, has been granted. (Page 463.)

THE Rawtenstall tramways, comprising some seven and a half miles of mostly reconstructed track, were opened for public service on Saturday last. The power station, which also supplies current for lighting purposes, contains three 270-kw. steam sets and a 560-ampere-hour (ten-hour rate) battery. Two outlying districts are supplied with A.C. current at 3,000 volts by means of an inverted rotary-converter and transformers, the former running off the battery at night, when it also serves as a balancer on the D.C. three-wire lighting system. An interesting feature of the overhead equipment is the substitution of bare wire for cables between the trolley-wire and the pole heads at feeding points. The cars are provided with regenerative control on the Raworth system. All track joints, except those at points and crossings, are Thermit-welded. (Page 465.)

THE Goldsmiths' Company have made a gift of £50,000 to the Governors of the Imperial College of Science and Technology, to be devoted to the engineering department. (Page 466.)

ACTING under the powers of the London Electric Supply Act, 1908, the London borough councils owning electricity works and the London electric supply companies have appointed a Committee of twelve, consisting of six representatives of the municipality and six of the companies, as a preliminary step to drawing up a scheme for linking up their undertakings. Dr. H. Mansfield Robinson, Town Clerk to the Shoreditch Borough Council, and Mr. H. B. Renwick, general manager and secretary to the County of London Electric Supply Co., are joint secretaries. (Page 467.)

THE proposal of the London United Tramways Co. to obtain Parliamentary powers for running over certain lines of the London County Council has been rejected. The North West London Railway Bill has been rejected. The Baker Street and Waterloo Railway Bill has been withdrawn. A Bill to extend the Central London Railway from the Bank to Liverpool Street is under consideration by a House of Commons Committee. (Page 467.)

IT is proposed to transfer £29,000 to relief of rates from the Birmingham tramway profits and £10,000 from the electricity profits. The Gillingham Council proposes to put in a Diesel oil engine set to deal with the day load. The Rhyl Council also propose to put in a Diesel engine for this purpose. The electricity accounts of the Belfast Corporation show a net profit of £9,270 for the year to March 31st. There is a deficit of £2,747 upon the Burton Corporation tramway accounts for the past year. The Darlington Electricity Committee propose to hand over £2,000 to relief of rates. A scheme for supplying Bethnal Green with electrical energy is being prepared by the Hackney Borough Council. (Page 468.)

LOCAL GOVERNMENT BOARD inquiries have been held at the following:—Bridlington (£5,000), Cleethorpes (£4,000), Hereford (£8,000), Middlesbrough (£10,000), Watford (£5,000), and Finchley (£2,200). A 1,000 kw. generating set is required by the Melbourne Corporation, and eight sections of a common battery switchboard by the Melbourne Deputy Postmaster-General. Electric cranes are to be installed at the Dunedin (N.Z.) Harbour. (Pages 469 and 470.)

THE accounts of Callenders' Cable & Construction Co. for 1908 show a net profit of £72,134. A dividend of 10 per cent. is proposed upon the ordinary shares. There is a loss of £6,521 upon the year's working of the British Westinghouse Company. (Page 470.)

A 100-VOLT 16-c.p. tungsten lamp with a small bulb has been placed on the market. (Page 472.)

IN his Paper on the economics of medium-sized power stations, read at last Thursday's meeting of the Institution of Electrical Engineers, Mr. A. J. J. Pfeiffer put in a plea for the employment of Diesel oil engines. He worked out comparative estimated costs as against gas and steam for a 1,600-kw. station for various load factors, and also for a group of isolated Diesel stations, compared with a system with one large steam and several sub-stations. A few details of the working of this form of engine were also given. In the discussion, Mr. J. H. Rider pointed out that the author's figures for sub-station costs, &c., were much higher than average practice. Mr. W. B. Esson mentioned some examples of the saving that had been obtained, and Mr. H. L. Dixon spoke of his experience with Diesel engines at Leatherhead. Mr. Handcock referred to the success of his own and some other small Diesel engine installations, and, in conjunction with Mr. H. M. Sayers, expressed regret at the uncertainty in the price of oil fuel, a fact which, according to the latter, had in conjunction with the high price of the Diesel engine, greatly militated against its extensive adoption. Mr. L. Andrews disagreed with some of the author's comparative figures, and Mr. H. S. Russel dealt with some of the differences in the arrangement of the engines made in this country and on the Continent. Mr. W. H. Booth also spoke. (Page 473.)

Digitized by Google

The discussion last Thursday at the Institution of Electrical Engineers threw a good deal of interesting light on a development in electric supply which has been proceeding at a greater rate than is always realised. The Diesel engine, which was so stoutly championed in Mr. Pfeiffer's Paper, is already in use in quite a considerable number of small main and auxiliary generating stations with a degree of success evident from the remarks of all those speakers in the discussion who had had actual experience in their working. Whether—as Mr. Pfeiffer endeavoured to prove with an array of estimated costs—groups of twenty or more small stations driven by these engines can form a cheaper scheme than a large steam station with outlying sub-stations, is a different matter, and requires for its demonstration something more than figures, for, as Mr. Rider pointed out, figures of this nature have a remarkable degree of flexibility. Moreover, some speakers rightly complained that the vagaries of the price of oil, according to whims of the controllers of the American market, form a serious cause of uncertainty in the economic aspect of the question, but, at any rate, such uncertainty as may have existed as to whether the engine was as reliable in practice as it is efficient in theory has been dispelled as its performances have become known.

The full programme of the Convention of the Incorporated Municipal Association next month will be found on a later page, and it is evident that the meeting will afford a good opportunity for discussing many matters which are of particular interest to supply station engineers at the moment. Chief among these is the topic to be introduced by Mr. E. E. Hoadley, namely, the influence of metal filament lamps upon the electrical industry in general, and upon street lighting in particular. There are many aspects of this question which will doubtless be considered from different points of view, as the speakers at Manchester will be drawn from various parts of the United Kingdom, and will have experience of various conditions. There will probably, however, be few cases showing a diminution in the lighting output in so striking a manner as the curves and figures relating to the Marylebone undertaking, which we publish this week. There, in spite of a large increase in the power load and in the number of consumers during 1908, the total number of units supplied from the electricity works rose only 2·4 per cent. Of course, the effect is only temporary, and, as the economies of the new lamps are more and more appreciated by the general public, the increase in electric lighting must continue at a far more rapid rate than it did when lamps consumed nearly three times as much electrical power; and the higher standard of illumination to which the citizen is now accustomed will also help the electricity works. In the meantime, however, the lower annual consumption per consumer is also serious from the point of view of capital cost, as the capital outlay per unit per annum would naturally increase from year to year with the growing advent of the smaller consumers. The high cost of each consumer's service connection must be reduced, and we are convinced that a very material reduction is possible. It must not be forgotten by pessimistic arithmeticians, however, that although the capital cost of the services per unit per annum has been increased, the cost per unit per annum of the distributing mains themselves and the feeders will gradually diminish owing to the larger number of consumers and the more even distribution of the load on the cables. This may seem a small matter at first, but its importance will gradually grow, and, if reasonable progress is made in reducing the cost of service connections, we foresee a substantial reduction in the capital cost of the cables and distributing system per kw. in a few years time.

As we go to press we have received from the G.B. Surface Contact Company a copy of the final report of Mr. W. M. Mordey on the working of the G.B. system on the L.C.C. tramways. In this Mr. Mordey meets the objections raised against the system by the Chief Engineer and Chief Officer of Tramways to the Council, and repeats his opinion that the trial runs which he conducted revealed nothing that was not obviously capable of easy remedy. We shall publish the report and the summary of defects and remedies with which it is accompanied in our next issue. In the meantime, the tender for the reconstruction of the line on the conduit and overhead systems has been let, and the removal of the G.B. studs has been proceeding during the past fortnight.

ARRANGEMENTS FOR THE WEEK

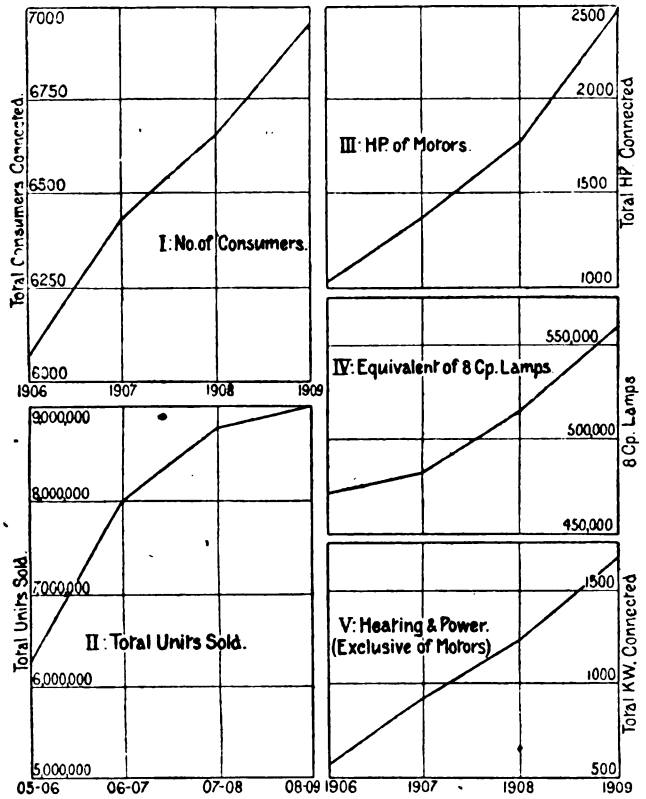
(TO-DAY) THURSDAY, MAY 20TH.
Institution of Electrical Engineers.
8 p.m. Annual General Meeting at the Royal Society of Arts, John Street, Adelphi.
8.30 p.m. Ordinary General Meeting. Paper to be read :—"Some Tests and Uses of Condensers," by W. M. Mordey (President).

FRIDAY, MAY 21ST.
North-East Coast Institution of Engineers and Shipbuilders.
7.30 p.m. Annual General Meeting at the Literary and Philosophical Society, Westgate Road, Newcastle-on-Tyne.

SATURDAY, MAY 22ND.
Institution of Mining Electrical Engineers.
6 p.m. Meeting at the University College of South Wales, Cardiff, to form a local section of the Institution, and to elect representatives for the Council.

MONDAY, MAY 24TH.
Institution of Electrical Engineers: Newcastle Section.
8 p.m. Annual General Meeting at the Armstrong College, Newcastle-on-Tyne. After the annual meeting Mr. Sörensen will read a paper on "The Wireless Telegraph Installation at Cullercoats."

WEDNESDAY, MAY 26TH.
Electro Harmonic Society.
4.30 p.m. Annual General Meeting at the Institution of Electrical Engineers, 92 Victoria Street, S.W.
Royal Society of Arts.
8 p.m. Ordinary Meeting. Paper to be read :—"The Manufacture of Nitrate of Lime from Atmospheric Nitrogen," by Sam Eyde.



PROGRESS OF THE MARYLEBONE ELECTRICITY UNDERTAKING

THE supply of electricity in Marylebone has now been in the hands of the Borough Council for over three years, and it is interesting to note what progress has been made in this period. Through the courtesy of Mr. F. A. Wilkinson, Chief Electrical Engineer to the Council, we are enabled to reproduce some curves which show the development of the undertaking within these three years, and the present condition as shown by the statistics for the month of March of this year.

Curve I. shows that the net number of consumers connected rose from 6,076 in March, 1906, to 6,951 in the corresponding period of 1909, which gives a total net increase of 875, or 14·4 per cent. The rate of increase during this time has been approximately

Digitized by Google

constant. The total number of units sold annually for all purposes is plotted in Curve II., which shows that this increased by approximately 2,700,000, or 42·3 per cent., the number of units sold in the past year being over 9 million. This curve shows, in a striking manner, the effect on the output of the introduction of metal filament lamps, for, while the number of consumers rose steadily at a constant rate, the number of units sold increased only 2·4 per cent. in the last year as against 26·4 per cent. in the year ending March, 1907, and probably the 2·4 per cent. increase is entirely accounted for by the addition to the motor load. In connection with this curve, it may be mentioned that

CURVES SHOWING PROGRESS OF MARYLEBONE ELECTRICITY UNDERTAKING.

the estimated figure for the year ending March, 1910, is ten million units.
